London Electric Railway Co.—152 ordinary shares of £10 each, fully paid (Nos. 36,358 to 36,509).

London & Suburban Traction Co., Ltd.—The revenue for 1919 was £37,395, against £46,294 for 1918, plus £7,092 brought forward. Deducting all expenses chargeable to revenue, including debenture and loan interest, and providing for the sinking fund charges upon the 5 per cent. debenture stock, £1,205 remains to be carried forward. The increased costs of working have compelled the associated tramway companies to deposit Bills in Parliament seeking authority to increase their maximum powers of charge. Lord Ashfield has rejoined the board and been elected chairman.

Commonwealth Edison Co.—The report for 1919 shows: Electric operating revenues, $30,366,426; expenses (including amortisation and depreciation, $2,880,254), $19,519,506; net electric operating revenues, $10,846,919; uncollectable operating revenue, $119,938; taxes, $2,355,000; municipal compensation, $895,193; net operating income, $7,476,787; other income, $619,801; gross income, $8,096,589; deductions from gross income, $950,213, leaving $7,146,375; interest on funded debt $2,299,236; dividends paid, $3,942,340; balance carried to surplus, $904,798.—*Financial Times.*

Dudley, Stourbridge and District Electric Traction Co., Ltd.—Dividend 4 per cent. on the ordinary shares for 1919. £1,000 to reserve; £2,000 to renewals; £65 carried forward.

Potteries Electric Traction Co., Ltd.—Capital expenditure during 1919, £3,908. Revenue £252,438, or £46,304 more than 1918. The expenses have increased by £51,590, although many repairs and renewals have again been deferred. After deducting all expenses, including debenture interest, and £15,000 for renewals, £20,000 is put to reserve, 5 per cent. is paid on the preference shares, and 5 per cent. on the ordinary, leaving £12,082 to be carried forward. Owing to repeated wage advances and the higher cost of materials, expenses have very largely increased. Gross receipts have also increased by reason of higher fares and other causes. "Wages continue to advance, and the raising of additional revenue becomes more difficult." The Bill deposited by the Corporation to confirm the agreement of sale of the undertaking to the Stoke-on-Trent Corporation was withdrawn, as it failed to obtain the necessary approval of the ratepayers.

Karachi Electric Supply Corporation, Ltd.—This company held an extraordinary meeting at Karachi on April 10th, when it was resolved to increase the capital from ten lakhs to 30 lakhs of rupees. Three lakhs were to be offered to existing shareholders at par. The chairman, Mr. M. de P. Webb referred to the prospects ahead, especially with regard to demands for energy for industrial purposes. In addition, over three hundred applicants for energy for lighting purposes were waiting to be connected. Three lakhs of rupees were required at once to pay for the three new large engines and dynamos, two of which were now on their way from England to Karachi. The managing agents have under preparation a scheme for a greatly enlarged generating station to be equipped with steam turbo-generator, each of 1,000 KW.—that is, each will be larger than the entire capacity of the present plant. Industrial enterprises in and around Karachi are expected to be greatly stimulated as a result.

North of Scotland Electric Light & Power Co., Ltd.—The result of working during 1919 is satisfactory considering the conditions. In Montrose, connections increased from 1,217 KW. to 1,555 KW.; Brechin from 857 to 908 KW.; Inverness from 1,996 KW. to 2,088 KW.; total 4,551 KW. Gross profit £6,409, against £6,644 in 1918. Debenture and loan interest £2,615; after writing £71 off suspense account, providing £208 for income tax on undivided profits, and including £1,214 brought forward, 3 per cent. dividend is to be paid, £2,500 put to renewal reserve, and £729 carried forward. The death of two directors (Mr. D. S. Campbell and Dr. Valentine Stone) occurred during the year; Mr. D. Lackie was co-opted to fill one of the vacancies.

Northern General Transport Co., Ltd.—The company own the investments, which cost £438,706, in the Gateshead, Tynemouth and Jarrow electric tramway undertakings. During 1919 the Gateshead and Jarrow companies made distributions to their shareholders from their reserves. The amounts so received by this company have been carried to reserve. The gross traffic receipts of the motor transport undertaking again show an increase due to the larger number of vehicles in service, but costs of operation continue to rise rapidly. There has been put to sinking fund £1,260; 6 per cent. preference dividend £6,522; 10 per cent. on the ordinary shares £22,711; carried forward £14,010.

Minehead Electric Supply Co., Ltd.—Units sold during 1919 increased by 25,560. Profit on trading after payment of debenture interest £956, plus £37 brought forward. After paying preference dividend, putting £330 to depreciation and reserve, and paying 5 per cent., free of tax, on the ordinary shares, £45 is to be carried forward. The new engine and generator ordered in February, 1919, have only just commenced running. The nominal capital is to be increased to £20,000, and the existing 800 £10 preference shares are to be converted into 8,000 shares of £1 each.

Shanghai Electric Construction Co., Ltd.—Supplementing our note of last week the profit for 1919 was £154,567, compared with £71,537. The loss by exchange on subsidiary coinage in 1919 was £52,139, which is equal to 16.29 per cent. on the capital of the company. The ratio of depreciation to gross takings increased during the year, and still shows an unfavourable tendency. The traffics and net receipts for the current year continue to be satisfactory. The 15 trailers and seven railless electric cars have not yet been brought into service owing to the difficulties and delays incidental to manufacture.

Indian Electric Supply and Traction Co., Ltd.—Mr. J. G. B. Stone, presiding at the annual meeting on May 7th, said that the year had been one of great difficulty. The position had now improved. Units sold had increased in all departments, excepting for special contracts where there was a decrease due to the temporary stoppage at some of the mills owing to labour unrest. In order to provide an increased margin of safety a second-hand 500-KW. set had been secured. Very considerable developments in the business were anticipated. The tramway had been more remunerative than in the previous year; passengers carried and traffic earnings had improved, but a heavy expenditure on repairs had had to be met.

Hurst, Nelson & Co., Ltd.—Interim dividend of 1s. per share (5 per cent., free of tax).

Digitized by Google

Bastian Meter Co., Ltd.—The net profit for 1919 (after writing £1,250 off goodwill) was £976, plus £151 brought forward. The directors recommend payment of the 6 per cent. dividends on the cumulative preference shares for the two years ended December, 1919, amounting to £241, also a dividend of 3 per cent. on the ordinary shares for 1919, leaving £588 to carry forward.

West African Telegraph Co., Ltd.—Dividend of 2 per cent., making 4 per cent., free of tax, for 1919.

STOCKS AND SHARES.

TUESDAY EVENING.

THERE is every indication in the Stock Exchange markets that the public are taking a hand amongst investment stocks and shares. Business, however, still comes tamely, and it is impossible to gauge the tendency of the Stock Exchange for long at a time. Excess Profits Duty has now come to be regarded as fixed, so far as this year is concerned, at 60 per cent., and there is a disposition to wait and see how this is likely to affect industrial companies. The past success with which sellers have passed on taxes to the consumers encourages the idea that there is not likely to be much diminution in dividends, but this remains to be seen, and meanwhile the buyer of industrials treads softly. Something of a feature is the strength of rubber shares, which is somewhat surprising in view of the low price of the raw material, though explainable by reference to the fact that rubber companies are selling their produce at excellent prices for forward delivery. Consequently, rubber shareholders are content to retain their investments for future profits.

With so many causes of unsettlement in the air, the tendency is still to buy gilt-edged stocks in preference to those of the more speculative order. Therefore it comes about that quite a number of good-class preference shares, which lately have been inclined to droop, are now taking a turn for the better. There is, indeed, a public demand for anything of the sound order offering 7½ to 8½ per cent. on the money. While many of the recent comers afford the latter rate and more, the conservatism of the investor leads him to prefer the older-established concerns, and to accept a lower rate of interest from these than can be obtained from newer comers. Nevertheless, it happens occasionally, to the exasperation of the proprietor of shares in which there is not much market, that when he comes to sell he finds the nominal quotation is not the correct market value, and he is offered some lower figure than that which appears in the list. The reason is that unless shares should actually come to market, the prices are left standing until somebody wants to deal, and it is only then that the seller discovers that the 7 per cent. Bank Rate has had a greater effect upon his stock than was apparent in the price being left unaltered.

By refusing the offer of the London General Omnibus Company in regard to wages, the men have caused dulness amongst the electrical railway issues, although Underground incomes hold their price. London and Suburban Traction preference fell away to 3s. on the report just out. The Toronto Power Company invites tenders for repayment of their stock by the 4½ per cent. debenture holders, and allows until May 28th for these to be sent in. Prior to the issue of the circular, the price was standing at 57-60, and this is quoted by the company in its invitation, but now the stock has risen to 65½, and possibly might command still more. It is always difficult for a stockholder to know at what price his tender is likely to be accepted by a company in such circumstances as these.

Bromptons are ¼ down to 6⅜, bringing the yield to nearly 9½ per cent. on the money. Westminsters pay 9½ per cent. and South Londons rather more. Kensingtons have come down 5s. to 4¾, the return in their case amounting to 7½ per cent. on the money. Metropolitans afford 10 per cent. at their lowered price of 3. Considerations of yield seem to affect these electric lighting shares hardly at all: the market is dull and heavy. With coal higher, it is not likely that any illumination shares will increase in popularity. Electric Constructions are easier at 22s. English Electric ordinary stand about 22s. 6d. Yorkshire Electric Power ordinary, £4 paid, were recently negotiated at 29/16, while the 5 per cent. debenture stock, which came out at 88, last changed hands at 85½. The £35 paid scrip is about 35½. Newcastle-on-Tyne 7 per cent. preference keep very steady at 20s. 6d. Notting Hill ordinary shares can be bought on the basis of 20s. 9d.; the company's 6 per cent. preference have not been dealt in for five months in the Stock Exchange, when the last recorded bargain was at 8½.

Melbourne Electric Supply new shares, issued at 25s. and with 10s. paid, maintain 1-16 premium. Indian Electric Traction 7 per cent. convertible preference, fully paid, are at 1s. discount. Permission has just been granted to deal in the partly-paid British Electric Transformer shares, and the nominal price, 5s. paid, is "a small discount to a smaller premium." Shropshire and Staffordshire Electric Power 6 per cent. preference are quoted about 14s., the 5½ per cent. first debenture stock being 89. A small lot of Urban Electric Funded dividend certificates was sold the other day at a florin per £1. The preference remain at 27s. 6d., in spite of the dividend having just been passed.

Fairly numerous dealings occur in the new shares of the cable companies, and Westerns at 5 for the £1 paid and 13½ for the fully-paid are in some demand. Eastern Extensions are 4 7-16 £1 paid and 13⅜ fully paid. Eastern Telegraphs are 10s. 6d. for the 2s. paid and 27s. 6d. for the £1 paid, and the new Globes, £1 paid, are 4⅜ buyers. There is not much doing in the senior issues. Eastern ordinary is ¼ lower at 159½, and the others in this group show no movements. United River Plates drooped to 7⅞. West India and Panama fell to 15s. on the passing of the interim dividend. Marconis are again a poor market, the parent shares dropping back to 3⅜, and the new ordinary, issued at £3 and with 35s. paid, falling in unison to 36s. Canadian Marconis are dull at a shade above 10s., and Marines at 2⅛ have gone back slightly on the week. Anglo-Americans show no change. The 6 per cent. preferred offers good security and 7½ per cent. on the money, and the deferred yields the round 8 per cent. Telegraph Constructions at 22½ are again 20s. lower.

Most of the Mexican "securities" have gone back on account of the rebels' successes of the past few days. Brazilian Tractions eased off to 48½, but rallied to 50. The preferred at 81½ are 2 down. Bombay Electric preference at 12½ are another pound lower, the ordinary being 110. The Anglo-Argentine issues remain dull, and British Columbia Electric Rails are irregular. In the armament list, Vickers keep somewhat heavy on a good deal of provincial selling. The strength of rubber shares underwent some trifling modification as the price of the product slipped back to a florin per lb.

FURTHER REMARKS ON THE EFFICIENCY OF DOMESTIC ELECTRIC HEATING.

By G. W. STUBBINGS.

A RECENT series of articles in the ELECTRICAL REVIEW, from the pen of Mr. B. L. Klemens, has been written with the idea of demonstrating the superior over-all efficiency of the electrical method of domestic heating as compared with the use of gas. The conclusion arrived at by the writer of these articles is that the thermal efficiencies of the two processes are in the ratio of 18 to 14¾ in favour of electricity, such thermal efficiency being defined as the relation between a given number of heat units actually available for domestic use and the potential heat units contained in the coal used to produce the former number of heat units.

This conclusion is interesting, and as gratifying to electrical engineers interested in electricity supply as it seems to have been unpalatable to engineers connected with the gas industry. An examination of the arguments employed to arrive at this conclusion reveals a considerable lack of clearness, and the present writer has, therefore, gone afresh into the whole matter with the idea of setting out the problem in as concise a manner as possible. The results do not quite agree with those of Mr. Klemens, and it appears probable that sufficient justice has not been done to the claims of gas. A further examination of the case for electricity hardly makes it appear that Mr. Klemens's estimate of the efficiency of the electrical method is an unfavourable one, but rather one representing more or less ideal conditions not yet realised.

The method of domestic heating which, according to gas engineers, offers the maximum economy and advantages, is the use of certain of the products of the distillation of coal, by direct combustion, these products being gas and coke. The fact that other products have an enormous industrial value is of the highest importance, but not strictly relevant to the question of thermal efficiency. The fundamental data concerning the process of gas production, as accepted by Mr. Klemens, may be taken as follows :—

Average B.TH.U. per lb. of coal	13,000
Gas obtained per ton of coal destroyed ...	15,000 cb. ft.
Average B TH.U. per cb. ft. of gas	480
Coke obtained per ton of coal destroyed ...	8 cwt.
Coke used for the destruction of 1 ton of coal	4 „
Net yield of coke per ton of coal destroyed	4 „
Average B.TH U. per lb. of coke	11,000

From these data the efficiency of transformation from coal to gas can easily be obtained. Taking as a basis 1 ton of coal :—

B.TH.U. contained in coal	2,240 × 13,000 =	29,120,000
„ in resultant gas	15,000 × 480 =	7,200,000
„ „ „ coke	448 × 11,000 =	4,928,000
Total B.TH.U. in products of destruction of 1 ton of coal ...		12,128 000
Efficiency of conversion, 12·13 × 100/29·12 ...		= 41·5 %

The next factor to be considered is the efficiency of utilisation of the actual heat in the gas and coke by the consumer, and the data which have been furnished by the gas authorities, and accepted by Mr. Klemens, are as follows :—

Gas used in cooker and boiling-rings in equal quantities :
Efficiency of cooker, 13·6 %.
Efficiency of rings, 50 %.
Overall efficiency of utilisation of gas = ½ (50 + 13·6) = 31·8 %.
Efficiency of coke boiler, 60 %.

Considering again the products of destruction of one ton of coal, these are used as follows :—

4 cwt. of coke, containing 1·93 × 10^6 heat units at 60% efficiency.
15,000 cb. ft. of gas, containing 7·2 × 10^6 heat units at 31·8 % efficiency.
Over-all efficiency of utilisation = (7·2 × 31·8 + 4·93 × 60)/(7·2 + 4·93) = 43·0 %.

A figure of 41·5 per cent. is then arrived at as the efficiency of conversion of coal into coke and gas, and a figure of 43 per cent. as the efficiency of utilisation of the available heat content of these two products. Mr. Klemens, in one of his articles, apparently doubts the possibility of using the whole of this coke. This objection, however it may apply to purely domestic uses, ignores the many other possible uses of coke. One obvious use is for combustion under steam boilers for power-raising purposes, in which circumstances, it must be remembered, an efficiency of utilisation in the neighbourhood of 80 per cent. is quite practicable. It seems, therefore, that to accept an average figure of 60 per cent. for the efficiency of utilisation of the heat content of coke is not unjustifiable.

Using the two efficiencies arrived at, the over-all thermal efficiency of the gas method of heating is given by their product, and this efficiency is accordingly 0·43 × 0·415, or 17·8 per cent. This figure is appreciably better than that of 14·66 per cent. deduced by Mr. Klemens, and is practically the same as that taken by him to represent the over-all efficiency of the electrical method.

This latter figure of 18 per cent. requires examination. It is based on a 20 per cent. efficiency of conversion of the potential heat units of coal into electrical energy, and an efficiency of utilisation of this electrical energy of 90 per cent. With the latter figure few will quarrel seriously, although it may, perhaps, be taken to represent fair average, and not unfavourable, conditions. It must also be remembered that an efficiency of 90 per cent. will not apply to boiling appliances of the hot-plate type. The figure of 20 per cent. efficiency of generation of electrical energy, given by the gas authorities as the maximum possible with the most up-to-date plant and under most favourable conditions, is tacitly assumed by Mr. Klemens to be a low estimate of the actual efficiency obtainable under normal average conditions. It will, therefore, be interesting to see exactly what is meant by a 20 per cent. efficiency of conversion. This inquiry may conveniently be set out as follows :—

1 KW.-hour = 3,411 B.TH.U.

To produce 1 KW.-hour at consumer's service requires 3,411/20 % = 17,055 B.TH.U. at the works.
Average B.TH.U. per lb. of coal used for electricity supply, 11,000.
Lb. of coal containing 17,055 B.TH.U. = 17,055/11,000 = 1·55.
Lb. of coal per unit sold = 1·55.
Assuming 80 % of units generated reach consumers' terminals.
Lb. of coal per unit generated = 1·55 × 0·8 = 1·24.

A figure of 1·24 lb. of coal per unit generated can hardly be considered an unfavourable estimate from the point of view of electricity, and will perhaps for some considerable time only be possible with a high load factor. The probable load factor of an electric heating load would not appear to be high. But this would depend largely upon the popularity of electricity for heating purposes.

It may be interesting to assume an average good figure obtainable in present-day circumstances, and to see what over-all efficiency this leads to. The assumption of 2½ lb. of coal per unit generated will not be on the high side for the average undertaking, taken over an extended period, and assuming as before an efficiency of distribution, &c., of 80 per cent., this will correspond to 2·5/0·8 or 3·12 lb. of coal per unit sold. We then have—

1 KW.-hour = 3,411 B.TH.U.
Coal required to produce 1 KW.-hour = 3·12.
Average B.TH.U. per lb. of coal = 11,000.
Total heat units required to produce 1 KW.-hour = 3·12 × 11,000 = 34,320.
Efficiency of conversion = 3,411/34,320 = 10 % nearly.

It does not, therefore, seem unreasonable to conclude that from the standpoint of thermal efficiency, the gas authorities can offer a more economical system of domestic heating than can the electricity supply undertakings at the present time.

The most promising application of electricity for cooking purposes is to be found in the electric oven, possessing as it does the advantages of cleanliness and convenience, together with that of turning out better cooked food with a markedly less decrease in weight, than the gas oven can ever hope to do. These advantages should be sufficiently weighty to overcome any disability in point of thermal efficiency, but it will not be a waste of time to compare on this basis the

Digitized by Google

gas with the electric oven. We have, then, considering the gas oven :—

Average efficiency of conversion of coal to gas and coke = 41·5 %.
Efficiency of utilisation of gas in oven, 13·6 %.
Overall thermal efficiency of gas oven = 13·6 % × 41·5 % = 5·65 %.

For the electric oven, on a present-day basis of 2½ lb. of coal per unit generated:—

Efficiency of conversion of coal to electrical energy = 10·0 %
Efficiency of utilisation ... ... 90·0 %
Over-all thermal efficiency of electric oven = 90 % × 10 % = 9 %

proving that from the standpoint of over-all efficiency, the electric oven is eminently superior to the gas oven.

The above figures relate to ultimate thermal efficiencies, and would show that although the use of the electrical oven gives superior results to those of gas, the combined efficiency of the whole of the domestic heating processes, including the provision of hot water, is more favourable with gas than with electricity. The fact that the use of electricity for heating purposes is making such rapid strides in no wise contradicts this conclusion, but simply indicates that ultimate thermal efficiency is not the only factor which fixes the value of any system of heating in the judgment of the actual user. A factor of far greater interest to the actual user is that of cost of operation, since it does not necessarily follow that a given amount of useful heat will cost the same whether produced by the combustion of gas or by electrical means. It may, therefore, be of interest to work out the comparative figures for the cases of a gas and an electric oven, taking for this purpose a basis of 3d. per unit for electricity, and 5s. per 1,000 cb. ft. for gas. We have, then :—

Cost of electricity per KW.-hour	... 3d.
B.TH.U. actually obtainable ...	... 3,411
Efficiency of utilisation in oven	... 90 %
Useful B.TH.U. per unit.	= 3,411 × 0·9 = 3,070
Useful B.TH.U. per penny	= 3,070/3 = 1,023
Cost of gas per 1,000 cb. ft. ...	... 5s.
B.TH.U. per cb. ft.	... 480
B.TH.U. obtainable per 1,000 cb. ft.	... 480,000
Efficiency of utilisation ...	... 13·6 %
Useful B.TH.U. per cb. ft.	= 480,000 × 0·136
Useful B.TH.U. per penny	= 480,000 × 0·136/60 = 1,088

On the basis assumed, which does not unduly favour electricity, gas and electricity are about equally advantageous as regards cost of operation.

It therefore seems clear that, as regards cost of operation, electricity will usually be more expensive than gas. But, again, it must be remembered that, however important cost of operation may be in industrial matters, it is not a factor of paramount importance in domestic life. If, for instance, means are required for boiling kettles of water in the scullery of a house, the use of a gas ring is rational, but if the same process is to be carried out in the dining room, the inferior ultimate thermal efficiency of the electric kettle will not stand in the way of its adoption, owing to the fact that on the score of cleanliness, convenience, and general desirability, it is the only possible device. It seems, therefore, that electrical men can be quite content with the manifold advantages of the apparatus they can place before the householder—which advantages are quite weighty enough to secure its introduction into a rapidly increasing number of homes—without claiming for such apparatus a thermal efficiency it does not really possess. The inherent thermal inefficiency of the process of the conversion of the potential energy of coal into the mechanical energy necessary to drive electrical machinery seems to preclude the possibility of electricity ever being the most economical method of producing domestic heat. Considerations of ultimate thermal efficiency are, however, of minor importance in a very large number of homes—comfort, cleanliness, and convenience being accounted of sufficient moment to ensure that electricity for heating purposes will find a rapidly increasing use.

Report on German Industrial Conditions.—Mr. Bonar Law states that a report of industrial and commercial conditions in Germany at the close of the year 1919 will shortly be published. Commercial Commissioners who are stationed at Berlin and Cologne will report periodically on the conditions in Germany.

FAILURES OF TURBO-GENERATORS AND SUGGESTIONS FOR IMPROVEMENTS.

At a meeting of the North Midland Centre of the Institution of Electrical Engineers, at Leeds on March 9th, Mr. J. Shepherd read his paper on the above subject, an abstract of which appeared in the Electrical Review of January 16th. The chairman of the Centre presided, and expressed the pleasure of the members at seeing Mr. Shepherd once more amongst them.

Opening the discussion, the Chairman said the trend of advance in any class of machinery was always at a very rapid rate of change. Mr. Shepherd was the first engineer who had had the courage to come forward and point out the absolute necessity now of considering the great step in advance. The difficulties of obtaining clean air had been very much brought to the front, and some of the members who were present some time ago would remember Mr. Helford's account of what happened to one of the Leeds machines that was nominally clean but really dirty. Mr. Shepherd had boldly brought forward the proposition that the whole machine should be one large water jacket, and Messrs. Parsons, who were always pioneers, had definitely produced a water-cooled rotor. Mr. Shepherd went a long way in advance of that. He recognised that they must tackle the vexed problem of the end turns. The great merit of his solution was that in introducing those new appliances he at the same time tried to adopt and improve on any of the old refinements in the way of supporting coils which had been found so necessary in improving the earlier types of machines. In fact, he attempted to go a great deal further in supporting coils than had been done yet. They could certainly record their appreciation of the courage and foresight which Mr. Shepherd had shown in writing his paper.

Mr. Johnson Wright said that stators had given them a rough time during the past thirteen years, and he (Mr. Wright) had had experience of many of the break-downs referred to. In the early days a great deal of the trouble on the stators was due to a loose core. He agreed with Mr. Shepherd that many of the soft cores were due to insufficient supports in the teeth. He could remember where the supports only consisted of one-sixteenth steel dead edge up against the lamination. The steel yielded and the teeth vibrated, and after a short time they broke and the machine was wrecked. Some of Mr. Shepherd's ideas for overcoming the trouble with rotors were original. The weak point was the end curve. Phosphor bronze had been shown to be absolutely unreliable, because they could not calculate—no matter how many test pieces they had—the strength of the material. The casting might look all right, but when the machine was put up it might be found all wrong inside. Mr. Shepherd had referred in his paper to steel bands, and these were the solution of the matter. The speaker favoured either a nickel chrome or a phosphor bronze cap. With the one with steel strip or phosphor bronze wire they had all the advantages of the metal as support and also the strength, because they could calculate the strength of a steel strip or phosphor bronze wire, whereas they could not ascertain the strength of a casting. With regard to rotors, there was a point always to be avoided in the design, to which Mr. Shepherd had not referred. It had been the practice a few years ago to make the rotor end conical in form, and the cap also conical in form. The idea was that the cap secured the winding. That was an excellent idea, but in the case he had in mind it was found that the tremendous end throws set up the centrifugal forces acting on the plane, with the result that a two-inch key was easily sheared off. Mr. Shepherd had shown on the screen photographs of machines made by Messrs. Parsons. He, personally, did not think that enough credit had been given to Messrs. Parsons for the development of the water-cooled rotor. It was a sound mechanical device, and the rotors ran remarkably well. As to the figure in which Mr. Shepherd showed a diagram of the stator on the water cooling principle, he did not much care for the idea of making an outlet at the coupling. It seemed to him it would be impossible to make a watertight running joint so that they could keep the water out of the alternator. Apart from finding room for the air ducts required in ships—with large machines up to 20,000 KW., it was a hard enough job to find room for the air ducts in a station. As far as ship propulsion was concerned, it seemed to him that water cooling had got to come sometime or another.

Mr. Brown said it did not matter whether they were dealing with 50,000-KW. or 5,000-KW. machines—there was the question of insulation. He supposed 95 per cent of the breakdowns in electrical machinery, particularly in some small-sized machines, were first of all connected with the failure of insulation. A few occasionally were due to mechanical weaknesses, but there was no question about it that what they needed to make a satisfactory machine was better insulation. The insulations which Mr. Shepherd had pointed out to them in those large machines were almost of necessity built up with mica in some form or other, but at the same time it was difficult to put mica in some machines. By

Digitized by Google

reason of that one had to fall back on the ordinary cotton covering. It did not seem to matter much what sort of varnish they used or what method they adopted in the winding of the coils, it was not long, if the machine was allowed to get dusty or dirty, before they got insulation troubles. The point which the author had put before them with regard to the water-cooled machine, although it dealt largely with the larger machines, and the difficulty of obtaining clean air, seemed to point to him that there would be an opportunity even with medium sized machines, particularly where they were working in very awkward and dry and dusty situations. Quite a number of such places existed in the country, and if only a satisfactory method of water cooling could be adopted he was sure it would meet with a great deal of success. If better methods could be adopted for keeping down temperature, the machines could be run at a very much larger output than the normal rate. It had been mentioned that it was impossible almost to find out whether faults existed in phosphor bronze castings or not, but with X-rays inspection apparatus they could now pierce through five or six inches of metal, and he hoped that in due course they would be able to examine a casting to a very much greater extent than they could at present. The whole paper seemed to show what troubles there were even to-day with insulation, and he could only hope that Mr. Shepherd's paper would be the means of lessening a great many of their existing troubles in that direction.

Mr. Thorpe (Leeds) said that he would be interested to know whether Mr. Shepherd had considered the destructive effect of suddenly generating steam in the event of a heavy "short" producing local heat in the neighbourhood of the water-cooled elements. He (Mr. Thorpe) had had a good deal to do with the development of new ideas other than in electrical lines, and he knew the difficulties which had to be encountered by those who endeavoured to bridge the gap between the manufacturer and the user, and it was very satisfactory to come across a paper of this type.

In his reply, Mr. Shepherd said that the problem of cooling had only arisen within the last few years, and since the high speed machines first began to be introduced. Ever since 1879 designer after designer with one exception had constructed machines up to the present time relying on the imperfect way of cooling by blowing air through them. Now they had got to the size when the amount of heat to be got rid of approached that of a small condenser. When they got a "short" on a machine with a collective power behind it, at large stations he did not think any insulation supported in any other way than shown on the slides, that was by clamps here and there, would ever hold the coils adequately against those enormous forces. The time was coming when with high speed machines they would have to have stresses greater still. This would force them to introduce water-cooling or oil cooling, and when that had been done then they could face the redesigning of the supports something after the fashion which he had indicated. He was glad that Mr. Johnson Wright agreed that the safest band for supporting the rotor bindings was the high tensile steel one. Steel flexible bands and tape and wire had been used in the past, and had proved failures in a good many cases. Bands had failed for two reasons. They were put upon coils at a fairly high tension, and there was nothing to prevent a coil sinking under the pressure of the bands upon them. And, secondly, there was nothing to support the band except the coils, whereas if one had a device as shown on the rotor in fig. 9, there was an adequate way of centring and supporting a band quite irrespective of the coils under it, and with drawn steel wire tape they were dealing with the strongest and most reliable material known, because in its manufacture it was subject to stresses as high or higher than any which would be experienced in working. It had been suggested that he had hardly given sufficient credit to Messrs. Parsons. He would, however, remind them that on page 9 of his paper he had stated: "Various designs have been proposed using liquid cooling. Whilst the majority of them are of foreign origin the initial adoption of water cooling to modern machines is to be credited to Messrs. C. A. Parsons & Co., Ltd." He, Mr. Shepherd, would have said more when he wrote the paper if he had known, as he now knew, that Messrs. Parsons had made so many of their machines with water-cooled rotors, but it was not until he read his paper at Newcastle that he had the first opportunity of seeing their water-cooled machine. With regard to the criticism of the device shown in fig. 13, that that was merely a diagram of the discharge of the water at the coupling, and had certain objections, he quite agreed. That was only one way of getting rid of the water. Another way was to drill the rotor shaft and discharge the water at the low pressure end of the turbine. With regard to the size of cooling ducts with large machines, those were immense and of deep proportion. He did not see how with the usual amount of engine-room space one could find room for those ducts. In the paper he had given some figures of representative ships with the sizes of the cooling ducts necessary for air cooling, and in working out those sizes he had allotted a high air velocity of 2,000 ft. per minute. If they took that extreme example of modern engineering, the battle cruiser of 180,000 H.P., the diameter of the air duct for both the generators and the motors was 19.6 ft. in diameter. He supposed most of them had been on board a modern battleship, and had seen how the machinery was cramped together. In a very small space they would cram in something like 12,000 H.P. Of course, such condensation of power was only possible when oil fuel was employed. In such cases, to get in large air ducts became impossible. In answer to Mr. Brown, he would say that mica was certainly the best insulation provided it was applied correctly. An incidental advantage of water cooling was that they kept dust from the machine, and the presence of dust was a fairly frequent cause of surface leakage and breakdown. Mr. Thorpe had helped him very considerably in developing the idea of water cooling, so much so that it was difficult to say which were his opinions and which Mr. Thorpe's. He was much indebted to the latter for his suggestions. The question whether one should employ water or oil for cooling had been raised by various people. The advantage of water was that they could easily get it, and that its specific heat was about double. Therefore they had the maximum cooling effect with water over that of oil. If they were going to have leakage the question was, which would do least harm, water or oil? He should not recommend any method of construction in which there was any possibility of leakage, and with modern methods of construction one could construct devices in which there was little or no risk of leakage. There was, however, the possibility of a breakdown and subsequent leakage. In such a case, before they got right down to the core, he thought there would be no doubt but that the protective relays of the system would have operated, and the arc causing the burn out would have disappeared before it got within reach of oil or water. He would rather have water leaking into the machine putting the fire out round the insulation, than oil. The particular water device would be cut off. Hot water could be circulated round the remainder, and the machine could very rapidly be dried out, and unless the burn out was a very serious one the machine could be on load again very quickly. He did not think there would be any danger of any destructive effect as raised by Mr. Thorpe unless the relays hung up and the steam was discharged into a very active arc when there would be destruction. Generally they would have that destruction whether they had oil or water, but he could not contemplate on a big system a total failure of protective relays so that they would have water playing into an active arc.

A hearty vote of thanks was accorded to Mr. Shepherd for his paper.

ELECTRICAL PRECIPITATORS IN JAPAN.

A number of electrical precipitators have been installed in Japanese smelters since 1918 by the Metallurgical Research Institute, which owns the Japanese rights of the Cottrell process. The installations, according to *Chemical and Metallurgical Engineering*, are all similar, consisting of from one half to ten repeated sections, each containing 64 pipes, 12 in. in diameter and 16 ft. long. Ordinarily one motor generator serves two sections, each set comprising a 15-H.P., 50-cycle, 500-volt, 3-phase motor, a 10-K.V.A., 50-cycle, 200-volt generator, and a 10 or 15-K.V.A. transformer capable of giving 100,000 volts on the secondary.

At the Ashio smelter, Furukawa Mining Co., two treaters were installed in 1918; one to treat the mixed gases from four McDougall roasters, two copper blast furnaces, and four converters; and the other to treat the gases from a reverberatory furnace after having passed through waste-heat boilers.

The gases are drawn through the main treater and discharged directly from the fan casings, while those of the reverberatory furnace are drawn through the reverberatory treater by the natural draught of the stack. As the revergeratory furnace is not operating continuously at present, the gases and those of eleven pot roasters, four blast furnaces and four copper converters are mixed and treated entirely by the main treater. Thus the gas volume now handled by the main treater seems somewhat in excess of 150,000 cu. ft. per min., as designed. The amount of dust collected varies from six to ten long tons per 24 hr. The efficiency of precipitation seems to depend upon the nature of the furnace charge and the moisture and temperature of the gases treated. When the conditions are very favourable, it runs as high as 98 per cent., passing a white smoke, but sometimes it drops to about 70 per cent., when the smoke acquires a yellow tint. When the conditions are such that the charging voltage can be raised above 80,000 volts with a comparatively small increase of the current, precipitation is very satisfactory.

Several years ago a large dust chamber was installed, using the Roesing wire system. The gases passed from this chamber to four large stacks, in which they were diluted by the forced admission of fresh air, before being discharged into the atmosphere. The main treater was installed at the side of this dust chamber, so the gases pass through the dust chamber before going through the treater. The numerous suspended wires in the dust chamber were removed, so that only the heavier dust, which is of more value because of its higher

Digitized by Google

percentage of metals, would be caught in the chamber and all the lighter dust which cannot be efficiently collected by gravity settling would be caught in the Cottrell treater.

The precipitated dust contains rather large quantities of the oxides of arsenic. These oxides are extracted by subliming the dust in a small reverberatory furnace, and the cinders resulting, which are quite rich in copper, are sent back to the pot roasters after being briquetted.

At the Kamioka smelter, Mitsui Mining Co., the gases passing through the treater come from the following furnaces: Three lead-smelting blast furnaces, two liquation furnaces, five softening furnaces, and all the lead-refining furnaces and kettles. The Kamioka smelter is located in the heart of the sericulture district, and the residents in the vicinity strenuously objected and demanded heavy indemnities, claiming that the smelter smoke damaged the mulberry leaves and killed the silkworms. Therefore, every effort was made to complete and start the Cottrell plant at an early date. About 1 to 1½ tons of dust are collected per day in a three-section treater.

At the Naoshima smelter, Mitsubishi Mining Co., the erection of a smelter was permitted by the Government on the condition that the smelter gases would be cleaned by the Cottrell process. The operation of the treaters was, therefore, begun when the smelter started up in March, 1919. It was designed for a capacity of 80,000 cu. ft. per min., assuming a velocity through the pipes of 5 ft. per sec. The lead-bearing fumes from the lead-smelting furnaces and the fumes from the McDougall roasters and converters of the copper smelter are mixed, and are both treated by the precipitator. Natural draught is furnished by a stack 150 ft. high and 10 ft. inside diameter.

The smelter being only recently started, the furnaces are not yet running at their full capacity and the gas volume handled runs from 40,000 to 45,000 cu. ft. per min. Visual clearance by an S-section plant is practically perfect. The dust collected every 24 hours amounts to about 1.5 tons.

The treater at the Ikuno smelter, Mitsubishi Mining Co., handles the gases from two blast furnaces smelting copper ores. After passing through an old dust chamber, the gases are drawn through the treater by an exhaust fan and are discharged from the old stack. At the first trial the treater showed good efficiency, but this lasted only a couple of days and then the operation became so unsatisfactory that the diminution of smoke could scarcely be recognised even when the treater was charged at a high potential. After experimenting in various ways, it was decided to humidify the gases, a practice which was found necessary for satisfactory precipitation in several American plant. A dozen orchard spray nozzles of 1-16-in. diameter arranged in the dust chamber using water at 120 lb. pressure per sq. in. injected a fine spray into the gases before they entered the treater. Thus precipitation was conspicuously improved and the efficiency raised to about 95 per cent., and at the same time the operator can raise the charging voltage to 80,000 volts while the current is only 30 amp. When, in order to examine the effect upon precipitation, the water sprays are turned off, the charging potential drops and the current increases so that the clearance becomes as low as 50 per cent.

The amount of dust precipitated per 24 hours is about 0.6 ton.

At the Nikko electrolytic copper refinery, Furukawa Mining Co., the gases from two cupellation and two reduction furnaces are treated to recover silver-bearing lead dust. The treater consists of one section of 32 pipes arranged in a rectangle. The treater was started in May, 1919.

The amount of the precipitate is about 100 lb. per 24 hours. The power consumption is comparatively high, being from 2.5 to 5 KW.

TRANSFORMERS FOR ELECTRIC FURNACES.

On March 23rd before the North Midland Centre of the Institution of Electrical Engineers, at Sheffield, Mr. J. Lindley Thompson, M.Sc., read his paper on "Transformers for Electric Furnaces," an abstract of which appeared in our issue of January 30th, 1920.

Mr. W. M. Selvey, who presided, said that there was no subject in which Sheffield had more right to take an interest than that of electric furnaces. Sheffield had by far the greatest percentage of furnaces in the kingdom, and Mr. Thompson had been actively concerned with the design of many transformers, not a few of which had been applied to furnaces in Sheffield.

Mr. Yerbury (Sheffield) thought the troubles with their transformers had been very largely attributable to their having to work on two-phase furnaces. He asked the author what conclusion his company came to regarding their investigation into the suggestion that certain transformer failures in Sheffield were attributable to resonance. Also what size of transformer should be the maximum, having regard to the heating effect, &c., on very large sizes. The recommendations on page 11 of the paper were excellent, and would doubtless be followed by those responsible for installing furnaces.

Mr. Hinings remarked that he was interested in the Berry furnace transformer, which was a circular-shell type, having a centre core upon which the windings were wound. It would have been interesting to members if the author had explained that and other unique designs which had been referred to. His (Mr. Hinings) firm had turned out a large number of transformers of the Berry type during the war. In fig. 1 of Mr. Thompson's paper, he noticed that the interleaving of the low-tension bars was carried right through to the furnace, so that actual contact could only be made on one side of the busbars. He suggested that it was better to bring that interleaving to just outside the top of the transformer tank, and then separate the polarities and connect the busbars to them. By that means contact on both sides of the busbars was obtained. The connection shown in fig. 1 appeared to be rather long compared with the width. If it was drawn to scale it measured 2 ft. 8 in. by 8 in., and required the use of a spring on each bolt for clamping. He would like Mr. Thompson to tell them if the bottom right-hand bolt in the side view of fig. 1 had to be phosphor bronze, or did he use steel? It seemed to him that that particular bolt came within a field which might cause trouble. He was interested to hear of Mr. Thompson's patent, but on looking up his firm's records he learned that the half-turn design was used by his company in the early part of the century, although it was not patented. They had had transformers of the half-turn design working quite satisfactorily during the last fifteen years. On page 2 of his paper Mr. Thompson made a great point of having the tappings in the middle of the winding. He (Mr. Hinings) contended that they were still liable to very high stresses, and required also to be reinforced. As far as the transformers were concerned, he could see no limit to the size, but it was a question whether the supply authorities could deal with the large loads of such an intermittent nature. Mr. Thompson had talked about 8,000 KW. furnaces. He wondered how many supply authorities could deal with them, especially if they were installed a long way from the generating station.

Mr. Redmayne said that the steel manufacturer found that by taking one and a half full load he could melt steel quicker. He did it, and the effect upon the transformer was harmful.

Mr. Walker said Mr. Thompson did not make any remarks on the type of switch gear, though that was an important item in furnace installation. In many cases they found the switch continually tripping, due to the time limit fuses blowing. He had often found the time limit fuse holder was discarded, and he had come across cases where a piece of No. 22 copper wire was wrapped round and round the contact clip. In one case of a bad breakdown which he thought was brought about by there being four strands of No. 22 copper wire across a time limit fuse, it blew the switch tank off, and played havoc with the transformer plant in general. He believed that the supply authorities in Sheffield had recommended that each switch should be opened out at least every month. Whilst once a month would do in ordinary cases, he personally thought that once a week or fortnight at least the oil tank should be lowered to note if the oil needed changing. In a month the oil was badly carbonised, at least it was so when the war was at its highest, and the transformers were worked hard. As to the transformers, could Mr. Thompson give them any idea as to how often he would consider a transformer winding should be lifted for examination?

Mr. Thompson, replying, said the troubles referred to were only in one case due to the transformer itself, through inefficient drawing out. All other troubles were traceable to faulty switch gear, bad lay-out of furnace connections, or to dampness in the sub-station, &c. On one transformer he remembered the high tension pressure flashed over from the high-tension lead to the low-pressure lead, a distance of something like 6 to 9 in. In that same sub-station another transformer flashed over in a similar manner—he thought it was due to moisture coming in through the roof of the station and causing the flash over. As to the maximum size of transformer which Mr. Yerbury inquired about, he did not think there was a maximum size. They could build up to any size of transformer within loading limits. There was no trouble in building transformers up to 50,000 K.V.A. The size of the transformer was limited by the size of the furnaces that could be made and used commercially. As to the 8,000 K.V.A. suggested, he would advocate that it be put in three units so as to facilitate handling and accommodation. The Berry transformer had certainly been used a great deal, and was in use with furnaces. Shell-type transformers were described in the paper, and he thought the same remarks applied to the Berry as to the shell types there described. As to the interleaving described by Mr. Hinings, he thought that would be for a transformer of somewhere about 500 K.V.A., and would be for transformers located directly under the furnace or close to it. He considered if they were to take a furnace transformer of 2,000 K.V.A. capacity and try to run it with a single set of positive and negative leads they would have no voltage across their furnaces when they got to the other end of the leads. With regard to the bolts shown in fig. 1, they made them of steel. The clamp plates of the clamps were made of phosphor bronze so that they had no magnetic circuit round the conductor. He did not think he had seen any transformer with a half turn other

Digitized by Google

than that in which the half turn was taken out as a tapping and used as a starter with rotors. He knew several Berry transformers which had a half turn, but it was not on balance. It was out of balance, the catch got hot if it was run on that type. The patent covered all the plugs, &c. The suggestion that the tapping should be in the middle of the winding was not for the purpose of reducing the possible voltage pressure on the winding, but for reducing the voltage across the winding, and that led the voltage to the wires in connection with the winding. If the tappings were on the winding when they were working at the minimum high pressure the voltage across the whole of the wiring was in ratio. If they had an 11,000-volt transformer on low pressure of 75, 76, and 85, when they were working on the 85 tapping the voltage across the high-tension wires of that tapping was approximately 16,000. He agreed that the tappings, wherever they were, should be reinforced. The size of transformer would depend on the supply company's mains. If it was at a moderate pressure it would have to be almost directly on the station or adjacent to the station. He did not think there would be much trouble about bulk supply from large systems. In connection with the question of the currents, he found that on practically all the installations there was only one ammeter on the primary side of a three-phase set, which was very misleading, especially with a Scott-connected transformer group which might be taking 50 per cent. overload. In connection with two-phase furnaces, when the hearth was not conducting one transformer could easily be loaded to 50 per cent. above its normal value, whilst the meter on any one phase might only read normal. He had known cases where transformers had been running in that condition many days before anyone found it out so far as the load was concerned. It was a necessary condition in the case of two-phase furnaces in order to dry out the bed of the furnace when first putting it in. With regard to regulators, &c., there were one or two installations in the country where regulating transformers were used in preference to tappings. He did not know why they had not been more used, unless it was the question of cost and perhaps floor space. The question of switch gear had not been touched on in the paper since it was entirely in connection with the transformer, and the connections between the transformer and furnace that he was interested in, and could give most information upon. The oil ought to be examined at least once in six months if the transformer was run at anything like a reasonable percentage. The transformer should be lifted if the oil showed any sludge. The suggestion of having recording meters on the panels of the furnace transformer gear was quite a good one. In fact he thought they ought to be just as much used as with the steam supply. In several cases he knew of they had installed recording ammeters. He thought that the only reason they were not used more was because of the question of cost, and possibly the trouble of changing and re-changing the records.

A vote of thanks was accorded to Mr. Thompson for his very interesting paper.

HIGHLAND WATER-POWER.

On April 13th, 1920, Mr. J. M. M. Munro, M.I.E.E., A.M.I.C.E., gave an interesting lecture before the Scottish Centre of the Institution of Electrical Engineers, at Glasgow.

The lecture dealt with the nature, need, and urgency of a preliminary investigation of the entire field of national potable and power water supply, and the organisation necessary to undertake it.

The problem was fully to utilise and equably to distribute the whole water resources of the country for the maximum benefit of all. In the highlands of Scotland, where special conditions prevailed, the permanent interests of the local highland people must not be overlooked. Water power and improved transport were the keys of the only door separating the highlands from a fair share of national prosperity. If that door were not opened, the Highlands might become a second Ireland. Its people would not for ever consent to live upon a few sheep and the gratuities of sportsmen.

The preliminary inclusive general survey could most quickly be accomplished under the auspices of interim district Water Committees appointed by groups of County Councils.

Schemes ripe for accomplishment could be undertaken by permanent Area Water Boards. These boards would be semi-public local water authorities trading under statutory powers. A Government contribution towards cost would probably be necessary, but the main capital would be borrowed through local authorities and others demanding or reserving water or power supply. These boards would not distribute beyond their area, but would sell water there to local authorities, and electrical energy to the electricity district authorities. It was suggested that water rights be vested in County Councils empowered to collect from water boards a small taxation rate on water taken from their county. The object was a relief of oppressive rating in thinly populated counties.

Water schemes now outlined would be profoundly modified by detailed study of their areas. Insufficient preliminary information was available regarding localised rainfall on high and even on low levels, on seasonal and daily rates of outflow, on stream contour levels, on water storage possibilities, and on all the long series of items requisite for reliable planning and approximate costing of national water possibilities.

The extent and approximate value of lands to be eventually submerged, fishery rights, water power rights, amenities and numerous allied matters needed investigation and possibly parliamentary action before any proposition was approved. A complete national scheme must precede any area scheme.

The lecture closed with a short review of the possibilities of trade development in the Highlands as incidental to the general utilisation of the national water power resources for the national benefit.

ELECTRIC WATER HEATERS.

Where oil is fired under a boiler it is necessary to have steam to operate the oil pump and burner before the latter can be lighted. This necessitates firing with other fuel for a period before the main boilers are started in order to generate the auxiliary steam required. In order to save this fuel and to obviate the necessity of paying the fireman overtime, a Portland, Ore., U.S.A., manufacturer has, according to a writer in the *Electrical World*, introduced into his works two 10-kw. induction electric water heaters to generate sufficient steam to operate the oil pump and burner. These heaters are brought into operation by means of a time switch, and the pressure is controlled by a contact-making pressure gauge which is set to cut in the heaters at 60 lb., and to cut them out at 80 lb. pressure. The essential features of this installation, by means of which steam is made available when the factory commences work, are shown in fig. 1, in which A is

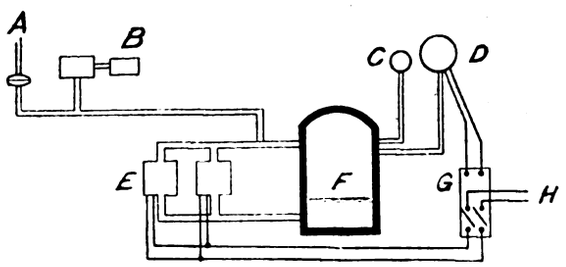

Fig. 1.—Electric Steam Generator.

the pipe line to the boiler; B the oil pump; C the indicating pressure gauge; D the contact-making pressure gauge to maintain the steam pressure within the limits stated above; E the induction water heaters; F the 50-gallon asbestos-lagged water tank; G the time switch; and H the 240-volt A.C. supply mains. It takes about one hour in the morning to obtain a steam pressure of 80 lb., and about 20 kw. hr. is consumed. The installation has been in use for over a year, and is giving every satisfaction.

There are a number of industrial undertakings in different countries which have isolated hydro-electric stations, and surplus electric power is ordinarily available under such conditions. If the electrical generating plant were operated at full capacity and the surplus power used, the revenue obtained therefrom would be practically 100 per cent. profit. For industrial purposes many undertakings require hot water or steam. If the surplus electric power mentioned above could be employed to heat the water, the cost of the fuel saved, less the capital and depreciation charges on the heater, would represent a net decrease in operating expenses. An electric water heater can be utilised either to heat water for direct use, or as a "temperature booster" in the boiler feed-water line between the usual feed-water heater and the boilers.

A very simple, rugged, and inexpensive electric water heater, built of ordinary standard wrought-iron pipe, for use under the circumstances outlined above, was described in a recent issue of the *General Electric Review*. The heater consists of a length of iron pipe, through which the water to be heated flows, and through the wall of which an electric current is passed, thus generating the heat.

A heater designed to absorb 1,000 kw. is shown in plan and elevation in fig. 2, while fig. 3 is a diagrammatic sketch of the complete system of water and electrical connections. The heater consists of three sections, in multiple so far as the hydraulic connections are concerned. Each section is built up of 10 lengths of 1.5-in. wrought-iron pipe, eight standard return bends, and one special return bend arranged to be

Digitized by Google

connected to the busbars. The three sections are mounted side by side on asbestos lumber or other insulating supports, and are connected to the inlet and outlet headers E and D. All joints between the heater pipes and bends or headers, in addition to having standard pipe threads, are arc welded to prevent water leakage, and provide good electrical contact. The heater is enclosed in a chamber, the walls of which are built up of heat-insulating brick, with a cover that is easily removable for inspection. The dimensions of the complete heater are relatively small, and it may be connected, as shown in fig. 3, in an existing water system to "boost" the temperature with almost no disturbance to the system, the only changes required being the insertion of two pipe T's and the valve A. The inlet and outlet pipes, I and O, of the heater

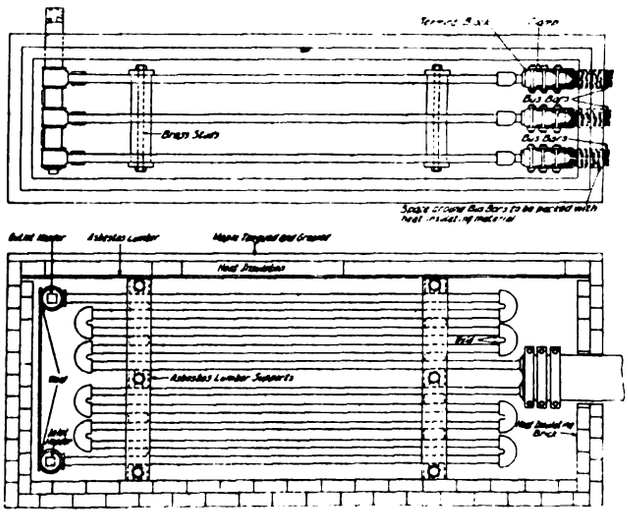

FIG. 2.—A 1,000-KW. IRON-PIPE ELECTRIC WATER HEATER.

are connected one to each of the T's, and have a valve in each pipe for cutting the heater out of the system. When the heater is in use valves B and C are open, and valve A is either wholly or partially closed, depending on the volume of water flowing through the main. Circulation is assisted by the cold water entering at the bottom and the hot water leaving at the top

An indicating flow meter is connected at I in the inlet pipe and determines the correct opening of the valve A to give the desired water flow through the heater. The instrument may be made to trip the oil switch when the water flow falls to a predetermined minimum value, or, when the heater is used

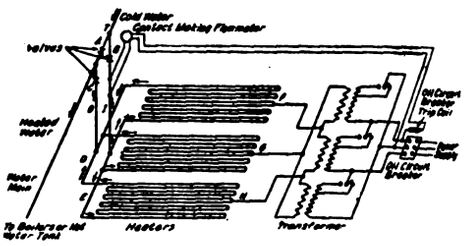

FIG. 3.—HYDRAULIC AND ELECTRICAL CONNECTIONS OF HEATER.

intermittently, to close the switch when the flow exceeds the minimum safe value. Thus the operation of the heater can be made automatic. From the electrical line terminals F, G, and H, the three heater sections constitute three electrical resistances connected together by the headers E and D. The three sections are similar with equal resistances, and if the terminals F, G, and H are connected to a 3-phase supply of suitable voltage, the power input will constitute a balanced 3-phase load. On the 1,000-KW. heater in question, 50 volts are required across the terminals supplied by a water-cooled, 3-phase, step-down transformer. The entire equipment, heater, transformer and switchboard occupies a floor space 8 ft. by 12 ft. and a height of 9 ft.

At first sight it would seem that the operating power factor of a device using iron pipe to carry a heavy A.C. must be low, but this is not the case. As the current density is increased the ratio of reactance drop to resistance drop decreases with a consequent increase in power factor. A curve plotted from actual test results on an iron-pipe water heater operating on a 40-cycle circuit at a current density high enough to take full advantage of the foregoing characteristic, shows that a power factor of 90 per cent. on a 40 or 25-cycle, and 80 per cent. on a 60-cycle circuit is realised. Under average conditions the over-all efficiency, including transformer losses, should always be above 90 per cent.

The saving that can be effected by the utilisation of surplus electric power to heat water that would otherwise have to be heated by purchased fuel is in most cases estimated to be sufficient to make the installation of a heater of the type described above well worth while.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

An Electric Clothes Drier.

The *Journal of Electricity* recently gave the following details of an electric clothes drier (fig. 1), invented by an American. This is built for use in the home, and has approximately the same capacity as the average washing machine. It operates on the centrifugal principle, the outer diameter of the basket which contains the clothes travelling at 7,000 ft. per minute, throwing the water out, which in turn is replaced by air

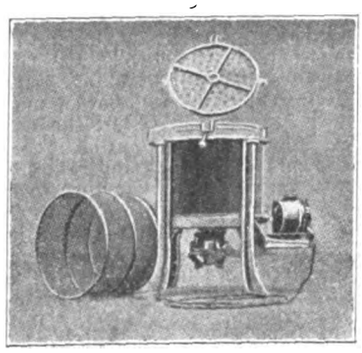

FIG. 1.—ELECTRIC CLOTHES DRIER.

drawn in from the centre and forced through the clothes. It will dry for ironing in from 12 to 15 minutes with no danger of injury to the finest piece of material and no broken buttons.

The machine occupies a space of 24 in. by 30 in. and stands 26 in. high, weighing approximately 200 lb. It is operated by a ½-H.P. electric motor through a governor clutch mounted on the driven shaft, and is automatic in its action in picking up the load, the load also governing the clutch. This clutch makes it possible to start with a motor just big enough for running the load.

A New Squirrel-cage Rotor.

MESSRS. HIGGS BROS., of Dynamo Works, Sherbourne Road, Balsall Heath, Birmingham, have recently patented a bar-winding particularly applicable to squirrel-cage rotors, constructed in the following way:—Drawn copper of suitable rectangular section is used. Before this is inserted in the rotor, one end of the bar is twisted at right angles to itself, and then inserted in the rotor core, as shown

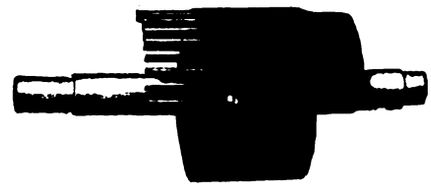

FIG. 2.

in fig. 2. The rotor is designed so that these bars, when inserted, practically touch one another at the ends. When all the bars are assembled, the other end of each bar is also bent at right angles, then the ends are welded between the joints. The finished rotor is shown in fig. 3. The advantages of the rotor constructed by this method are obvious. The usual rotor end rings are entirely dispensed with. The extension of the bar itself forms the ring. No flux or

Digitized by Google

brazing compound is used in making the joints, only pure electrolytic copper throughout. They are preferably welded with oxy-acetylene apparatus, and when this is done the ends of the bar are a continuous ring. It is a sound mechanical job, and there is not the usual fear of nuts, bolts, and screws coming loose. When the rotors are constructed and the end rings cast on, there is always the chance of poor joints. A

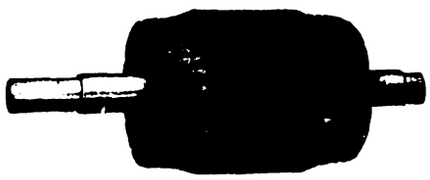

Fig. 3.

large number of these rotors are in use, and not in a single instance has a complaint been received regarding them.

Battery Testers.

The H.B. Shontz Co., of New York, has, after lengthy experiments, recently placed on the market the "Shuro" cell tester, of which we give an illustration (fig. 2). The instrument, which has been specially designed to meet the requirements both of garages and private car owners, is provided with a simultaneous volt-ammeter, mounted in such a position that it can be easily read, and is amply protected, the light above the instrument giving a clear indication of the condition of the battery. In the volt-ammeter the upper scale indicates volts from 0 to 2, and the lower one amperes from 0 to 250, the accurate voltage and amperage of the cell to which the tester is applied being thus recorded under a

Fig. 4.—The Shuro Battery Tester.

discharge test. Thus, if an eleven-plate cell shows 1.55 volts and 180 amps., it may be regarded as doing well. The makers point out, however, that voltage is not always a true guide to the condition of a battery, as all the cells may be low and uneven, and need only a recharge. Trouble is, on the other hand, present when a cell stands at 0.1 volt or more below the remaining cells, which are strong and show no tendency to weaken when the tester is connected. The device is claimed to test every cell of a battery individually and under full load, indicating the current and the voltage of each cell. A bright light is shown by the lamp when the cell is strong and a dim light when the cell is weak. The instrument, which weighs 2 lb., requires the use of a special 1½-volt bulb.

Another American invention of a similar nature is the Springfield high-rate discharge instrument, made by the Service Products Co., of Springfield, Ohio, of which an illustration is given herewith (fig. 5).—It is intended for use in the detection of damaged or faulty cells, and, as will be seen, comprises a voltmeter with reading 2-0-2, graduated in tenths, mounted on two steel posts which terminate in a convenient handle. When the points of the instrument are brought into contact with the terminals of the battery with a steady pressure and wiping effect, the current is through a fixed resistance which determines the rate of discharge. The resistance has a current capacity of 80 amps. cold and 70 amps. when hot. If the insulation of a cell is defective, the needle will gradually recede towards the centre as the high-rate discharge takes place, while if the cell has an open circuit or broken connection inside or outside, the finger will remain at zero. The instrument will not only be found useful in the accumulator repair depart-

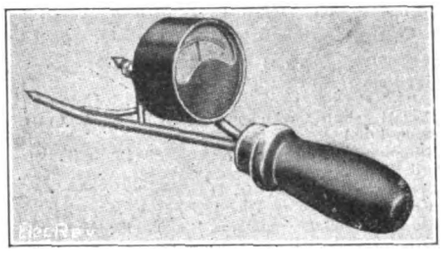

Fig. 5.—The Springfield Battery Tester.

ment of motor garages, but it can be used to test batteries *in situ*, the test of each cell only lasting from 10 to 20 seconds.

Milli-ampere Meter for the Blind.

A unique adaptation of a standard milli-ammeter has recently been made by the General Electric Co., Ltd., 67, Queen Victoria Street, E.C.4. In connection with electro-therapeutics a milli-ammeter was required which could be conveniently used by the blind to enable them to measure or maintain a definite value of current. An instrument, which reads from 0 to 50 milli-amperes, is provided with an external

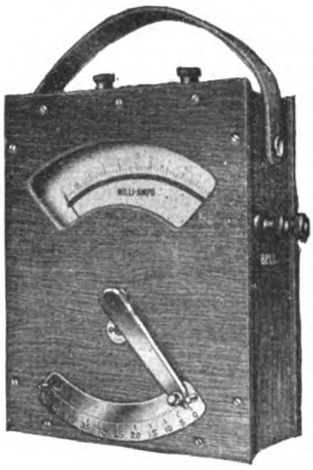

Fig. 6.—Milli-ampere Meter for the Blind.

arm moving over an embossed scale with the calibration similar to the instrument scale. Attached to this movable arm in the interior of the instrument are two contacts, either of which makes electrical connection with the pointer of the instrument. When in use the arm is set at the reading desired, and by means of a clear toned bell ringing when the pointer is touching one contact, and a muffled toned bell ringing when touching the other, the operator is able with a regulating resistance to obtain any desired current. On the other hand, if it is desired to read the current flowing, the instrument is placed in circuit with the movable arm set at zero, and as soon as the current is switched on, the clear bell commences to ring and continues to do so until the operator swings over the arm beyond the position of rest of the pointer of the instrument. The muffled bell then rings, and by a nice adjustment of the movable arm a position can be obtained in which neither bell will ring, when the reading can be taken from the embossed scale.

Electropercussive Welding.—The *American Machinist* recently published an article on the method of joining wires by connecting to the terminals of a charged condenser and bringing them suddenly together. Sufficient electrical energy is liberated by the discharge to melt the wires, while the force of the blow welds them together. A machine suitable for jointing aluminium and other wires up to No. 13 gauge is described. One wire is held in a chuck at the base of the apparatus, while the other is clamped into a holder free to slide in vertical guides. The holders are connected to the terminals of an electrolytic condenser by a circuit containing an adjustable inductance, and are kept short-circuited till required. The condenser is coupled up to a source of supply through resistances. The wires have their ends prepared by a special cutter, the switch is opened and the upper holder is allowed to fall, when, if all adjustments are correct, a perfect weld is immediately made. Oscillographic tests with No. 18 B. & S. aluminium wire show that the power expended at the weld reaches 23 kw. for an instant, but the entire weld is made in 0.0012 sec.; the total energy is about 0.00000123 kw.-hour per weld. The process is well adapted to welding copper connections to aluminium.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 6d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C. 4.

Telegraphic Address: AGEKKAY, CENT., LONDON." Code, A B C. Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

FOREIGN AGENTS:

ADELAIDE: Messrs. Atkinson & Co., Gresham Street.
AUCKLAND N.Z.: Gordon & Gotch, Albert Street; Peter G. Tait, P.O. Box 392.
BRISBANE: Gordon & Gotch, Queen St.

WELLINGTON, N.Z.: Gordon & Gotch, Cuba Street.

Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "London City and Midland Bank, Newgate Street Branch."

THE RATING OF MACHINERY.

THE remarkable change in money values which has taken place during the past few years is, of necessity, causing considerable anxiety among business men throughout the country. It is a difficulty which crops up at every turn, because there are undoubtedly many cases in which serious hardships will be caused if the practice of stereotyping present values for any considerable number of years ahead is resorted to, as is threatened in some instances. The problem is a peculiarly difficult one with regard to the rating of property generally, and whilst we believe a broad view may be taken in the matter of general rating, when the quinquennial assessment is finally made this year, signs are not wanting that in relation to the rating of machinery, the full pound of flesh will be demanded.

An important principle is at stake here, because conditions are so fluctuating that whilst he would be a rash person who would foretell any fall in the cost of labour, nevertheless the ordinary laws of economics will almost certainly come into play to bring about reductions in other directions, yet what do we find some assessment authorities doing in the matter of machinery assessments? The new valuation lists have not yet been prepared throughout the country, but it is known that in some instances where they have been prepared, the assessments have been doubled and even trebled. Hasty action of this sort is seriously to be deprecated, and we can only imagine it is based on the principle which was so strongly put forward in connection with the Profiteering Act, that a man could not be said to be profiteering if he charged for an article a price based on the cost of replacing it. If the basis of the new assessment is to be the replacement value of all existing plant, then, indeed, will an intolerable burden be placed upon industry, and every step must be taken to bring that point before the various Unions.

We are aware that the authorities in London are averse to stereotyping future legislation too much upon present conditions, but although it may be said that a new valuation will be made in five years' time, our knowledge and experience of rating authorities is such that we would rather not have the trouble and expense of arguing the case for a reduction at the next quinquennial valuation. One of the leading valuation authorities in London recently, before a Parliamentary Committee, expressed the view that values would eventually settle down at about 70 per cent. above the figures of 1914, and that is a long way from the 200 and more per cent. which we are informed is being placed upon existing assessments by some authorities. There is need for concerted action, and it is satisfactory to note that the Machinery Users' Association is keenly alive to the injustice which may well be perpetrated unless a watchful eye is kept upon rating authorities as a whole. Unhappily, it is no uncommon thing for Government Departments to differ, and although there is a desire on the one hand on the part of Departments which have not to collect taxes, to go warily, on the other hand, it cannot be overlooked that in giving evidence before the Select Committee on War Wealth, the officials of Somerset House expressed the view that values in future should be

Digitized by Google

taken on the present basis. From more than one point of view that is undeniably an unsound doctrine, desirable though it may be from the tax-collector's point of view.

In the first place, such an expression of opinion will inevitably react upon the authorities throughout the country, without investigation of the premises upon which it was based, or the circumstances in which it was offered to the Committee. More important than that, however, is the position in which manufacturers and machinery users will be placed where, as is the case almost invariably, plant exists which was bought several years ago. This merely serves to emphasise the serious position of machinery users. Much plant bought years ago can only be replaced or repaired at a very high cost, and under great difficulties even then. The result is that, if assessments are to be made upon present values, there will be a large amount of partly worn-out machinery standing in books at excessive values. In the present condition of trade, every encouragement should be given to machinery users to put their works in good order, quite apart from the general unsoundness of the policy of stereotyping the future upon a condition of affairs which must inevitably change for the better to some extent within the next few years. There ought clearly to be a differentiation between machinery, and the purchase price, with an adequate allowance for depreciation, is the only logical and sound basis.

An Epoch-Marking Paper.

THERE is, it must be confessed, a certain lack of distinction about many of the I.E.E. papers; while they are often of very great technical interest and value, they seldom touch that pitch which, like Duddell's lecture on the arc, arouses the audience to enthusiasm and marks a day with a red letter in the annals of science. But on Thursday last week Mr. Sydney Evershed, whose papers are rare but always superlatively good, once more came forward with a masterpiece of scientific literature, worthy to rank with the most noted essays on electrical science that the Institution has been privileged to hear. Indeed, in the discussion, his paper was declared to do for permanent magnets what Dr. Hopkinson's did for electromagnets, in that it swept away the devices of empiricism and established the subject on a sound scientific foundation.

The paper itself was somewhat uninviting in appearance; it offered 46 pages of good hard reading, on a subject with which the majority of the audience had little direct association. But the lecture which the author delivered, without the aid of notes, put a wholly different complexion on the matter. Lucidly expressed, and relieved by sparks of dry humour, it lightly traversed the whole field of the 20 years' work embodied in the paper, and leading on from molecular theory to experimental study, finally made it clear that the author had found a key to the secrets of permanent magnetism—a key which all the time had been hanging on the nail, so to speak, awaiting someone with the patience and insight that would enable him to see it.

While we cannot do full justice to Mr. Evershed's illuminating lecture, or to his monumental paper, we give elsewhere a report of the proceedings; and in congratulating him upon a great achievement, we may assure him that the "practical" paper which he has promised will be awaited with the keenest interest and anticipation.

The Chitty Motor.

IN our issue of October 10th, 1913, we drew attention to four motors installed at the printing offices of Messrs. United Newspapers, Ltd., which for five years had been driving two big Hoe presses. We pointed out that these motors differed in many respects from current practice, but most of all in the remarkable output obtained in comparison with their dimensions and weight, each giving 120 B.H.P. at 230-650 R.P.M., and weighing 30 cwt. They gave complete satisfaction to the mechanical superintendent of the company, Mr. G. W. Mascord, and ran at a safe temperature. Moreover, their cost to manufacture was extremely low. We urged that, in the best interests of the electrical industry, full advantage should be taken of the possibilities of improvement in output for weight and size that were evidently still far from exhausted.

Those motors were built by the Rees-Roturbo Manufacturing Co., Ltd., to the designs of Mr. Henry Chitty. As we fully anticipated, the accuracy of our statements was immediately challenged, but we did not ask our readers to accept them blindfold; we urged them to go and see the machines themselves. The correspondence which ensued ran on for many weeks, without in the least modifying the fact that the machines were solid realities and fulfilled the claims we made for them.

Had not the war intervened, the manufacture of machines of this type would, doubtless, have been developed. Over six years have passed, and the subject—so far as publication is concerned—has lain dormant, but not forgotten; we have looked forward to the resumption of activity in this quarter, and we are gratified now to be in a position to say that production has commenced, and arrangements are in progress for the manufacture of these motors and dynamos on "mass production" lines. Last week we had the pleasure of seeing two machines running on load; they were similar machines, on the Hopkinson—or rather, the Kapp—test, one acting as motor, and the other as generator, and the losses being supplied electrically by a third machine of another make. The normal rating of both machines was 500 amperes at 220 volts, 1,440 R.P.M.; they ran without sparking or undue heating, both at normal load and with 660 amperes on the motor, which load was thrown on and off repeatedly without effect on their behaviour. The weight of each machine, including its bedplate, was 1,750 lb., and its dimensions were correspondingly small. The normal input to the motor was 110 KW., and the mean efficiency 93 per cent. The specific weight was 17 lb. per KW.

These figures speak for themselves to the expert; for those who are not dynamo designers, we may say that the output is more than twice that usually expected from machines of this size—like that of the machines we described in 1913.

The Ayton Presentation.

IT was with great pleasure that we took part in the recognition by the electric vehicle industry of the splendid work that Mr. Frank Ayton has accomplished as founder, hon. secretary, and, finally, chairman of the Electric Vehicle Committee; a report of the proceedings at the dinner at which he was the guest of honour is given in our "Notes" columns to-day. The excellent progress that has already been achieved in the face of innumerable obstacles was fully recognised by the speakers, but the keynote of the speeches was the magnificent prospect that lies before this branch of the electrical industry. Never before has its future been so rosy. The eight-hour day has sealed the fate of horse traction, petrol is continually growing dearer and scarcer, and the electric vehicle is going to be the saviour of the situation. Moreover, the Electricity Commissioners have announced their intention of encouraging the use of electric vehicles, by granting powers to corporations to establish garages and charging stations; this is the supreme need of the industry, which has always been hampered and restricted in its development by the lack of charging facilities.

In its early days the industry suffered from recurring attempts, not so much to establish a sound business as to exploit the investing public, but those times, we hope, are past; the industry is now in the hands of men who are determined to establish it on a firm industrial basis, it has before it an unexampled opportunity, and we look forward to an immense development in the near future.

THE KINGSTON-UPON-THAMES ELECTRICITY WORKS.

It will be remembered that during the Municipal Electrical Convention of June, 1913, members of the M.E.A. visited the riverside borough on the completion of extensions to the electricity works which cost about £15,000. The new plant, which we described at the time,* was inaugurated in September, 1913, and was said to be practically the first of its kind to be installed in this country. Two Diesel engine sets of the M.A.N. type, each coupled to a Siemens 270-kw. flywheel alternator, were installed, the intention being to decrease fuel costs and wages and repair costs in the boiler house.

One 4-cycle set with a low fuel consumption took the whole load of the station for an average of 16 hours per day, the boilers being shut down entirely during such hours. In order to obviate the risk of stoppage, it was decided to be less costly to install another Diesel set rather than to keep boilers banked during the day. A two-cycle engine was selected, which in addition to stand-by duties, assisted the old steam plant on peak loads. During the year ended March 31st, 1918, the steam plant generated 939,122 units at a fuel cost of £9,183, or 2.346d., while the Diesel engines generated 746,913 units at a fuel cost of £1,942, or 0.623d. per unit sold.

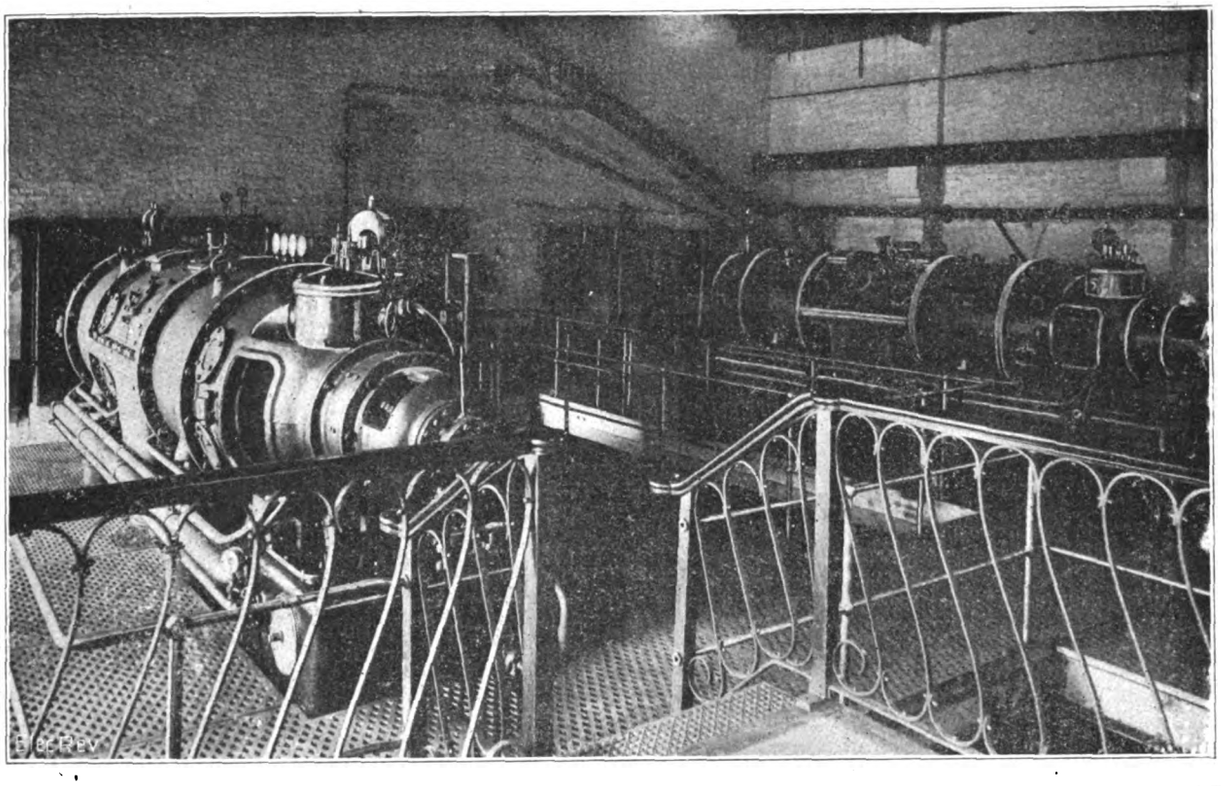

Fig. 1.—Ljungstrom Turbo-alternators at Kingston-upon-Thames.

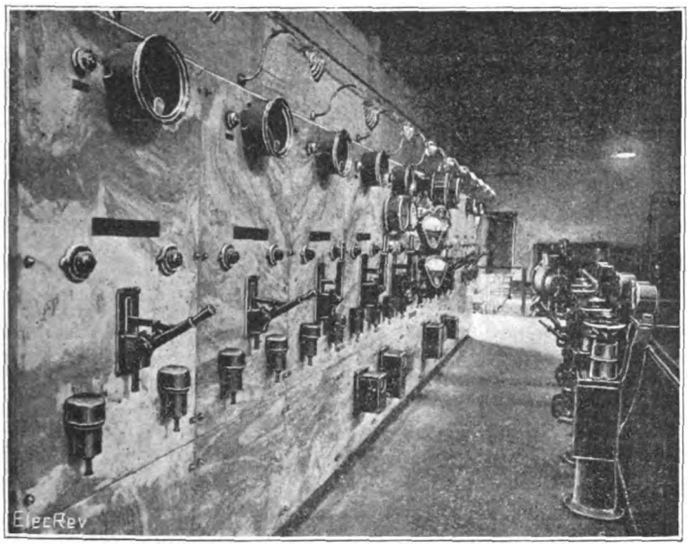

Fig. 2.—Crompton Three-phase Switchboard.

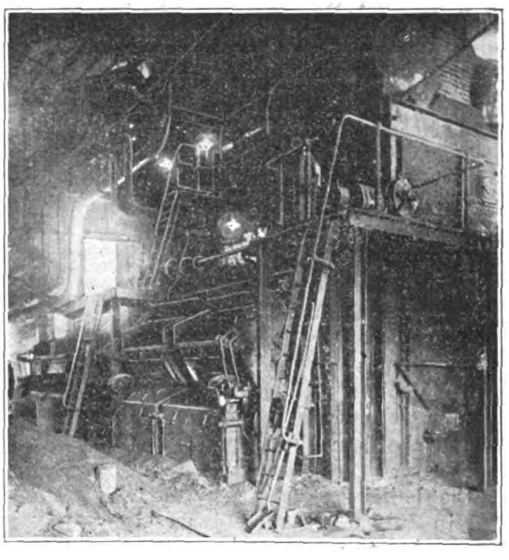

Fig. 3.—Stirling 21,000-lb. Boilers.

Following the strenuous war period, like many other undertakings of the kind, considerable trouble was experienced with the plant, and several breakdowns occurred in the latter part of 1918. Due to the heavy overload to which the plant had been subjected, a serious breakdown eventually occurred in December, 1918; to aggravate matters, some of the station employés struck work about the same time, and a total suspension of the supply seemed inevitable. However,

Mr. T. A. Kingham, together with his assistant and one or two representatives of the Brush Electrical Engineering Co., Ltd., commendably set to, and by working continuously through the holidays from December 24th to January 1st, managed to get part of the new turbo-generator plant, which was then being delivered, into commission, and were thereby able to maintain the supply. Owing to the non-delivery of the E.H.T. switchboard and gear the station was for three months successfully run and controlled from the temporary 3,300-volt, 3-phase switchboard, fig. 5, which was erected during the above-mentioned holidays.

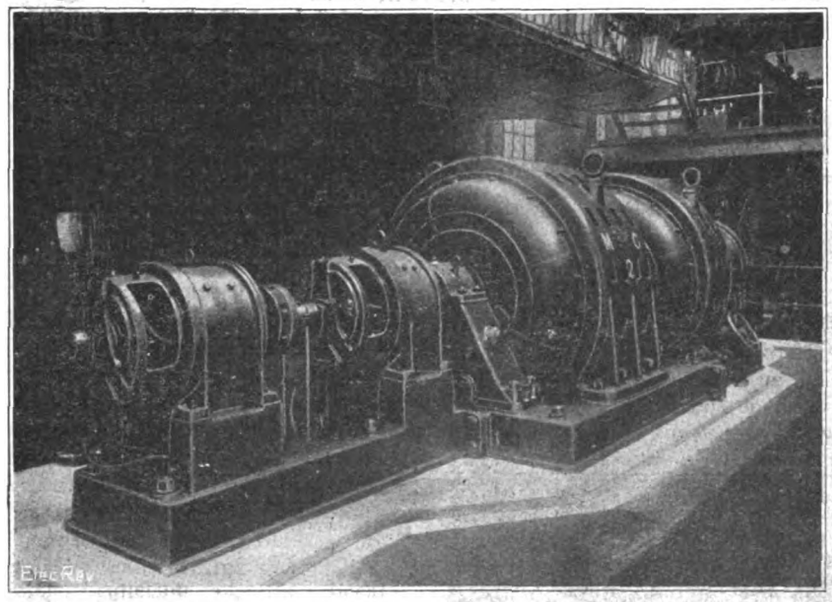

FIG. 4.—A 1,000-KW. FREQUENCY CHANGER.

In February, 1918, owing to the constantly increasing demand for power for munition works, the Town Council entered into an agreement with the Ministry of Munitions, which had approved of a 3-phase scheme prepared by Mr. J. E. Edgecombe, the then borough electrical engineer, and now consulting engineer to the Corporation, and the sanction of the Local Government Board was obtained to a loan of £25,000 for a period of 20 years at 6 per cent. for the purpose of purchasing additional electrical plant and equipment. The new installation consisted of two water-tube boilers, buildings and accessories; two 1,000-KW. steam turbo-alternators, with the necessary engine-house plant; and switchgear, distributing plant, and sub-station transforming gear. The first instalment of the new plant, consisting of a 1,000-KW. turbo-generator set, was put to work as stated above in January, 1919; a duplicate set was installed in June, and the boilers were finally completed in July of the same year. It is interesting to note that in spite of the conditions under which the first set was put into commission it ran continuously from January 1st to March 31st, 19 with but a single two hours' rest for the purpose of cleaning out the condenser.

The Kingston-upon-Thames public supply was until recently entirely single-phase, 77 periods, generation being at 2,100 volts, and the pressure at consumers' terminals, who were supplied through stepdown transformer sub-stations and pillars, was 105 and 210 volts. The single-phase generating plant consists, in addition to the two Diesel sets, of a number of Belliss steam reciprocating sets coupled to Siemens disk-type alternators. In the recent extensions, particulars of which are given in what follows, and which we recently had the pleasure of inspecting, a breakaway has been made from single-phase generation, and a 3-phase system introduced. This has necessitated a link between the two systems in the shape of two 1,000-KW. frequency-changing motor generators, which form the most interesting portion of the new plant. The new generating plant consists of two Brush-Ljungstrom turbo-alternators, fig. 1, each capable of developing 1,000 KW. The turbines, which are of the double-rotation radial-flow type, operate at a steam pressure of 200 lb. per sq. in., and 200 deg. F. of superheat. The steam consumption at full load is 12.5 lb.; at ¾ load, 13.1 lb.; and at ½ load, 14.7 lb.

The two alternators of each set, which generate 3-phase energy at 3,300 volts and 50 periods, are identical in construction, and both run at 3,000 R.P.M., but in opposite directions. From the point of view of switchgear, &c., both machines are considered as a single set, the stator windings being connected in parallel. The series-connected field windings are energised from a single exciter mounted on the end casing of one of the alternators. The rotors each consist of a solid steel forging. Axial ventilation is used throughout the machine, and both stator and rotor are mica insulated. The complete turbo-alternator is carried by its condenser, which is of the surface type, and is bolted direct to the flange of the exhaust branch of the turbine. Each turbo-generator has its own "Sirocco" air washer of the water-spray type, and its own set of Edwards air and Pulsometer circulating pumps. The condensers are on the station floor level while the turbines are on a platform on the switchboard gallery level.

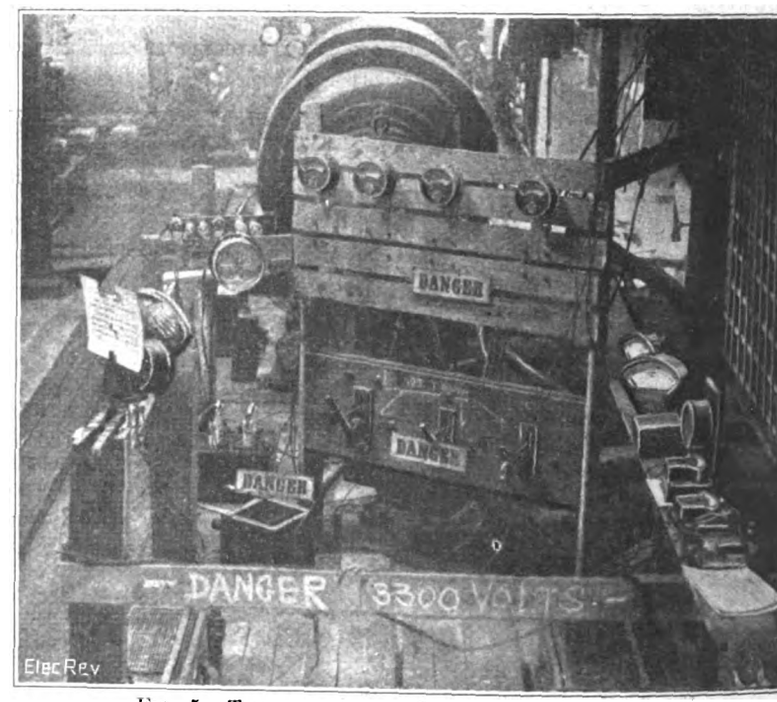

FIG. 5.—TEMPORARY E.H.T. SWITCHBOARD AT KINGSTON.

The two new Stirling boilers are each capable of evaporating 21,000 lb. from and at 212 deg. F. They are fitted with B. & W. chain grate stokers, and work in conjunction with a Green economiser. The feed pumps are of the turbine type, and their exhaust steam is used to raise the temperature of the feed water prior

Digitized by Google

to its delivery to the boilers. All water, which passes through a Bracket rotary screening plant, fig. 7, is drawn from and returned to the river Thames. Some very excellent results are being obtained with the very low-quality fuel that is being burnt; at present coke breeze with a calorific value of 8,000 B.TH.U. per lb. is being used. This is wheeled by means of hand trucks from the stock yard over a weigh bridge, and dumped before the boilers. It is then shovelled by hand into the hoppers. It is hoped at a later date to install coal-handling plant which will greatly facilitate the stoking arrangements.

The new three-phase switchboard, fig. 2, and switch-gear was manufactured by Messrs. Crompton & Co., of Chelmsford, and Messrs. Lucy & Co., of Oxford, to the order of Mr. J. G. Statter. The new board is composed of handsome grey marble panels, the synchronising panel being placed in the centre, on either side of which are located the turbo-generator and motor-generator panels, and on the outsides the feeder panels.

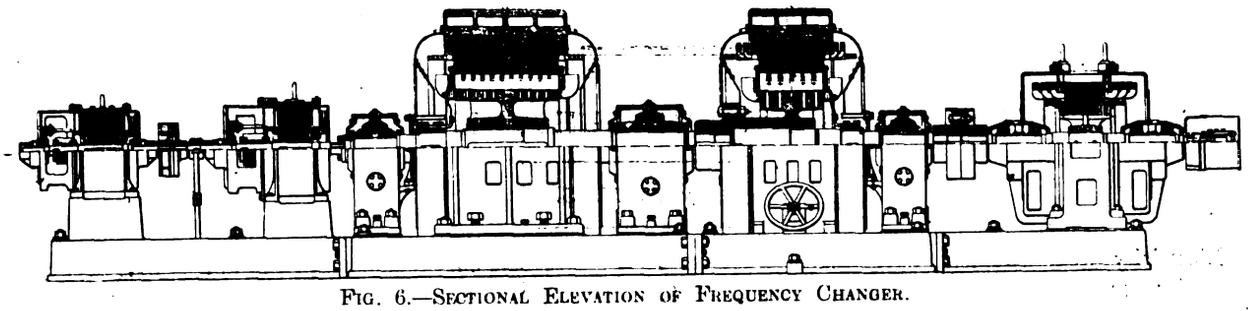

Fig. 6.—Sectional Elevation of Frequency Changer.

The 1,000-kw. frequency-changing sets consist each of five machines as follows: A single-phase alternator, a three-phase synchronous motor, a starting motor, and two exciters, one for the alternator and the other for the synchronous motor. The two exciters are provided because the voltage of each synchronous machine has to be controlled by a Tirrill regulator. The single-phase alternator has a capacity of 1,000-kw. at 2,100 volts and 75 periods, with a power factor of 0.8, and is capable of carrying a 25 per cent. overload for two hours. The three-phase, 1,450-h.p. motor, driven from the turbo-alternators, works at a pressure of 3,300 volts, 50 periods, at unity power factor. The slip-ring starting motor operates from the 3,300-volt, 50-period circuit, and is provided with a liquid starter. The complete set, figs. 4 and 6, runs at 750 r.p.m., the machines being mounted on a common bedplate with a flexible coupling between the two exciters. The three main bearings are forced lubricated, the oil being pumped by a gear pump driven from the shaft of one of the exciters; no oil cooler is fitted.

Special attention was given to the complicated problem of parallel running in connection with these sets, the conditions being as under: (*a*) The sets must run in parallel with each other on both the three- and single-phase sides; (*b*) the three-phase motors must run in parallel with the two turbo-generator sets; (*c*) the single-phase alternators must run in parallel with the Diesel and old Belliss reciprocating sets; (*d*) the load must be adjustable between the sets.

The construction of the two synchronous machines is generally the same throughout. The stator core in each case is supported between two clamping rings keyed into a cast-iron frame. It is built up of iron segments, varnished on both sides, and held in position by steel dove-tailed keys screwed to inwardly projecting ribs on the cast-iron frame. The former-wound coils were completely insulated before being placed in the core, and mica was used as the insulation between turns for the whole length of the coils; mica tubes insulate the coils on the slot portion and oiled linen and mica on the end winding. Before the outer insulation was put on the whole coils were dried under vacuum, and then impregnated with a solid compound. The mica tubes were then moulded on under pressure to ensure a solid coil and eliminate air spaces. The arrangement of the winding is such that the voltage between adjacent conductors is a minimum. A single steel casting forms the poles and hub of each rotor, the laminated pole shoes being screwed on after the coils were placed in position. A heavy amortisseur winding is provided in the pole face. Bare copper strip of heavy section wound on edge, and assembled under hydraulic pressure form the field coils. Duplicate sets of carbon brushes in box-type holders are provided for the gun-metal slip rings. In order to keep the peripheral velocity within safe limits, owing to the high speed at which the sets run, very long machines were necessary. To ensure a supply of cool air to the centres of the machines fan blades are fitted on the rotor hub with a baffle attached to the solid end shields. Further, axial holes are provided right through the stator core in addition to the usual radial vents; holes are also drilled through the rotor hub. The motor stator is carried on rollers mounted on ball bearings, and a racking gear is provided to enable the stator position to be adjusted to assist in paralleling or adjustment of load.

It was not possible to carry out exhaustive tests at the time these sets were built, as they were urgently required. They were, however, erected at the builder's works, and run for about two hours. They were then sent to Kingston, and, after erection, were put at once into service, and ran continuously day and night without any adjustment.

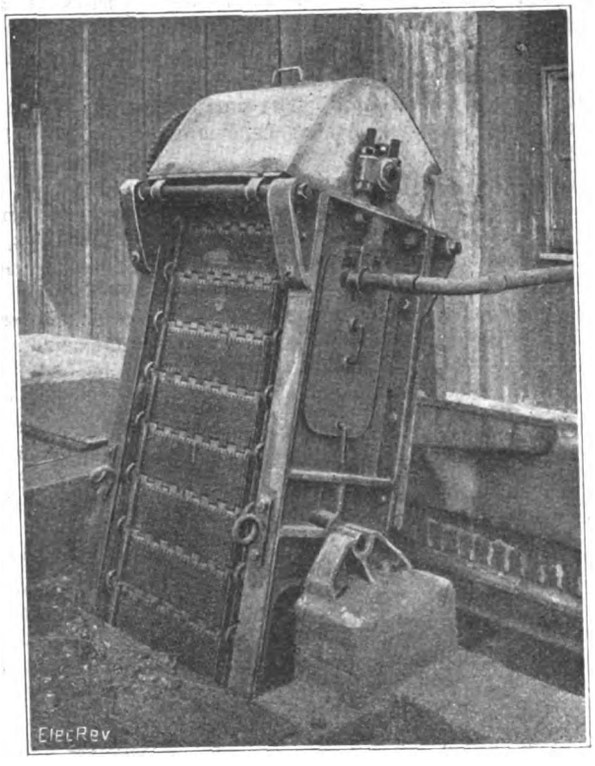

Fig. 7.—Water Screening Plant.

The whole of the turbo-generator plant, with condensers, pumps, and auxiliary plant, as well as the frequency changing sets, was constructed by the Brush Electrical Engineering Co., Ltd., of Loughborough, to

Digitized by Google

the specification of Mr. J. E. Edgecombe, who on his resignation in September, 1918, was appointed consulting engineer. The extensions were carried on by his chief assistant and successor, Mr. T. A. Kingham, under whose management the undertaking now is.

Striking results have followed on the discarding of the old plant. Last year the units sold numbered 1,750,000, and this year it is estimated that they will reach 2,500,000. It may be pointed out that only on two occasions in the history of the undertaking has a surplus been shown on the "year's" working. It will be remembered that last year there was a deficit on the undertaking of £6,000; this year, although the whole of the new plant has not yet been in operation for 12 months, that loss has been converted to a surplus of £2,500.

The demand for power has grown to such an extent that further extensions will be necessary in the near future, and it is intended to do away with the whole of the old B. & W. boiler plant and Belliss-Siemens reciprocating steam sets, and to install in its place 3-phase turbo-generating plant. The flexibility and convenience of the 3-phase system of supply is recognised, and the old single-phase system is to be eliminated entirely from all future development.

In conclusion, we are indebted to Mr. T. A. Kingham, borough electrical engineer, for facilitating the preparation of this article.

THE LOWER SEVERN ELECTRICITY DISTRICT.

By H. M. S.

The Electricity Commissioners have taken their first action under Sec. 5 of the Electricity (Supply) Act, 1919, by issuing a notice in the terms of Sub-sec. (1) and (2) of that Section, that they have provisionally determined that the area shown on the map shall be constituted a separate electricity district, to be known as the Lower Severn Electricity District, and that it being apparent to the Commissioners that the existing organisation for the supply of the district should be improved, they intend to hold a local inquiry into the matter. They invite authorised undertakers, local authorities, and other parties concerned to forward objections or representations on account of the inclusion or exclusion of any area in or from the proposed district, and also invite such parties as are mentioned in Sub-sec. (2) to submit in writing schemes for effecting such improvement in the existing organisation, including the formation of a joint electricity authority for the district. The time limit for the receipt of the objections, representations, or schemes, is July 31st, 1920.

This first action is of considerable interest as an indication of the policy which the Commissioners have adopted, but it cannot be taken as a binding precedent, as the Section referred to permits them to take a somewhat different course to that adopted in this first case.

Sub-section (1) says that the Commissioners may provisionally determine that a district shall be constituted, and that before finally determining the area to be included, notices of the intention shall be published and given to the County Councils, local authorities, and authorised undertakers in the district, and if any objection or representation is made on account of the inclusion or exclusion of any area, the Commissioners shall hold a local inquiry with reference to the area of the district.

Sub-section (2) says that where it appears to the Commissioners that the existing organisation for the supply of electricity within a district provisionally determined should be improved, the Commissioners shall give notice of their intention to hold a local inquiry into the matter, and shall give to authorised undertakers, County Councils, local authorities, railway companies using or intending to use electricity for traction purposes, large consumers of electricity, and other associations or bodies which appear to be interested, an opportunity to submit a scheme or schemes for effecting an improvement, including proposals for altering or adjusting the boundaries of the district, and for setting up a Joint Electricity Authority.

It is provided that the area of the district shall not be finally determined until after the inquiry into the improvement of the organisation for supply has been held.

It will be seen that the notice under Sub-Section (2) cannot be given until a district has been provisionally determined, but that it need not be given at the same time, or, indeed, within any prescribed time.

The Commissioners have chosen in this case to give the two notices in one document—naturally in separate paragraphs following the wording of the Act—and to name the same date for the receipt of (*a*) objections to the delimitation, (*b*) schemes for the improvement of the supply organisation.

This may be taken as showing the disposition of the Commissioners to save time, and to meet the convenience of those interested by making one local inquiry serve the two purposes of dealing with objections and representations concerning the area, and with schemes for the improvement of the supply. As the definitive delimitation of the area can only be made after the local inquiry for the second purpose, and as objections on that matter can be brought up then, it appears that the Commissioners will be able to eliminate the local inquiry dealing only with questions of area.

This action of the Commissioners may rather startle regular civil servants and legal advisers of Government Departments as taking a liberty with an Act of Parliament, but any formal objection of that kind can be easily met by a formal division of the one inquiry into two parts, if thought desirable. As there is no limitation to the persons or bodies who may submit objections to the area, whilst there is a limitation—though one which is very wide—to those who may submit schemes, such a division may be convenient. But if there are no objections to the area, no inquiry on that is required by the Act.

Whatever views may be taken by the formalist, everyone concerned will be grateful to the Commissioners for their evident desire to concentrate and shorten the proceedings.

It may be noted that the Commissioners may (not shall) make rules to govern the holding of these inquiries and the costs thereof. No such rules have yet been published, so that little can be said about the procedure. Presumably some rules, sufficient to guide the parties interested, will be made known in good time. The Commissioners may require any person to attend as a witness, give evidence, and produce documents under penalty for failure without reasonable excuse.

To come back to the Lower Severn District, the curious may wonder why this district has been selected for the first action. No doubt the same question would have occurred to them had any other district been selected. The Commissioners have to start somewhere, and they may even have made the selection by lot. But it is perhaps not unconnected with the choice made that some of the authorised undertakers in the district, on the initiative—it is believed—of Mr. Faraday Proctor, have been getting together and discussing the formation of a joint electricity authority. The Commissioners may have thought this evidence of the spirit of co-operation a good omen for a satisfactory arrangement, which they naturally desire to achieve by their first essay. If the inquiry shows a general desire to co-operate and an absence of the jealousies which sometimes exist between neighbouring authorities, it will establish a good example which will have effects in other areas.

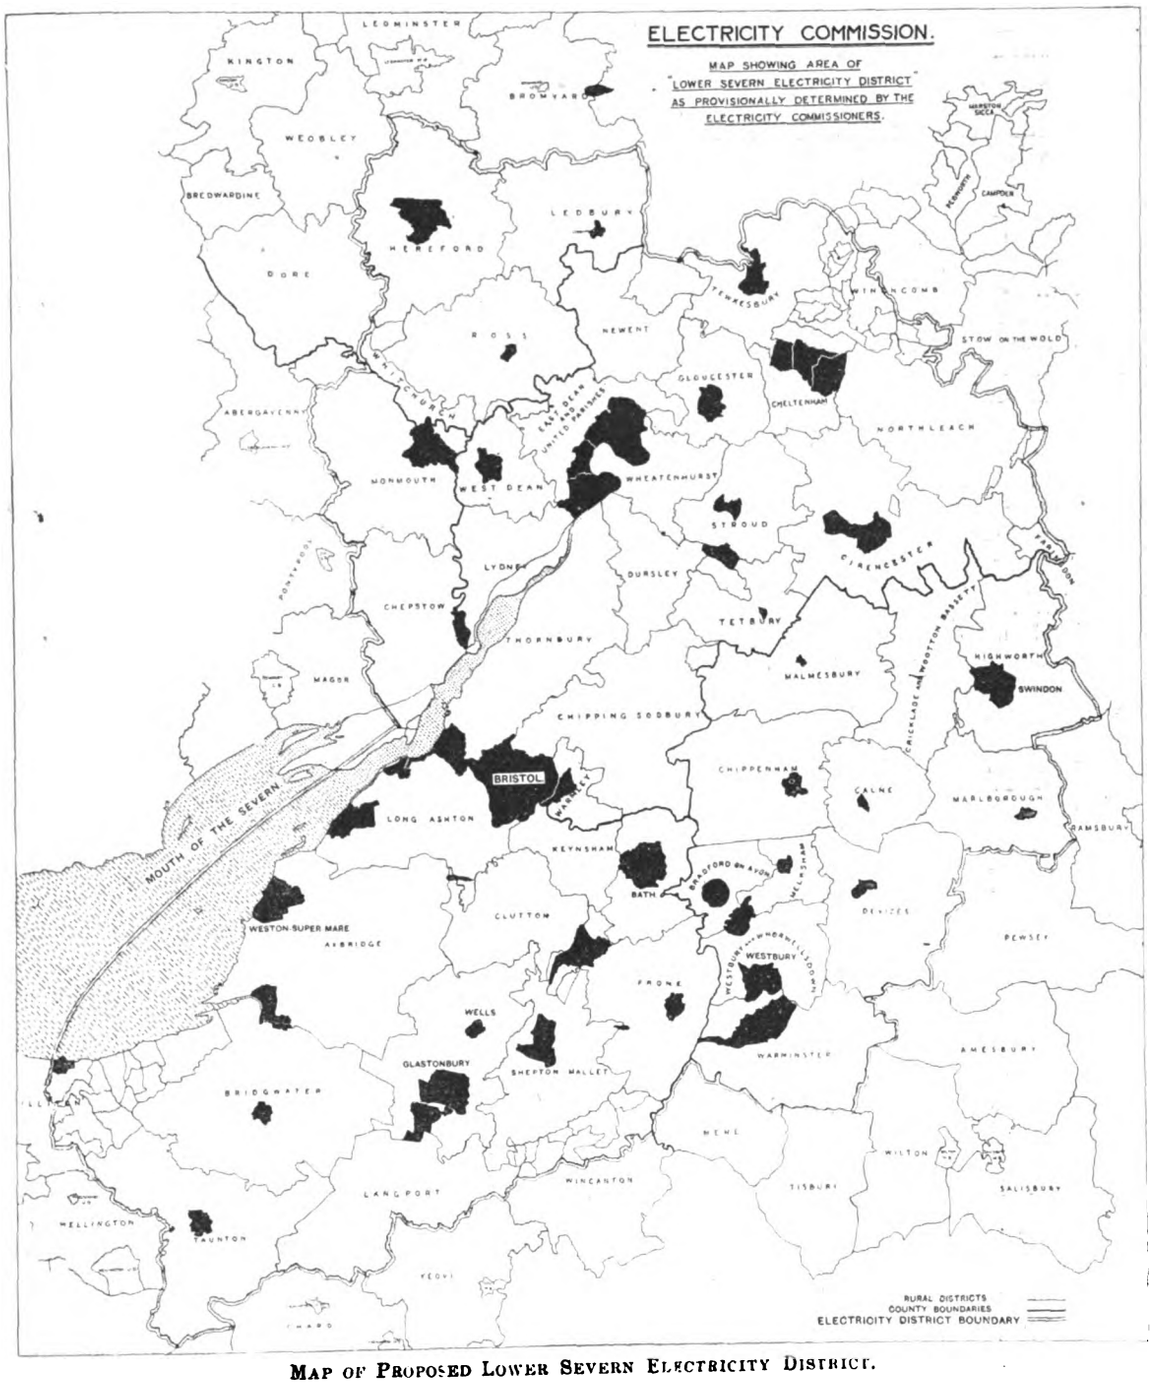
Digitized by Google

The area delimited provokes a more useful line of inquiry. Its extreme dimensions are about 75 miles, north and south, by 50 miles east and west, covering somewhat over 2,000 sq. miles. Excepting for the eastern bank of the Severn between a point about 9 miles east of Minehead, and one opposite the mouth of the Wye, which forms about half the length of the western boundary of the district, the boundaries do not coincide with any particular topographical features, or with county boundaries as a rule, though the boundary of Gloucestershire, with Worcestershire and Oxfordshire, is followed for some distance.

Gloucestershire is the only whole county in the area, which otherwise covers parts of Herefordshire, Monmouthshire, Wiltshire, Somersetshire, and some small parts of Worcestershire detached in Gloucestershire. The shape of the area also shows that it has not been determined by simple geometry. The most likely suggestion is that consideration has been given to the position of existing or projected large stations, and the distances to which they can economically supply. Colour is given to this idea by the obvious fact that the only large generating station in the area is Bristol, and that the Severn bank offers fuel and water facilities for a super-station. Bristol is not exactly central to the area, but nearly enough so to suggest that that is the vicinity contemplated for the supply centre. If one takes population as indicating potential demand, Bristol is much more central with reference to this than with reference to area.

One remarkable feature of the district is that it covers territory with a very wide range of character with respect to industries and density of population. Bristol, with its port of Avonmouth, is a busy manufacturing and shipping district. None of the other towns have any considerable industries, excepting Swindon, with its railway shops. Gloucester also has some factories. Some of the smaller towns, such as Frome, Bridgwater, and Westbury, have some old-established industries, mostly of small magnitude individually. Most of the other towns in the area are of the quiet market-town and residential type, such as Bath, Cheltenham, Hereford, Wells, and Marlborough. The anticipated development of shipbuilding in the erstwhile national yards on the Wye will change that district when the development is realised. But by far the greater part of the area is rural, much of it pastoral. Without statistics at hand, one does not care to hazard figures of population density, but has a general impression that it is a pleasant, quiet, uncrowded, country-holiday sort of territory. Weston-super-Mare is, of course, a popular seaside resort.

(To be concluded.)



MAP OF PROPOSED LOWER SEVERN ELECTRICITY DISTRICT.

The Proposed Capital Levy.—On May 12th the Executive Committee of the Federation of British Industries instructed the Taxation Committee of the Federation to oppose by all means in its power any suggestion of a capital levy on so-called war wealth.

Digitized by Google

ELECTRICITY SUPPLY AUTHORITIES AND THE LAW OF RATING.

By W. VALENTINE BALL, O.B.E.

This being the year of the quinquennial valuation, those who are interested in the supply of electricity will sooner or later be getting into touch with the rating authorities.

Even in normal times, there are reasons why a revaluation is necessary and desirable once in five years; but much of an extraordinary character has occurred since last there was a valuation. The cost of generating electricity has gone up by leaps and bounds; special legislation has enabled lighting authorities to increase their charges; while various Acts of Parliament passed by a legislature which, in the exigency of the times, was bound to find revenue, has laid charges upon this as upon many other forms of industry. In these circumstances a brief review of the principles of the law of rating as it applies to electrical undertakings may be found acceptable.

To ascertain the rateable value of an ordinary dwelling house is a comparatively simple matter. The overseers are required, in making the new valuation list, to fix the gross value of all properties in the borough at an amount corresponding to the annual rent which the tenant might reasonably be expected, taking one year with another, to pay for the premises, if the same were let on an annual tenancy, and the landlord undertook to bear the cost of repairs.

When, however, we come to consider a highly complicated piece of property like an electricity supply undertaking, the ascertainment of the hypothetical rent is by no means a simple matter.

As such a person as an actual "tenant" of an electricity supply undertaking is a creature unknown, it has long been the practice, in rating gas companies and similar undertakings, to have regard to the profits which such a concern would bring in. Three leading principles of law are as follows:—

(*a*) In valuing the works, mains, &c., of an electricity supply company for the purposes of rating, the profits earned by the company are taken into account.

(*b*) The exercise of the right to lay down wires and send electricity through them, amounts to an occupation in law and so is rateable.

(*c*) If the electricity works belong to a municipal corporation or other local authority, that body is rateable, although the profits earned are devoted to public purposes.

Let us now examine the method by which the rating authorities endeavour to ascertain the hypothetical rent.

The first step is to ascertain the net receipts. This is done by taking the receipts of the company from every source, and subtracting therefrom the ordinary working expenses (other than the cost of repairs, insurance, &c., which come in later on). The very substantial items coal and wages would, of course, be deducted. Having ascertained the net receipts, it is necessary to inquire how much of them a tenant would be willing to pay as rent to a hypothetical landlord. He would not, of course, pay the whole receipts as rent, as he would not then have any incentive to embark on the undertaking. There must be a deduction for "tenant's profit," sometimes called "tenant's share." It is worked out as a percentage on the tenant's capital. The tenant's capital is the value of his loose stock-in-trade, and a sufficient capital sum to enable him to provide for working expenses. It would not, of course, include the value of the boilers, engines, dynamos, or other fixed machinery at the generating station, but it would include the meters on consumers' premises, and all the loose tools, &c. A percentage is then taken on the tenant's capital, and considerable difficulty is often experienced in deciding what this should be. At the London Quarter Sessions the usual practice in rating the property of a gas company is to take 5 per cent. for interest, 10 per cent. for trade profits, and 2½ per cent. for risks and casualties, making 17½ per cent. in all.

Having deducted the tenant's profit, we arrive at the gross value of the undertaking. According to the rule laid down in Statute (*supra*), the cost of repairs, renewals, and insurance sufficient to maintain the hereditament in a state to command the rent must be deducted from this, inasmuch as these charges fall on the hypothetical landlord. Making a final deduction of the rates, which the tenant has to pay, we arrive at the rateable value of the whole undertaking.

In London, as the rates are only revised once in five years, it is necessary to determine what year is to be considered for the purposes of rating.

Hitherto we have proceeded upon the assumption that the entire undertaking of the company is situated in one parish or rating area. In such a case there is no necessity to consider whether the profits, upon which the rateable value is founded, are earned at the generating station or at the premises of the various consumers. But where, as nearly always happens, the undertaking is distributed over many parishes, difficult questions arise. For instance, the generating station, which is only indirectly productive, may be in one parish, while the directly productive part of the works may be distributed over the company's whole area. How are the profits to be apportioned? The difficulty is got over by considering the claims of all the different rating areas together.

In dealing with this question, rating authorities have recognised the fact that the undertaking of a gas or a water company is very similar to that of an electricity supply company. The principle adopted in the case of a water company was laid down in 1847 in the case of R. *v.* Overseers of Mile End Old Town (1847) 10 Q.B., 208. There the works of a water company extended into several parishes. The rateable value for the purposes of poor rate, of the entire works, was £30,800. The rateable value of the reservoirs, buildings, &c., valued as land and buildings deriving value from their capacity of being applied to the objects of a water company was £6,500. It was held that the rateable value ought to be apportioned among the several parishes in the following manner: "The rateable value of the reservoirs, buildings, &c., valued as above, to be first deducted from the total rateable value, and distributed among the parishes in which this portion of the works was situate, according to the extent of such works in each parish; and the residue of the rateable value to be apportioned among the parishes containing the service pipes, in the ratio of the net profits produced in each of those parishes.

Mr. C. A. Webb, in his "Law and Practice of Rating and Assessment (1910)," p. 170, points out that revenues may be thus ascertained:—

Gross receipts—			
Sale of electricity	£74,361		
Rental of meters	4,620	£78,981	
Deduct—			
Generation of electricity (*a*)	19,053		
Distribution of electricity (*b*)	2 460		
Management and general expenses (*c*) ...	6,430	27,943	
		£51 038	

(*a*) In the item generation of electricity are included the following expenses: Coals, and other fuel, oil, waste, water, engine-room charge, proportion of salaries of manager and superintendents, wages, &c., at generating and sub-stations.

(*b*) Distribution of electricity includes the following expenses: Proportion of salaries of manager and engineers, wages, repair and maintenance of meters, and other apparatus at consumers' premises.

Digitized by Google

(*c*) Management and general expenses include salaries and remuneration of directors, secretary, clerks, collectors, and auditors, stationary, printing, and general establishment charges and law expenses.

Tenants' capital includes meters and other appliances at consumers' premises, tools, furniture, and five weeks' working expenses.

Rating of Works which Include Plant, &c., in Excess of Existing Requirements.

It often happens that electrical undertakings have extra space, and sometimes spare plant, which is in excess of their existing requirements, and is laid down for the purpose of meeting extensions in future years. The question whether this part of the property is to be included in the rating has been considered in a number of cases, but not electric supply cases. In R. *v.* South Stafford Waterworks, 1885, 16 Q.B.D., 359, the indirectly productive works were largely in excess of the then existing requirements of the company, and had been constructed for use in future years. The rateable value of the whole system was agreed, the point in dispute being the proper amount of deduction to be made therefrom. It was found that if only so much of the permanent works as was required for the purposes of the present supply was included in the rating, the rateable value of the whole would be materially diminished. The following passage from Lord Esher's judgment in the Court of Appeal serves to show the attitude taken up by the Court:—

"There might be works of the undertaking which had not become part of the actual system, as, for instance, a reservoir or a second lot of engines not yet used at all, but constructed with the view of becoming part of the works in the future. Such could be no part of the existing system of works, but would be intended for another system, and would, of course, be rejected in making the calculation. But that is not the case, for here every part of the works is in actual use, though they are too large for the supply of water at present required. . . . But as the works in use are in excess of the present requirement, a tenant taking the whole or part of the property in a particular parish ought not in justice to be asked to pay the same rate of rent as he would if all the works were earning profit. Therefore, if the 3¼ per cent. mentioned by the arbitrator is the ordinary percentage upon the value of the capital laid out, one would think that the percentage in this case should be reduced to 3 per cent., or less." It would seem from this case that it would be perfectly proper for a rating authority to make a reduction on account of the spare space inside a generating station. The question whether there could be a reduction for a spare "set" is rather different, because prudent people would not run a large station and undertake to give a continuous supply without making provision for breakdown.

There remains to be considered an important question which has arisen in relation to excess profits duty. Is this duty to be deducted before arriving at the profit of the hypothetical tenant? It has long been recognised that income tax was not so deductable. The question arose and was decided in the case of Port of London Authority *v.* Overseers of the Parish of Chadwell St. Mary, 35 T.L.R., 84, which came before the King's Bench Division on November 13th, 1918. The Authority had been assessed by the Commissioners of Inland Revenue to pay a very considerable sum in respect of excess profits duty, which they contended should be taken into account before arriving at the profit for the purposes of rating their docks. In the course of his judgment, in which he decided that the excess profits duty should be taken into account, Mr. Justice Darling said: "I do not think that he (meaning the hypothetical tenant) could properly arrive at a good opinion as to whether he would be wise in taking the Tilbury Docks unless he did consider whether before he put anything in his pocket he would have to pay the excess profits duty; and if he said, "I will give such and such a rent without considering it," I think he is a man who might make a very bad bargain; but that is not the kind of man the Statute contemplates."

It is interesting to recall a fact noted in the Electrical Review early in 1918 that the Hendon Electric Supply Co. contested this point before the Assessment Committee at Hendon, but the decision was held over pending the decision in the above case.

THE ROYAL SOCIETY'S SOIRÉE.

On the night of May 12th a large and representative gathering of Fellows of the Royal Society and their friends assembled at Burlington House, London, on the occasion of the first of the two annual conversaziones, that confined to men only, that are held by the Society. Sir Joseph J. Thomson, O.M., D.Sc., president, received the guests. As usual on these occasions, main interest centred on the exhibition of the new scientific discoveries and developments of the year, and the keenest attention was paid to the demonstrations which took place in the course of the evening and to the inspection of apparatus, much of which was seen in operation. There were about 47 exhibits, and although few could strictly be called electrical in nature, some 13 of them employed either electricity or magnetism in one form or another. We shall confine our remarks to a brief reference to the latter exhibits.

Mr. A. A. Campbell Swinton, F.R.S., president of the Wireless Society of London, gave a short exposition (illustrated by lantern slides) of wireless telephony in connection with an experimental demonstration by Marconi's Wireless Telegraph Co., Ltd., from its works at Chelmsford. The apparatus consisted of an amplifying detector and note magnifier to which was connected a loud-speaking telephone, enabling speech to be heard all over the lecture hall. The aerial consisted simply of a 3-ft. square frame wound with a few turns of wire and placed on the lecture table in the room.

Marconi's Wireless Telegraph Co., Ltd., exhibited wireless telegraph apparatus which consisted of a marine type direction finder, transmitting and receiving valves, a double note magnifier, and auxiliary apparatus.

The Botany Department of the Imperial College of Science and Technology had on view a recording porometer which was in operation. The instrument recorded the rate at which air, under slightly reduced pressure, was drawn through the stomata (pores of a plant leaf) into a glass cup fixed on the under surface of the leaf. It thus gave a measure of the size of the pores. Each time a bubble of air so drawn in escaped from the lower tube it momentarily made contact between a column of mercury and a platinum wire; the electrical current which then passed was made to move the recording pen on the surface of a revolving drum.

Mr. A. V. Hill, F.R.S., showed thermopiles for investigating the thermal or the thermo-elastic properties of muscles. When a muscle is stimulated heat is produced in four separate stages; first, in the development; secondly, in the maintenance; thirdly, in the disappearance of the mechanical response; and lastly, in the process of oxidative recovery. The heat production is recorded by means of delicate insulated thermopiles, and a sensitive photographic recording galvanometer. When a muscle is stretched, or released after stretching, complex thermal effects are shown by the use of the thermopiles; these thermal effects throw considerable light on the mechanical and elastic properties of muscle.

Amongst the magnetic compasses illustrating recent developments that were exhibited by the Admiralty compass department were two standard types of aircraft

Digitized by Google

compasses, and examples of aperiodic compasses for use in ships and aircraft. The aperiodic system adopted in these instruments is the result of investigations of Mr. G. T. Bennett and the late Lieut.-Com. C. Campbell.

The Meteorological Office had on view new instruments and diagrams, and amongst the latter records of the magnetic disturbance of March 23rd and 24th, 1920, were shown, together with photographs of auroræ for height measurement; also records of the frequency of thunderstorms on the route between England and Australia and at selected stations in Africa and South America.

Messrs. Adam Hilger, Ltd., exhibited a vacuum concave grating spectrograph which has been specially designed for the investigation of the Schumann & Lyman regions of the spectrum. No refractive substance is introduced, but the whole spectrum is obtained with one setting of the grating by the use of two slits. A magnetically-operated shutter is provided which enables two exposures to be made.

The apparatus for air navigation that was shown by the Air Ministry Laboratory included Capt. Weir's (Littrow projection) diagram applied to the purpose of obtaining position lines from wireless telegraphic bearings, which application was suggested by Commander Veater, R.N.

Clays treated by electro-osmosis, and photo-micrographs of raw and purified clays, together with crucibles and other refractory specimens, were exhibited by the Osmosis Co., Ltd. The phenomena of electrical osmosis, whereby matter in a very finely divided state is capable of being influenced by an electrical potential, are applied in practice to the process of purification of clays. The equipment necessary to obtain osmosed clay consists of a blunger, settling tanks, and the osmosis machine. The latter is composed of a rectangular trough in which is arranged horizontally a cylindrical metal anode, which is surrounded, beneath the surface of the slip and at a short distance from it, by a laminated cathode, through which the clay slip is driven by paddles. The cylinder is made to revolve slowly, and the dried purified clay is collected by means of a scraper.

Mr. E. A. Reeves's apparatus for showing the existence of a true north and south directive force in the electricity of the atmosphere consisted of a large glass bottle with an india-rubber stopper, from which was suspended by a fibre of unspun silk a gold-leaf paper indicator. The inner side of the stopper was covered with paraffin wax, and the bottle was coated inside and out with shellac varnish, the whole being mounted on a tripod stand. On a calm, clear day if the apparatus is set up in a high open space, and screened from the direct rays of the sun, it will be found that, after the paper has been electrified by touching it with vulcanite rubbed on dry cloth, and left for some time, it will oscillate about evenly on either side of the true North and South line, or come to rest approximately in that direction.

Mr. A. Mallock, F.R.S., showed apparatus that he used in experiments to determine the variation of rigidity with temperature. The specimen to be tested formed part of a torsion balance in which the restoring couple was supplied by the torsion of a long thin wire together with that of the specimen, the latter being in the form of a short wire or narrow strip about 2 in. long. The specimen and lower part of the balance could be immersed in a tube of fluid kept at any desired temperature. The periods of oscillation were automatically recorded electrically for various temperatures, and the ratio of these periods furnished the necessary data for determining the ratio of the rigidities. In making an experiment the oscillations were maintained continuously by an electrical device, the specimen being immersed successively in water at 100 deg., at room temperature, in carbonic acid, in alcohol and in liquid air.

Major G. W. C. Kaye's collection of radiographs illustrating some recent developments in the use of X-rays for the examination of metals and other substances was of much interest. The specimens exhibited included, amongst others, Heilbron's radiographs of paintings by old masters, from an examination of which it was clearly apparent that some of the figures depicted in the original had been painted out or modified at a later date.

The Royal Observatory at Greenwich had on view, transparencies of the May 29th, 1919, total eclipse of the sun, showing the eclipsed sun and surrounding stars, corona, and great prominence; also photographs of the sun and sun spots, together with records of the magnetic disturbance of March 22nd-25th, 1920, and a diagram showing the variation of latitude from 1912 to 1919.

Finally, Dr. J. C. Mottram and Dr. E. A. Cockayne demonstrated the presence of fluorescence in *Lepidoptera* by means of ultra-violet radiation. The beam of ultra-violet rays was produced by a quartz mercury-vapour lamp in a box with a window made of glass invented by Prof. Wood, which is transparent to radiation of wave lengths lying between 3,900 and 3,100 A.U., but opaque to light. Only a small proportion of the *Lepidoptera* examined have proved to be fluorescent, the most brilliant being geometrid months of the genus *Ourapteryx* and allied genera.

A CLOUD-BELT OF SOLAR ELECTRONS.

(Note by *Epsilon*.)

THE following letter from the Rev. Fr. A. L. Cortie Director of Stonyhurst College Observatory, recently appeared in the *Times*, and was reproduced in the *Tablet* of April 17th.

As a striking sequel and supplement to cognate matter presented in the ELECTRICAL REVIEW of December 19th and 26th, 1919, also March 5th, 1920, Father Cortie's glowing and vivid description acquires additional point owing to the electronic interest attaching to his reference to clouds of electrified particles—with all the vistas his graphic picture thus opens out.

Notwithstanding the few weeks elapsed since these events happened, this matter is by no means obsolete, or out-of-date, especially as time has been utilised to obtain from ocean cable authorities some reply to Father Cortie's final query as to the practical effect of the March 22nd-23rd disturbance upon the working of ocean cables.

Surely enough, we hear from a leading authority responsible for the working of several ocean cables laid fairly due east-west, that on March 22nd-23rd, earth-currents were heavy—at times reaching 60 volts. Practically, however, effective working was maintained almost continuously, actual stoppages having been few, and of quite short duration.

FATHER CORTIE'S *Times* LETTER.

The indisputable connection which exists between a disturbed state of the sun's surface, as evidenced by sun spots, and terrestrial magnetic storms, was strikingly exhibited in the great sun-spot group which crossed the sun's visible hemisphere, March 16th-29th, and the violent magnetic storm of March 22nd-23rd. The sun-spot group, which was easily visible to the naked eye, was the greatest that has appeared since August, 1917. It covered an area of about eight thousand millions of square miles, more than ten times the superficial area of the whole earth. When crossing the sun's central meridian it extended over 39 degrees of longitude, representing a total length of about 180,000 miles. It was six degrees below the sun's equator, almost in a line with the earth.

This same region of the sun had begun to be disturbed at the end of last December, and at the end of January a fine long train of spots had developed, extending over 25 degrees of longitude, and similar in appearance to the great group of March. In the intermediate rotation of February the region of disturbance was marked by a few small spots.

From this huge area of solar disturbance proceeded clouds of electrified particles, driven into space most likely by the pressure of the sun's light. Into this belt of invisible clouds the earth entered at a few minutes past 9 a.m. on March 22nd and instantaneously the signal of the event was given to all the magnetic observatories over the world by a sharp to-and-fro movement of the needles. The end of the storm occurred at about 8.50 a.m. on March 23rd. The earth's orbital velocity is 18¼ miles per second, and in the stated interval of time it would have travelled more than a million and a half miles,

Digitized by Google

which number furnishes some idea of the lengthwise dimensions of the cloud-belt through which it rushed.

Meanwhile the earth was turning on its axis, and during the daylight hours the force of the earth's magnetic field was increasing, and the direction needle was swinging westward, while the opposite conditions obtained during the night hours. Upon this general movement of the needles many rapid and violent oscillations were superposed, especially between 16 and 20 hours on March 22nd, and between midnight and 4 hours on March 23rd. To give some idea of the violence of the storm, the spots of light, reflected from the mirrors attached to the delicately suspended needles, went quite beyond the limits of registration on either side of the drums carrying the photographic sheets. This means that the total range in force was at least forty times what it had been on magnetically normal days during January and February. The direction needle experienced swings of 90, 120, and 130 minutes of arc W. and E. during short intervals of time. The total range of this needle was 160 minutes of arc—that is, the compass at Stonyhurst would at times have given directions more than a degree from the true position. During this storm the swing of the needle was increased thirty-two-fold its deviations during the past two months. The supposed reception of extra-terrestial signals on the wireless apparatus of several stations, as recently announced, pales into insignificance beside such movements of the needles, controlled from a distance of nearly 93 millions of miles. The wireless signals could probably be traced to a similar solar origin. The end of the storm was marked by a rapid quivering of the needles, which was continuous during the last four hours.

The visible evidence of the passage of the earth through the cloud-belt of particles was furnished by a fine display of the Aurora Borealis. As seen by Lieut.-Col. Penny, R.A.M.C., the commanding officer of Queen Mary's Military Hospital, Whalley, in our immediate neighbourhood, it consisted of broad beams of flickering light which reached nearly to the zenith. Across these beams, near their summits, lay an oblique band of light, waning and waxing in intensity. In colour the display was mostly white, with a red tinge in parts. It lay almost symmetrically about the magnetic meridian.

It will be interesting to learn whether the earth-currents, which at times interfere seriously with the transmission of telegraphic messages, with cable-laying operations, and even with the running of the tramways, were experienced in any force on this occasion.

LEGAL.

THE IMPORTANCE OF REGISTERING UNDER THE BUSINESS NAMES ACT.

IN the Shoreditch County Court, on May 11th, before Judge Cluer, the Electrical Repair & Manufacturing Co., of 187, Goswell Road, E.C., electrical engineers, sued Hettie Anders, of 35, Darenth Road, Stamford Hill, as administratrix of the estate of Nat Anders, to recover £7 12s. 6d. When the case was called on Judge Cluer asked if the firm were registered under the Business Names Act, and ascertained that through ignorance they were not. His Honour then said he could not hear the case, as a firm could not sue under a contract unless they were registered under the Business Names Act. Their solicitor, Mr. Whitton, would tell them how to get relief if it had not been wilful. Plaintiffs' Representative: It has not been wilful. Judge Cluer: Well, he will tell you, but I cannot hear the case now; it is dismissed.

Indian Water Power.—The February issue of *Indian Industries and Power* gives a brief history of hydroelectric developments in India. It is stated that the Municipality of Darjeeling was the first authority to take advantage of this cheap form of motive power by the installation, in 1897, of two separate plants operating in parallel under heads of 275 and 650 ft. The Cauvery Falls, which is now one of the principal sources of hydroelectricity in the country, was first exploited in 1902, when the power was transmitted a distance of 92 miles to the Kolar (Mysore) goldfields. In 1903 the Government erected a plant for the production of energy for a cordite factory at Karteri Falls, Madras, obtaining an effective head of 624 ft. From the rapids of the Jhelum river power was obtained, in 1909, for dredging the river, by means of a timber flume 6½ miles long. There were several small developments up to 1914, when the Tata Hydroelectric Power Supply Co. made its first large installation at Khopoli. Obtaining an effective head of 1,725 ft., maintained during the dry season by means of extensive reservoirs filled during monsoon periods, a total development of 67,000 H.P. was made. The energy was transmitted, at a pressure of 100,000 volts, a distance of 43 miles. The Tata Co. owns the largest hydro-electric plants in India, the Andhra Valley installation, which is the largest mentioned in the article, possessing a total development of 68,000 H.P.

ELECTRICAL HAPPENINGS OF INTEREST.

[NOWADAYS the lay Press is not slow to cater for an enlightened public which appreciates technical news—especially if it relates to the latest wonder-invention. It behoves us to move with the times.]

(From our Codford Representative.)

A strange accident took place on Wednesday afternoon. It appears that P.C. Eyesharp noticed a young man perched on the roof of a tramcar, and apparently tampering with the overhead wire. He shouted a warning, and this so startled the young man that he overbalanced, and, narrowly missing a fatal shock from the wire, fell to the ground.

I called at the hospital later, and gathered from the young fellow that he is a student at the local technical college, and had been testing a certain law of Umpire, a well-known scientist of the 17th century. Armed with a compass, he had, prior to the disastrous experiment on the tramcar, already derived great practical benefit from tracing our electric mains.

He pointed out that the magnetetic energy of the tramway and other wires is sheer waste. With commendable zeal, he has already begun a revolutionary article on "Our Wasteful Electric Systems."

(By Private Wireless from Sparkeville.)

A distressing fatality occurred on Monday in the presence of a number of well-known electrical experts. The latter were investigating the claims of a local man known as "The Voltage Diviner." This worthy had found that high-tension currents did not harm him, and that he could actually calibrate himself. The Meteorological Office having announced the imminence of a thunderstorm, a demonstration before a number of experts was arranged. The Voltage Diviner was to conclude by measuring the electric pressure of a lightning flash.

After a series of startling tests on low and high voltages, and briefly finding the strength and direction of passing wireless waves, the Diviner connected himself to a lightning conductor. When the flash occurred, the assembled experts eagerly leaned forward to hear the verdict. At the inquest the Coroner touchingly commented on the fearlessness which characterises modern investigators.

In the course of his duty in Muggleton High Street, yesterday, a constable's suspicions were aroused by the arrival of a fierce-looking man with a portable electric generating set. This the man proceeded to set up on the pavement. He then placed a sheet of metal on one of the steps of No. 73 and ran a wire from it to the engine, which he started-up.

Upon the constable questioning him, he replied that he was going to take a film. The constable was satisfied, but remained nearby in the hope that he might appear on the film. Shortly afterwards the door of No. 73 opened, and a gentleman descended the steps. After a loud ejaculation of rage, the man with the engine collapsed in a fit. He was then given into custody.

It seems that the gentleman had recently dismissed the man from his employment, and the latter had, with fiendish cunning, planned to electrocute his former employer. Fortunately, the miscreant had been unaware that one of the intended victim's legs is of wood—this, of course, refusing to carry the deadly current.

Our Ketchem Correspondent writes:—During the week a number of trials with a startling new invention have been carried out here. The innovation takes the form of an original type of electric vehicle which will run at an efficiency of no less than 180 per cent. I have succeeded in gleaning a few details from the inventor. Naturally, he was a little reticent—the many patents which cover his invention not having yet been granted owing, as he tersely explained, "to the inertia of those red-tape Patent Office officials."

The car is similar to the ordinary light car, but no bonnet or wheels are visible. All the energy (electric) is generated under one of the seats, and the "magnetic repulsor" (which only weighs 10 lb., and yet develops up to 40 H.P.) is mounted at the car's centre of gravity, and by its effect on the earth currents can give speeds up to 140 M.P.H. Wireless switches are used for the various controls. As regards the source of current, the inventor would say nothing further than that he had "collared the electrons, and practically solved perpetual motion."

The inventor asserts with justifiable pride that his car will revolutionise the transport industry. As I left, the Screenit Co. was filming the modest inventor and his wonderful machine.

British Trade with Italy.—Mr. F. G. Kellaway, M.P., Parliamentary Secretary to the Department of Overseas Trade, is paying an official visit to the British Chamber of Commerce in Italy. He will be accompanied by Sir Frederick Butler, K.C.M.G., C.B., and Mr. T. D. Dunlop of that Department. He will attend the annual dinner of the British Chamber of Commerce for Italy at Genoa on May 15th, and will afterwards proceed to Rome, Milan, and Turin to study on the spot questions affecting British trade with Italy, and to inspect the work and equipment of His Majesty's commercial, diplomatic, and consular services in Italy.—*Financial Times.*

BUSINESS NOTES.

"Coming of Age."—Congratulations to the firm of Mann, Egerton & Co., Ltd., of Norwich, on its "Coming of Age." The business was founded in April, 1899, by the present chairman and managing director. Amongst the 1,200 employés of the company, over 50 have served the firm for periods exceeding 10 years; over 20 for periods exceeding 15 years; whilst four have served 21 years.

Football.—The Hartonians Athletic Football Club, which consists of the employés of the Hart Accumulator Co., Ltd., of Stratford, London, has just concluded a most successful football season, having won the Eastern Suburban League (Div. 2, Sec. A) Shield and Medals with the following record :—

Played.	Won.	Drawn.	Lost.	For.	Against.	Points.
20	16	1	3	58	18	33

Four friendly matches were also played, three of which were won, and the remaining game drawn, with a goal record of 18 "for" and two "against." The team has been well led by the captain (J. Smith), whose play at centre forward has been marked throughout the season with splendid consistency, he himself having scored on 32 occasions. Other good records were F. Drew, who scored 20 goals, and R. Killick, who netted on nine occasions. F. Drew has been a hardworking and painstaking hon. secretary, and he was also a capable inside left forward.

Aircraft Disposal.—The Aircraft Disposal Co., Ltd., who recently took over the whole of the surplus stock of aircraft material from H.M. Government, state that their sales department is now established at Regent House, Kingsway, London, W.C. 2, for the purpose of dealing with inquiries and orders for this stock, and from time to time offers for the disposal of the various materials will be circulated. Those interested in any particular class of material should communicate immediately, when special attention will be given to their requirements. With regard to aeroplanes and engines, it is the intention of the company to maintain a fixed price list, quoting definite prices from which a rebate will be quoted to all British aircraft manufacturers, British merchants, and firms dealing in aircraft accessories and components.

Standards in Sweden.—The Swedish Electrical Standardising Committee has issued a proposal for the adoption of the Edison screw for lampholders and sockets. It is based upon the standard adopted in France. Hitherto German standards have been exclusively used in Sweden.

Graphite Electrode Production in Norway.—The directors of the Norske Elektrodeverker A.S., of Christiania, in the course of an invitation for subscriptions to an issue of preference shares, so as to provide the means for extending the number of producing furnaces, state that the company has succeeded in turning out graphite electrodes which are equal to the best American products, and the first electrodes made have been tested with very satisfactory results at a thermo-electric installation. The prospects of business are considered to be very favourable, as besides Scandinavia, the company will have a big market in practically the whole of Europe. In particular the English market, the directors remark, is open for a quantity greater than the company's present production, and on the investigation which the board recently made in England, "it was shown that a Norwegian product will be received with great goodwill."

New Engineering Union.—The new Amalgamated Engineering Union, embracing the A.S.E. and 10 other societies connected with the engineering trades, will be formally constituted on July 1st. Its membership will not be far short of 500,000, and the funds are estimated at nearly £4,000,000. The programme of the new Union is not yet complete, but its first energies will be devoted to increasing wages. The present proposal is that the Union should demand a minimum for skilled engineers of £6 10s. per week. The present average weekly wage of the members is asserted to be between £4 10s. and £5 10s.—*The Times.*

The B.E.D.A.—Among the latest publications of the British Electrical Development Association is a booklet detailing the aims and objects of the society. A list is given of the members of the council and executive committee, and the methods of publicity are fully described, examples of B.E.D.A.'s pamphlets being illustrated. A report of activities is included, setting out the various ways in which public attention has been attracted to the benefits of "doing it electrically." At the end of the booklet a form of application for full particulars of the scheme is inserted. We have also received a reprint of an article entitled "Housing Construction and Electricity Supply," which, originally published by *The World's Work*, is being circulated by the Association.

The Employment of Demobilised Men.—The Rotary Club is trying to place in employment the thousands of demobbed men unable to find work. They are unearthing some valuable men, and employers needing labour could not do better than send particulars to the "Jobs for Demobbed Committee," "Rotary Room," Horrex's Hotel, Norfolk Street, Strand, W.C. 2.

Plant for Disposal.—York City Electricity Department invites offers for two 360-H.P. Willans high-speed engines direct-coupled to 460-500-volt Crompton generators, and two 50-H.P. 460-volt E.C.C. motors. For particulars see this issue.

"Safety First."—The pioneer of the "Safety First" movement, which has gained so much ground and had such excellent results in the U.S.A., the National Safety Council has sent us a booklet dealing with its formation, methods of publicity, &c. It is illustrated by reproductions of a few of the many posters published by the Council, which are very compelling, and of definite local interest. The Society claims a great reduction of accidents to workpeople as the result of its propaganda, and, from the figures given, this would seem to be amply justified. We have also received a copy of the "National Safety News," published weekly by the organisation, as well as an application form for membership. It is of interest to note that the British Government has applied for 23 memberships of the Council for the Chief Inspectors of Mines and Factories and for Superintending Inspectors of Factories in London, Manchester, Birmingham, Glasgow, Leeds, and elsewhere.

The E.P.E.A. and the E.T.U. at Port Sunlight.—The strike of Electrical Trades Union men at Messrs. Lever Bros'. works at Port Sunlight, owing to the employment of men in the Electrical Power Engineers' Association, has resulted in a temporary agreement being reached between the two organisations, the terms of which are as follows :—

A. That the E.P.E.A. circular dated February 24th, 1919, be publicly withdrawn through the Electrical Review.

B. That the question of the *bona fides* of the E.P.E.A. as a recognised Trade Union be temporarily dealt with by the Liverpool or Birkenhead Trades Council whose decision shall be without prejudice to any final proceedings before, and shall not be submitted as evidence to, the Trade Union Congress.

C. As an alternative to Clause B the E.T.U. suggest a temporary working agreement to be restricted to Lever's on the following lines :—That the members of the E.P.E.A. employed at Lever Bros. shall in all matters connected with the firm, act in conformity in every way with the decisions of the Electrical Trades Union, Mersey District Committee, pending a joint meeting of the two executives on May 28th, 1920.

D. That where under Clause C matters affecting the position of the members of the E.P.E.A. are to be considered by the Mersey District Committee of the Electrical Trades Union, three representatives of the E.P.E.A. shall be co-opted on such Committee with full voting powers.

E. That in any case where members of the Electrical Trades Union are in dispute at Messrs. Lever Bros., members of the E.P.E.A. undertake not to do anything calculated to defeat the objects of such dispute. Further, that the E.P.E.A. are prepared to convey this in writing to Lever Bros.

The foregoing shall be a temporary agreement, and shall be valid pending the meeting of the two executives, and shall be without prejudice to the position of either one society or the other.

The E.P.E.A. representatives indicated that they preferred to adopt Clauses C and D, instead of Clause B.

Both parties agreed to recommend these proposals to their members for acceptance.

Book Notices.—Scientific Paper No. 371 of the U.S. Bureau of Standards, "A New Cadmium-Vapour Arc Lamp" (6 pp.). Washington : Government Printing Office. Price 5 cents.—This paper deals with a new method of producing a cadmium vapour arc of great brilliancy. Since gallium has a boiling point above 1,500° C., the vapour pressure relation existing between cadmium and mercury is reversed when compared with cadmium and gallium. The cadmium, therefore, acts as the energy carrier when used in combination with gallium in a quartz lamp.

"*Journal* of the Institution of Electrical Engineers." Vol. LVIII, No. 290. April, 1920. London : E. & F. N. Spon, Ltd. Price 10s. 6d.—This issue contains the following paper :—"Eddy Currents in Stator Windings"; also, the annual accounts for 1919, and the Report of the Council for 1919-20.

"*Proceedings* of the Physical Society of London." Vol. XXXII, Part 3 (73 pp.). London : Fleetway Press. 4s. net.—Includes papers on "Testing Magnet Steel," by N. W. McLachlan, D.Sc. (Eng.), and "Forces on Heated Metal Strips," by Gilbert D. West, M.Sc. (Lond.).

"Woodland Notes." (39 pp.).—This well-produced and illustrated magazine is described as "a brief account of Fuller's United Electric Works, Ltd. The social activities of the employés, those they work with, where they work, and what they make," and the object is very well accomplished in this publication, which may be obtained by any member of the electrical industry from Messrs. Fuller's.

"Rotary Converters : Their Design, Construction and Use." By C. Sylvester. Pp. 59; 26 figs. London : S. Rentell & Co., Ltd. Price 2s. net.

"Electric Oscillations and Electric Waves." By G. W. Pierce. Pp. ix + 517; figs. 133. London : Hill Publishing Co., Ltd. Price 30s. net.

"Year Book of Wireless Telegraphy and Telephony, 1920." London : Wireless Press, Ltd. Price 10s. 6d. net.

The issue of *Conquest* for May contains an article by K. Robertson on "Power from Waste," explaining how the waste gases from blast furnaces are used for generating electricity, in addition to heating the blast. Prof. Sir Chunder Bose's remarkable work on plant life, and his magnetic crescograph, are described by K. K. Chatterjee, and there is a variety of extremely interesting articles on other subjects related to science.

Brazil. — STEEL WORKS AND ELECTRIFICATION IN MINAS GERAES.—A telegram from Rio de Janeiro dated April 27th, received by the *Times* through the *Agencia Americana*, states that the terms of the contract between the Government and the Itabira Iron Ore Co. have been published. They provide for the construction of high power coke furnaces for the production of steel with a guaranteed minimum production of 150,000 tons of steel sheets, ingots, &c. This telegram is of particular interest when read in connection with the report which has been made by the American Commercial Attaché at Rio de Janeiro of the arrival in Brazil at the beginning of the year of representatives of a syndicate to reorganise and electrify the Victoria Minas Railway from the port of Victoria, State of Espirito Santo, to the mineral section of the State of Minas Geraes. The State of Minas Geraes has always contended that its immense iron deposits should be utilised to the fullest advantage of the State, and therefore has maintained a somewhat indifferent attitude toward any proposals regarding the exportation of iron and manganese ores. In fact, one of the greatest handicaps to the exportation of the latter has been the heavy taxes imposed by the State; the inadequacy of transportation facilities has likewise been a drawback. It is understood that the syndicate proposes first to extend its railway to the mineral region, to install works for reducing sufficient ore to meet the iron and steel requirements of the country, and to develop the mines and transportation facilities to permit the exportation of ore in large quantities. Steamers carrying the ore will return loaded with coke and combustibles for the local mills, as it is evidently the opinion of the syndicate's engineers that domestic coal cannot be used because of the large percentage of ash—over 30 per cent. Electrical furnaces, too, though used to some extent in converting iron to steel, have not been found economical for the reduction of ore to iron. One of the problems involved in this study of the exportation of Minas Geraes ore is the distance of the deposit from the coast, some 550 kilometres (342 miles); whereas deposits found in Spain, Sweden, or northern Africa, whence British supplies are at present taken, are only 180 to 200 kilometres distant. In order to overcome this difference the syndicate intends to improve the Victoria Minas Railway by reducing the grades and lessening the curves. A second problem, that of obtaining return freight for the ore shipped, might well be solved by bringing back coke and fuel for the national industries. One of the technical directors engaged to install the proposed steel plant recently arrived on the ground for studying the problem with a view to selecting the best site for the plant.

Association of German Industries.—The German Press has paid considerable attention of late to the formation of the above association, particulars of which are forwarded to the Department of Overseas Trade by the British Commercial Commissioner in Cologne. The association was formed in 1919, and has as its purpose the representation and development of the German industries and the determination of uniform policy of each separate trade and common action in dealing with labour questions. The association has a council and directorate, the latter consisting of at least 30 and not more than 60 members, who either occupy or have occupied a leading position in an industrial undertaking, or have held a position on a board of directorate. The council is empowered to nominate a further 10 members to the directorate. The council, consisting of 7 to 15 members, is elected from the members of the directorate. The chairman of the council is Dr. Ingenieur Kurt Sorge, Berlin; first representative of the chairman is Abraham Frowein, Elberfeld; second representative of the chairman is C. F. v. Siemens, Berlin-Siemensstadt; managing director, Privy-Councillor Dr. W. Simons. A Main Committee is nominated, states the *Deutsche Bergwerks Zeitung*, and consists of representatives of each of the 25 industrial branches into which the association is graded. The total number of representatives is 140, distributed as follows:—

Mining 15, iron producing 10, metal works and metal semi-products 8, machines 5, railway wagons 2, hardware 4, iron and steel goods 5, electrotechnical precision instruments and optics 3, boilers and fittings 2, automobile and bicycles 3, timber 5, leather and leather manufactures 4, stone and earth 6, building 3, pottery 3, glass 4, chemical 10, oils and fats 3, paper 8, textiles 23, clothing 3, breweries and flour and malt mills 3, sugar and foodstuffs 4, provisions 3, shipping and transport 3.

In addition to the 140 members of the industrial groups the Main Committee is further composed of 10 representatives of agricultural associations, 10 representatives of home industries elected by members meeting at the suggestion of the directorate, and 10 representatives of members of the association nominated at the suggestion of the directorate. The Main Committee nominates special committees, and elects from year to year a Committee of Investigation. The following special committees have been formed:—

(1) Committee for the carrying out of the Articles of the Treaty of Peace.
(2) Tax Committee.
(3) Economic Committee.
(4) Social-political Committee.
(5) Press Committee.
(6) Committee of Investigation.

Mutual Discussion.—For the first time since its inauguration in 1916, the National Alliance of Employers and Employed is holding its annual meeting in the provinces. Hitherto, members of the Alliance have met in London, but this year it was decided that, in view of the important Joint Committees of employers and Trade Unionists which the organisation has established in many important provincial centres, the Annual Conference should take place on June 1st in a great industrial area. For this reason, Birmingham, the headquarters of the West Midland Federation of the National Alliance, has been chosen. Extremists in Labour ranks, reactionaries among employers, believe in the policy of force. The Alliance stands for forbearance, and the work it has accomplished is an assurance that steadily increasing numbers of employers on one side, and representatives of organised Labour on the other, are massing themselves with this movement, and striving for agreement over industrial problems—with goodwill. The National Alliance takes a grave view of the present spirit of unrest manifested in every section of the community. The price of commodities still increases, and with every rise in wages there is a corresponding increase in the cost of living. Labour blames Capital, and Capital blames Labour, but there is no whole-hearted effort on the part of either side to grapple with the problem in that spirit of unity which won us the war. The National Alliance claims to be the only organisation which can provide the machinery for a round table conference of employers and employed *of all trades*, who can discuss dispassionately the vital problems which touch intimately their very lives, and strike at the root of the trouble. In the great industrial centres where Alliance Committees are established, problems such as housing have been profitably discussed by local employers and Trade Unionists, and at such discussions the barriers of mutual suspicion and recrimination between Capital and Labour have been broken down.

Trade Announcements.—THE BENJAMIN ELECTRIC, LTD., of Tottenham, have been appointed sole selling agents by the Moto-Meter Co., Inc., for the Boyce Moto-Meter device, intended for use on motor cars, which indicates the temperature of the water in the radiator, thus notifying the driver of any undue overheating 15-20 minutes before he would otherwise be aware of the fact by engine trouble.

MR. J. HARRISON announces that he is continuing the business of MESSRS. HARRISON & WYLDE, electrical engineers, of Rotherham, under the style of Harrison & Co.

THE JACKSON ELECTRIC STOVE CO., LTD., are removing to 143, Sloane Street, London, S.W.

In order to cope with the increased business of their Cardiff branch, the BRITISH THOMSON-HOUSTON CO. have acquired, and now occupy, much larger premises at 7, Park Place, Cardiff, a few doors from the old address. Telephone number as before:—"Cardiff 4392." At the new office considerably larger stocks will be held, especially of the company's many forms of lighting appliances.

Catalogues and Lists.—THE DELTA ELECTRICAL CO., Temple Courts, Temple Row, Birmingham.—Pamphlet No. 100, illustrating and describing a new patent dolly-operated watertight tumbler switch.

BUILDING PRODUCTS, LTD., Columbia House, 44-46, King's Road, Sloane Square, S.W. 3. A leaflet illustrating the "Benquic" bar-bending machine for steel rod of any section, up to 1¼ in. diameter circular.

AUTOMATIC AND ELECTRIC FURNACES, LTD., 281-283, Gray's Inn Road, W.C. 1.—"Heat Treatment Bulletin" No. 21, describing the construction and advantages of Wild-Barfield patent electric furnaces. Includes a photograph of a typical radiation furnace installation.

MESSRS. SIEMENS BROS. & CO., LTD., Palace Place Mansions, Kensington Court, W. 8.—Pamphlet S 535 (15 pp.) giving a fully illustrated description of "Autophone" No. 2 automatic telephone system. The major portion of the pamphlet is devoted to a description of the ingenious switching apparatus and photographs of the component parts.

MESSRS. BROOKES, LTD., Lightcliffe Works, Halifax.—"Science, War and Commerce" (36 pp.), a booklet describing the firm's war-time activities; and "Dreams and Realities" (16 pp.), transcription of an interview with the managing director.

MESSRS. IMESON & FINCH, Empress Works, Stockton on-Tees.—A 12-page catalogue, illustrating and describing controllers, armature coils, brush-holders, trolley heads and wheels, commutators, fuse-holders, &c.

Italian Companies.—There has been formed in Milan a company styled Officine Elettromeccaniche Monteggia, with a capital of 1,600,000 lire.

At Montaldo has been launched the concern Segheria di Montaldo Dora, with a capital of 180,000 lire, for the dual purpose of sawmilling and the production and distribution of electrical energy.

The Società Anonima Radiotelegrafica Italiana has been established at Milan (Via Cavallotti 3), with a capital of 2,000,000 lire, for the manufacture of wireless telegraphic and telephonic apparatus.

With headquarters at Milan (Via Carlo Alberto 4) Zanni e Pirini have been incorporated as a company, with a capital of 150,000 lire, to conduct an electro-galvanoplastic laboratory.

Allocchio, Bacchini e Ca. have been formed into a company at Milan (Via Rasori 14), with a capital of 400,000 lire, for the manufacture of electrical measuring apparatus.

Electrical Wages at Liverpool.—The Mersey District Committee have given three months' advance notice of an application for an advance in wages from 2s. 1½d. per hour to 2s. 6d. per hour for all electricians employed in the Liverpool area. Application is also being made for a 10s. advance for youths over 18 years, and 5s. a week for those under.

Bankruptcy Proceedings.—ALBERT EDWARD CHANNON, HUMPHREY STANTON NADIN, and CYRIL GEORGE CHANNON (trading as A. E. Channon & Co.), electrical engineers, 8, Orrisdale Terrace, and 425, High Street, Cheltenham, Gloucestershire.—In this matter the receiving order was made on April 26th, 1920, on the debtors' petition. The liabilities in the partnership statement of affairs amount to £1,363, and the assets to £387. The separate liabilities of Albert Edward Channon amount to £22, and assets £25, thus showing a surplus of his separate estate of £3. The liabilities of the debtor Nadin amount to £8 15s. 6d., and he has no assets. The separate statement of C. G. Channon show liabilities amounting to £4 10s. 6d., and he also has no assets. The causes of failure alleged by the debtors are want of capital, losses on contracts, pressure by creditors, and ill-health of A. E. and C. G. Channon. The debtors were adjudged bankrupt on the same date as the receiving order was made. An execution was levied on February 8th last, and the debt and costs, amounting to £97, were paid. Two creditors have issued writs for sums amounting to £103, and there are several small judgments outstanding. The debtors, who are father, son-in-law, and son, state that they commenced business as electrical engineers at 425, High Street, Cheltenham, on January 1st, 1912. Their joint capital did not exceed £10, but stock-in-trade to the value of £200 was then obtained on credit. The books of account kept were sold ledger, day, invoice, order, and estimate books. The debtors further state that they took stock in February last, and, according to a statement given to one of the creditors, at that time they valued the assets at £647, and estimated the liabilities at £613. Having regard to the debts now scheduled in the statement of affairs, it would appear that the liabilities must have been greatly under-estimated. The debtors state that they became aware of their position in February last, and they have since contracted debts in the expectation of being able to retrieve their position. The unsecured liabilities on the separate estates of the debtors are for domestic debts. The following are creditors :—

Baxendale & Co.	£94	Metallic Electric Co., Ltd. ..	£12
Braulik, G.	44	Olivant	39
Bill & Berry	25	Simplex Conduits, Ltd.	45
Callender's Cable Co., Ltd. ..	25	Simpson, Baker & Co.	113
Drake & Gorham, Ltd.	123	Sharp, Fisher, Ltd.	502
Elco Manufacturing Co. (Bristol)	54	Fisher, John, & Sons	12
Export Loose Letter Sign Co. ..	11	Separate estate of A. E. Channon:	
Ediswan Co., Ltd.	58	The Cheltenham and Gloucester Building Society, Cheltenham (Sec. £350)	320
Falk, Stadelmann & Co., Ltd. ..	42		
Henley's, W. T., Ltd.	48		

The first meeting of creditors herein was fixed to be held on May 14th at the County Court Buildings, Cheltenham, but no creditors attended. The Official Receiver stated that he had received several proxies, one of which was a special proxy for £55, with directions that he should continue as trustee. There were, however, he stated, two points which would require investigation. One was in respect of the removal, by one of the largest creditors of goods, to the value of about £200, on 16th and 17th ult., and application had already been made for their return. The other point was with reference to the house and furniture. The affairs will remain in the hands of the Official Receiver.

LEWSLEY, J. W., electrician, lately trading at 103, Mansfield Road, Nottingham.—June 5th is the last day for the receipt of proofs for dividend. Trustee, Mr. E. W. Humphreys, 4 Castle Place, Park Street, Nottingham.

G. F. KIVEBON, electrical engineer, Sheffield.—First meeting. May 21st; public examination, June 10th; both at Sheffield.

Quain Electric Co., Ltd.—In the Companies Winding-Up Court on Tuesday, the petition of R. & A. Main, Ltd., of Gothic Works, Edmonton, for a compulsory order to wind-up Quain Electric Co., Ltd., came before Mr. Justice Astbury. Mr. Jolly, for the petitioners, said the petition had stood over for a fortnight in view of negotiations for a compromise. The only parties opposing the petition were the debenture-holders, and Mr. Bennett, who appeared for them, had agreed with him that the petition should be withdrawn without any order as to costs. Mr. Bennett: I agree. His Lordship allowed the petition to be withdrawn, without costs.

Capital Expansion of the German Siemens Co.—As a result of the great advance in the prices for raw materials and in wages, together with the reduction in the working shift, and the decreased efficiency of the workmen which have prolonged the time of manufacturing as compared with former years, the directors of the A.G. Siemens & Halske, of Berlin, have prepared a scheme for doubling the spare capital and making alterations in the company's statutes so as to prevent foreign interests from acquiring control over the undertaking. It is proposed to increase the present share capital of 63 millions of marks to 126 millions by the issue of new bearer shares for 63 millions, which are to be offered to existing shareholders at the price of 125 per cent., and to be entitled to participate in the dividend for 1920 for one-half of the year, and one new share can be subscribed for each existing share. It is recognised in Germany that the influence and co-operation of the Siemens family in connection with the company have answered the purpose during the course of decades, and it is now intended to convert a large number of the old shares into preference shares, with a manifold right of voting, namely, each preference share will be endowed with 30 votes. It is assumed that the raising of further capital in the future, and, if necessary, of obtaining capital from abroad will be facilitated in this way without losing the existing control and the German character of the undertaking. Thus, the ordinary shares ranging from No. 1 to 9,500, now held by the Siemens family, and representing a nominal amount of 9,500,000 marks, will be transformed into registered preference shares, and with the manifold voting power mentioned will be equal to 285 millions of marks.

The special voting power conferred upon the preference shares is only to be exercised in the case of decisions of vital importance, as, for instance, alterations in the company's statutes increases or decreases in the share capital, changes in the object of the undertaking, amalgamation or dissolution of the company, elections to the board of directors, and voting in regard to the dividends. On the other hand, limitations are to be imposed on the transfer of the preference shares. For instance, the transfer of shares to other persons is made dependent upon the sanction of the president of the Berlin Chamber of Commerce, and can only be granted if the prospective purchaser gives a guarantee that he will protect the rights of the company as German, and if he is a German residing permanently in Germany or in German Austria. It is also intended to modify the statutes so that the majority of the directors must be Germans. The directors believe that the scheme, without materially prejudicing the rights of the ordinary shareholders, will prevent the company from passing under foreign control. As bearing on this point it is mentioned that frequent inquiries from abroad have already been made for ordinary shares in the company. If the directors may think of taking advantage of those offers for the future financing of the company, they at the same time have considered it necessary already now to adopt the measures referred to, in order to obviate undesirable consequences.

It is assumed that a considerable portion of the proposed new capital is intended for the Siemens-Schuckert Works, either by way of an increased loan or additional ordinary capital. If this assumption should prove to be correct, there is no doubt that the other joint partner in the Siemens-Schuckert Works—the Schuckert Co., of Nuremberg—will have to undertake a new financial transaction if the respective capital investments in the Siemens-Schuckert Works are to remain on an equality.

The F.B.I. Abroad.—We have received a summary of the report prepared by Sir Charles Mandleberg on one year's achievements of the Federation of British Industries Commissioner Service. The following is a list of Commissioners and Representatives abroad :—

Place.	Name and address.	Status.
Near East ..	Major E. Kennard, Athens	Commissioner.
Greece ..	Capt. R. C. Cumberbatch, Athens ..	Sub-Commissioner.
Turkey ..	Capt. Lafontaine, Athens (temporarily)	Sub-Commissioner.
East Indies ..	Mr. G. O. Blacker, Singapore	Commissioner.
Spain	Col. C. Thoroton, C.M.G., Madrid ..	Commissioner.
Algiers	Mr. D. Thoroton, Algiers	Sub-Commissioner.
Brazil	Mr. P. J. McKellen, Rio de Janeiro ..	Commissioner.
Scandinavia ..	Mr. Montagu Villiers, Copenhagen ..	Commissioner.
Denmark ..	Mr. Paul Christensen, Copenhagen ..	Correspondent.
Australia ..	Mr. R. H. Butler, Melbourne	Correspondent.
Italy	Mr. E. H. Kapp, Milan	Representative.
Holland ..	Anglo-Dutch Committee, Amsterdam ..	Committee.
Canada	(1) Canadian Manufacturers' Association, Toronto.	Correspondents.
	(2) Canadian Association of British Manufacturers and their Representatives, Toronto.	Correspondents.
New Zealand ..	New Zealand Association of British Manufacturers and their Agents, Wellington.	Correspondents.

In addition to the foregoing, representation of a temporary nature was arranged during the period under review in Portugal and in the Occupied Area of Germany.

Arrangements have also been made for honorary Correspondents in the following countries :—Denmark, Finland, U.S., Cuba, Mexico, Egypt, France, China.

Applications for British Trade-Marks.—Appended is a summary of the recent applications for British trade-marks in respect of goods connected with the electrical industries and trades :—

Atmos. No. 393,544. Class 8. Electric lamps and galvanometers. No. 393,545. Class 13. Electric bells and fittings. No. 393,546. Class 18. Lighting contrivances and electric bell systems.—General Electric Co., Ltd., 67, Queen Victoria Street, London, E.C. July 23rd, 1919.

Solanti. No. 400,762. Class 39. Goods manufactured from india-rubber and gutta-percha.—India-rubber, Gutta-percha and Telegraph Works, Ltd., 106, Cannon Street, London, E.C.

Triangle (design). No. 399,244. Class 8. Resistance rods, coils, contact blocks and bearings, all parts of electrical apparatus.—The Morgan Crucible Co., Ltd., Church Road, Battersea, S.W. January 7th, 1920.

P.N. (design). No. 400,524. Class 13. Electric lamps.—The Pyle National Co., 1534, Kostner Avenue, Chicago. February 2nd, 1920.

Isco. No. 400,650. Class 13. Electric fittings.—W. T. Henley's Telegraph Works, Ltd., 13-14, Blomfield Street, London, E.C. February 11th, 1920.

Busy Bee. No. 396,862. Class 6. Electric motors and dynamos.—W. J. Allen & Wallace D. Vick, 73½, Coleshill Street, Birmingham. November 5th, 1919.

Bi-Spineflex. No. 401,312. Class 16. Electric insulators made of porcelain.—Taylor, Tunnicliff & Co., Ltd., Eastwood Works, Hanley. February 28th, 1920.

Majestic. No. 401,673. Class 13. Metal filament lamps, being ordinary electric lamps.—General Engineering Co. (Salford), Ltd., 74, Broad Street, Pendleton, Manchester. March 10th, 1920.

Morite. No. 400,239. Class 50. Electric insulators made of one of the phenol formaldehyde condensation products or syntheses of same.—Arthur S. Gush, 5, Clifton Terrace, Edinburgh. January 30th, 1920.

Blackcap-Ediswan (lettering combined with design). No. 400,164. Class 8. Electric lamps for philosophical purposes.—Edison Swan Electrical Co., Ltd., 123-5, Queen Victoria Street, London, E.C. January 29th, 1920.

Kalecore. No. 400,948. Class 8. Paper-insulated electric cables.—Callender's Cable and Construction Co., Ltd., Hamilton House, Victoria Embankment, London, E.C. February 19th, 1920.

Digitized by Google

French Company Notes.—Under the title of Le Téléphone Moderne, Société d'Installations Téléphoniques, a company has been formed at Paris (12, Rue du Port Mahon), with a capital of 150,000 fr., for the installation of telephones.

The Société Générale de Force et Lumière have raised their capital from 30,000,000 to 50,000,000 fr. Eventual increase to 75,000,000 fr. is also authorised.

The capital of Le Fil Dynamo is to be raised from 500,000 to 3,000,000 fr., for the building of a new works.

The Société Hydroélectrique du Verdon has raised its capital from 1,000,000 to 2,500,000 fr. in order to secure rights on falls on the upper Verdon River.

There has been formed at Paris (Rue de Londres 29), the company Lignes Télégraphiques et Téléphoniques, with a capital of 10,000,000 fr., for the planning, manufacture and working of all kinds of electric lines and cables. This company is a trust of French cable and wire makers, embracing all the important firms except the Société Alsacienne, Jeumont, and the Société Industrielle des Téléphones. On its board of management are representatives of the Thomson-Houston, the Tréfileries et Laminoirs du Hâvre, the Canalisation Electrique, the Berthoud-Boret, and the Matériel Téléphonique companies.

The Electrodes de la Savoie is the style of a company launched at Paris (2, Rue Blanche), with a capital of 2,000,000 fr., for the manufacture of electrodes.

The Société Française de Lamps à Incandescence "Luxor" (Floret et Cie.) has been constituted at Levallois-Perret, Seine (8, Rue des Frères Herbert), with a capital of 375,000 fr., for the manufacture of glow lamps.

The Etablissements André Dauphin has been formed into a company (14, Rue St. Claude, Paris) for the manufacture and trade in electric material. Its capital is 100,000 fr. in 100 fr. shares, 100 of which are allotted to the Société Dauphin et Cie. for assets taken over.

Under the style of the Ateliers de Construction et Installations Electromécaniques has been formed at Rouen (52, Rue St. André), a company with 200,000 fr. capital, for the objects shown in its title.

The Compagnie Electro-Industrielle has been constituted at Levallois, Seine (Rue Jean Jaurès 32), with a capital of 3,000,000 fr., for the manufacture and trade in electrical material of all kinds, including metal working and mechanical.

The Etablissements Métallurgiques Rhône-Isère has been established at Lyons with a capital of 1,000,000 fr., for the objects set out in its title.

The Auxiliaire Industriel is the style of a company established at Paris (5, Rue d'Athènes), with a capital of 600,000 fr., for the study, manufacture, sale, and representation of all kinds of electrical material.

With a capital of 200,000 fr., Le Matériel has been constituted a company at Paris (21, Rue d'Edimbourg), for the trade in and manufacture of electrical material for public works, especially hydraulic, mechanical, and heating.

Under the title of Le Moteur Electrique has been formed at Lyons (18, Route de Crémieux), a company for the manufacture, purchase, and sale of motors, dynamos, and transformers; also their erection and repair. The capital is 1,000,000 fr.

Annual Outing.—No doubt there will be quite a marked revival of the annual outing this year, notwithstanding the high cost of everything. The first of the season, so far as reports have reached us, is that of the London branch of Messrs. Malcolm & Allan, Ltd., electrical engineers and contractors. A party of just over a hundred, including ladies, went to Maidenhead and district by the steam-launch *Empress of India*, on Saturday, May 15th. The company boarded the launch at Windsor. Luncheon was served on board. The sports events were very successful; football, three-legged and other races, occupied so much time and created such interest that there was not time for the cricket match. On the return to Windsor a successful concert and dance were held. The prizes for the sports were distributed by Mrs. H. S. Davidson.

The E.T.B.I.: Local Commitees at Newcastle.—A meeting for the purpose of appointing a local Advisory Committee of the Electrical Trades' Benevolent Institution for Newcastle and District, was held at the Mining Institute, Newcastle-on-Tyne, on May 10th. Mr. W. C. Mountain, who presided, briefly explained the objects of the Institution, and said that the Committee of Management was in London, but he thought they should have a Local Advisory Committee in the North-Eastern Area, which was very naturally, from the Tyne to the Tees. Mr. Mountain said it would not be very long before the present fictitiously prosperous times would come to an end. He did not want to be pessimistic, but there was no doubt that we were in for bad times before we were very much older, and if they were ready to help those who were unable to get employment, and who possibly might fall into bad luck and in a position where this Institution could help them, they would be promoting a very good object. Mr Hawes, the secretary, then outlined the work of the Institution, and gave typical examples of cases that had come before the Institution for aid. After a number of questions had been asked and answered, Mr. Clothier proposed, Mr. Anns seconded, and it was unanimously resolved, to elect a Committee for the district. Mr. Mountain is the chairman of the Committee; Mr. T. W. Anns, honorary secretary; Mr. J. Gledson, honorary treasurer; and the following are on the Committee:—Messrs. W. F. T. Pinkney, Newcastle Electric Supply Co.; D. Patterson, Newcastle and District Electric Lighting Co.; W. Dalton, Newcastle Corporation Tramways; J. W. Dodds, Electric and General Stores Co., Ltd.; Alan Robson, Simplex Conduits, Ltd.; H. P. Devereux, Devereux Moodie & Co.; R. Robson, Robson & Coleman; H. Barkes, British Electrical and Manufacturing Co.; J. Spence, General Electric Co., Ltd.; W. Fletcher, Fletcher Bros.; Mr. Clothier, Reyrolle & Co.; Mr. Stephens Holmes, Messrs. J. H. Holmes & Co.; Mr. Raw, Mining Electrical Engineers; Mr. Wyand, Sir W. G. Armstrong, Whitworth & Co.; Mr. Thompson, Cleveland and Durham Electric Power Co.; Mr. Sloan, Newcastle Electric Supply Co.; and one nominee from each of the following: Messrs. Clarke, Chapman & Co.; Messrs. Sunderland Forge and Engineering Co.; Society of Technical Engineers; Electrical Power Engineers' Association.

Liquidations and Dissolutions.—GRATZ, LTD.—Winding up voluntarily for reconstruction purposes. Liquidator, Mr. E. V. Hayes-Gratze, Elidia, Woodstock Avenue, Hendon, N.W. 4.

HYDRO-ELECTRIC CONCESSIONS, LTD.—Winding up voluntarily. Liquidator, Mr. W. Gain, 3 and 4, Great Winchester Street, E.C. Meeting of creditors at 3 and 4, Great Winchester Street, E.C., May 25th. Claims to be sent to the liquidator forthwith.

BRITISH EVER-READY CO., LTD.—Winding up voluntarily for reconstruction purposes. Liquidator, Mr. W. T. Walker, 53, New Broad Street, E.C. Meeting of creditors at Hercules Place, Holloway, May 25th.

BRITISH ELECTRICAL ACCESSORIES, LTD.—Meeting of creditors at 3, Cheapside, Bradford, May 21st.

ELECTRICAL AND MECHANICAL TRADES SUPPLY, Russell Buildings, St. Mary Street, Swansea.—Mr. W. A. Roderick and Mr. R. Scott have dissolved partnership. Mr. W. A. Roderick will attend to debts and continue the business.

ECONOMIC ELECTRIC CO., automobile and electrical engineers, 63, Knutsford Road, Warrington.—Messrs. B. Nadin, W. Wright and P. J. Dell have dissolved partnership. Debts will be attended to by Messrs. B. Nadin and P. J. Dell, who will continue the business under the same style.

PARKER & PARKES, electric welders, &c., Union Street, Newport.—Mr. W. G. Parkes and Mr. R. S. Parker have dissolved partnership. Debts will be attended to by Mr. W. G. Parkes.

NORTHAMPTON PLATING CO., electro-metallurgists and enamellers, 71, St. Giles Street, Northampton.—Mr. W. F. White and Mr. E. H. Nichols have dissolved partnership. Debts will be attended to by Mr. E. H. Nichols, who will continue the business.

SIMMS MOTOR UNITS, LTD.—Winding up voluntarily, in view of the sale of the undertaking to a new company. Liquidator, Mr. D. R. Duncan, Percy Buildings, Gresse Street, Rathbone Place, W. 1. Meeting of creditors at Percy Buildings, May 27th.

SPANISH AND GENERAL WIRELESS TRUST, LTD.—Particulars of claims must be sent to the liquidator, Mr. S. Pears, 14, George Street, Mansion House, E.C., by June 22nd.

Socials.—The third of the Mazda House series of staff entertainments took place at Slater's Cannon Street Restaurant, on May 7th. At 6.30 p.m. the party of 100 sat down to progressive whist, and for upwards of 90 minutes played with relentless fervour for the prizes, which were distributed by Mr. F. Shaw, the chairman, at supper. During the meal a collection was taken for the waitresses, which, when counted, was found to include one farthing. It was returned to the only Scotsman in the room. After supper the company engaged in terpsichorean exercises, interspersed with songs rendered by various members of the B.T.H. staff.

Exeter Agricultural Show.—The Devon County Agricultural Association held their exhibition at Exeter during May 12th, 13th, and 14th. The exhibition generally was a huge success. On the electrical side were the following stands:—Austin Motor Co., Ltd., showing their 75-KW. autoplant; Studebaker, Ltd., Lalley light and power plants; R. A. Lister & Co., Ltd., Lister-Bruston plant; Brooking & Co. The last-named firm appeared to be the only electrical contracting and installation company exhibiting, with the result that they had a free run of inquiries, plus a very satisfactory order book, not only for their particular goods on show, but also for the goods shown by the manufacturers at the other stands. Brooking & Co. had on show the Madstrong set, also the Ingeco set by Worthington of pump fame. The Hoover vacuum cleaner was to be seen in operation, a special demonstrator being in attendance. A particular feature of the stand was the prominence given to Callender's Kaleeco wiring system, which is meeting with great success in the West of England. At their stand, Messrs. Wood & Ball represented the manufacturers with the idea of doing all that is possible to popularise the use of electricity in agriculture and like industries, and to render direct assistance to electrical contractors. They will be showing at Salisbury Show. Their various exhibits included the plants made by the New-Pelapone Engine Co., Ltd., of Leeds; St. Helens cab tires, C.T.S. cables and anti-corrosive fittings; lighting fittings, by Electrical Supplies Co.; electric self-starting switchboards, by Mr. T. Burgoyne, of Kingsbridge, Devon; batteries, by Pritchett and Gold and E.P. Storage Co., Ltd.; and motors, by Bruce Peebles and Co., of Edinburgh. We are informed that a particular feature of the Exeter Show was the mutual good feeling between the manufacturer and the contractor.

Important Armstrong-Whitworth Development.—It is announced that MESSRS. SIR W. G. ARMSTRONG, WHITWORTH AND CO., LTD., have entered into arrangements with an old-established Christiania firm of hydraulic engineers (Messrs. Jensen & Dahl), under which they will take up the manufacture in this country of water turbines to Jensen & Dahl designs. Messrs. Armstrong, Whitworth have opened a hydro-electric section at their offices at 8, Great Georgel Street, Westminster, S.W. Messrs. Jensen & Dahl have been responsible for many important Norwegian and other hydro-electric enterprises. The British company referred to has the exclusive rights for the British Empire and South America.

Digitized by Google

A New Electric Heater. — The efficiency of electric heaters is limited by the melting point of the heating units and the lack of intimate contact between the heating units and the material to be heated. If the heaters are laid inside the containing vessel, there is no material of which they can be constructed that will not be attacked by electrolysis when saline or other solutions are being heated. A new form of heater for A.C. circuits, described in *Electrotechnische Zeitschrift*, consists of a vessel provided with a vertical channel through its interior, through which the magnetic circuit of a transformer passes. The energy is supplied to a coil wound around the magnetic circuit, and the heat is generated in a metal cylindrical wall interlinked with the magnetic circuit and forming the side or bottom of the vessel and acting as a secondary circuit to the transformer. The efficiency of a vessel of this type is nearly unity.

Liverpool Exhibition.—An interesting feature of the Liverpool Health and Homes Exhibition held at St. George's Hall, was the useful display of domestic electrical contrivances, for lighting, motive power, heating, &c. The exhibition was visited by thousands of people, who paid special attention to such exhibits.

Patent Application.—On June 16th, Mr. Justice Sargent, in the Chancery Division, will hear the petition of the Reason Manufacturing Co., Ltd., of Brighton, for an extension of the term of Patent No. 20,500, of 1905, for "Improvements in mercury electrolytes for electrolytic cells," and of Patent No. 20,770, for "Improvements in cathodes," both granted to H. S. Hatfield and the Reason Manufacturing Co.. Ltd.

New Indian Companies.—Among the new companies recently formed in India are the Indian Enfield Cable Co., 4, Fairlie Place, Calcutta, capital 2,500,000 rupees, to manufacture and deal in electric wires, cables, &c.; and the Coal Fields Power Co., Calcutta, capital 1,500,000 rupees, to establish plant to generate electric energy for lighting and power purposes.

LIGHTING AND POWER NOTES.

Argentina. — COMPANY REPORT. — According to the recently-issued report of the Société d'Electricité de Rosario, the company is now supplying power to the extent of 25,230 KW. to 21,630 clients, as compared with 23,820 and 20,074 respectively a year ago. The output of the generating station during 1919 reached a total of 22,899,989 KW.-hours, an increase of 15 per cent. over 1918. The boilers at the generating station have been converted to use coal and petroleum as fuel in place of wood.

Australia. — MELBOURNE. — The recently-published abstract of the accounts of the City Electricity Supply undertaking, for the year ended December 31st last, shows that the total revenue amounted to £240,081, and the total expenditure to £134,854, leaving a gross balance of £105,227, apportioned as follows:—Interest on capital, &c., £23 885; depreciation and renewals account, £37,999; and appropriations, £43,343.

Ayr. — PROPOSED EXTENSIONS. — The Corporation is seeking authority from the Electricity Commissioners to install additional plant or build new works. An alternative scheme is to take a bulk supply from Kilmarnock.

Barnsley.—CHARGE FOR METERS.—The Electricity and Lighting Committee recommends that a rental of 1s. 6d. per quarter be charged on all electricity meters installed in premises the net rateable value of which exceeds £10, the rental to come into force as from June 1st.

EXTENSIONS APPROVED.—The Electricity Commissioners have sanctioned proposed extensions to the present electricity works. The Electricity Committee has received a report from the electrical engineer in connection with the progress of such extensions.

Blackpool.—FUTURE DEVELOPMENTS.—The Electricity Committee has authorised the electrical engineer to seek an interview with the Electricity Commissioners, to place before them the local position with regard to electricity generation and distribution, and to ascertain, if possible, their proposals for the future development of the electricity supply business on the West Coast. This followed the Committee's adoption of the recommendation to install additional boilers at the electricity works.

Bradford.—NEW CONDITION OF SUPPLY.—The Electricity Committee has announced that in future applicants for electricity must sign a special condition which provides that the Corporation reserves the right to suspend the supply if it is found necessary when the total demand for power exceeds the effective capacity of the plant at the works. The condition is the outcome of the difficulties which arose during the recent long breakdown period at the generating station.

Bury.—LOAN.—The Town Council is applying for permission to borrow £4,341 in order to carry out extensions to mains, services, and public lighting.

Burnley.—PROPOSED EXTENSIONS.—The demand for electric power for mills and workshops has increased to such an extent, that steps will shortly have to be taken to provide additional generating plant. The Town Council has been recommended to seek borrowing powers for £150,000 to provide this, although under the new scheme for the Mid-Lancashire area it is probable that at least two large generating stations will be erected at approved centres.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—An estimate of £3,400,000 has been submitted to the Ontario Legislature for the requirements this year of the provincial hydro-electric system, over £2,000,000 being for power development at Chippewa and Queenstown.—*The Times.*

Clacton-on-Sea. — PROPOSED PRICE INCREASE.—The Urban District Council has applied to the Electricity Commissioners for power to increase the price of electricity by not more than 50 per cent., to enable the undertaking to be run without loss. A new Diesel engine is to be installed at the works.

Continental.—FRANCE.—One of the greatest industrial regions in France is formed by the suburbs of Paris, where the Union d'Electricité has undertaken the task of providing a supply of light and power on terms favourable to the consumers. The company has already purchased the works of the suburban undertakers, and intends to retain as auxiliaries those which are able to work on an economical basis, whilst the others will be disposed of so as to redeem the purchase price. It has been decided to substitute for these old works a super-station with a total capacity of 200,000 KW., and equipped with steam turbo-alternator sets of from 35,000 to 40,000 KW., which sets will be, it is said, the largest in France down to the present time. The primary network will have a pressure of 60,000 volts, and it is expected that the company will be able to dispose of 500,000,000 KW.-hours on the completion of the station. The company's share capital was recently increased to 125,000,000 fr., and the issue of a loan of 80,000,000 is now in contemplation.

The new station which the Compagnie Hydroelectrique et du Gaz de Lyon has been building on the Gorges du Fier will shortly be working; it will have a capacity of 40,000 H.P.

The French Minister of Agriculture has just created an Upper Council of Water and Rural Engineering entrusted with the examination of all questions—technical, economic, financial, and judicial—relating to the development of water resources, control of water courses, and the application of electricity to agriculture. It is divided into three sections—water, rural engineering, legislation, and litigation.

SWEDEN.—Great strides have been made in Sweden in late years in the use of electricity in agriculture. Three great hydro-electric installations exist, which place at the disposal of farmers a considerable amount of energy. One of these is situated near Trollhattan, a second is near Hjemsjö, and the third belongs to the Southern Sweden Electric Co. The energy, in the first of the above installations, is transmitted to sub-stations, where the pressure is stepped down from 70,000 to 20,000 volts; to these sub-stations are linked others, which supply at from 1,500 to 3,000 volts, available for use within a radius of three or four miles, the subscribers themselves forming a distributing company and providing the capital for the construction of their own local network. The State gives help to companies of this kind by means of loans on favourable terms. The distributing companies unite together into district or central companies, with their own appointed engineers, who carry out inspections and schemes of improvement, and, on demand, give advice. The largest of these companies buys its own materials, at a considerable saving of expense and with the best guarantee of the type and quality of the purchases. The electric energy serves the most varied uses and operations; besides lighting, it is used to drive threshing machines, straw-presses, winnowers, straw-cutters, forage-cutters, lifts, cheese-churns, milkers, &c.—*Bolletino d'Informazioni Agrari.*

Among the new companies recently formed in Sweden, in connection with the utilisation of water-power in the generation and distribution of electrical energy are the Nasums Elektriska Kraft Aktiebolag, organised at Osby, and the Vikbolandets Elektriska Aktiebolag, formed at Norrkoping.

SWITZERLAND.—The recently issued report of the North-East Swiss Power Works Co. gives interesting information regarding the large new stations for which a general meeting is being asked to sanction an outlay of 114,000,000 fr. In the year 1916-17 the output totalled 149,000,000 KW.-hours; in 1918-19 it rose to 222,000,000 KW.-hours; for 1924-5 the requirements will reach 346,000,000 KW.-hours, which cannot be supplied by the existing stations at Beznau, Löntsch and Eglisau, the last-named only completed this spring, as their total output only amounts to 186,000,000 KW. for 3,000 hours. The deficiency cannot be met permanently by resort to outside supplies, which are both increasingly difficult to procure and ever rising in cost. Hence the company is planning the building of three new power stations, namely, the Etzelwerk, the Wäggitalwerk and a station on the Aare, near Gippingen. The first-named station will be built near Megglen, on the Sihl River, and will have a capacity of 70,000 KW. and a yearly output of 135,000,000 KW.-hours. Its estimated cost, 2·5 fold the outlay before the war, is 94,000,000 fr. The second-named station will be built at Siebnen, on the Wäggital River, and will have a capacity of 60,000 KW., and a yearly output of 80,000,000 KW.-hours. Its cost is estimated at 60,000,000 fr. The third station will be situated on the Aare, near Koblenz, and will have a capacity of 30,000 KW., and its output will bring the

Digitized by Google

aggregate up to 260,000,000 KW.-hours. The estimated cost of this station is 65,000,000 fr. To defray the outlay on these several stations to the extent of 114,000,000 fr., shares to the amount of 34,000,000 fr. will be created, and 80,000,000 fr. of bonds issued, raising the capital of the company to 70,000,000 fr., and the bond indebtedness to 105,000,000 fr. Cantons interested in the undertaking will take up the new shares in the following ratio :– Zurich, 42 per cent.; Argau, 32 ; Thurgau, 14 ; Schaffhausen, 9 ; Glarus, 2 ; and Zug, 1 per cent.

BAVARIA.—A new limited liability company is being floated in Mellrichstadt, whose object is the construction of a long-distance power transmission station for the uniform supply of the Rhön, Dernbac, Mellrichstadt, Königshofen, and Meiningen districts. The electricity works in each district are to be affiliated to the new company. To meet the excess costs of construction, the communes are paying a subsidy—amounting to 100 marks per head of the population—which is non-redeemable, and carries no interest.—*Economic Review.*

TURKEY.—La Société Ottomane d'Electricitè, of Constantinople, has recently secured from the Turkish Government an extension of 33 years of its concession, the Government's right of purchase having also been delayed until 1943. The number of clients of the company increased during the past year from 12,137 to 12,894 ; the output of the generating station during the past year amounted to 25,696,500 KW.-hours, as against 28,111.150 KW.-hours in 1913.

ITALY.—In order to meet the increasing demand for electricity, the Società Bolognese di Elettricità has decided to considerably enlarge its steam-operated generating plant, no further available water power for the hydro-electric station being available.

Deal and Walmer.—TIME EXTENSION.—The Minister of Transport has extended, to September 30th, the time under the Deal and Walmer Gas and Electricity Act for the extension of mains.

Douglas (Isle of Man).—ELECTRICITY SUPPLY.—The Douglas Electric Light and Power Co., Ltd., and the Town Council have asked leave from the Tynwald Court to introduce Bills for the supply of electricity in the borough, and a committee has been deputed to recommend that the petition be granted.

East Ham.—LINKING UP.—Writing to the Corporation, the secretary of the Electricity Commission says :—

"Applications for the extension of generating plant have been received from the local authorities of East Ham, Barking and Ilford respectively, and the Electricity Commissioners are of opinion that it is inexpedient and contrary to the public interest that any further extensions of generating plant should be made at the above-named three places.

"A Conference of the Electrical Engineers of the three boroughs and districts and also of the Borough of West Ham was, therefore, summoned, and the engineers were invited by the Commissioners to state their views, it being understood that the Conference was to be without prejudice to the interests of any of the Councils whose engineers were present.

"As a result of this Conference, and at the request of the Commissioners, the engineers have inquired into the matter very fully in order to ascertain the further demands that are likely to arise in each district during the next three or four years, and an estimate of the cost of laying a transmission line to interconnect these three districts and the West Ham electricity undertaking has been prepared.

"A comparison of the cost of energy in each district if the further supply required be taken wholly from West Ham, with the cost of generation from an extended local station, shows that East Ham, Barking and Ilford would all benefit by such an arrangement.

"For the immediate additional supply of Barking and East Ham, the Ilford Council's station, now being extended and approaching completion, would be available, that is, for next winter's load, and afterwards the West Ham undertaking would find a further increase required."

Exeter.—NEW PLANT.—The Town Council has applied to the Commissioners for consent to install an additional turbo-alternator of 1,000 to 1,500 KW. capacity, for the winter load of 1921, at a cost of from £22,057 to £30,426.

EMPLOYES' WAGES.—The City Council, at a recent meeting, decided to adopt the award to electrical workers of the National Joint Industrial Council. A proposal to disregard this and withdraw from the Board was defeated.

Holmfirth.—PRICE INCREASE.—The price of electricity has been advanced to 9d. per unit on account of the continued increases in the prices of materials.

Hove.—BULK SUPPLY.—The Town Council has decided to adopt the Brighton Corporation's terms for a bulk supply. This is being taken as an alternative to extending the Hove plant, which has become out of date.

Iceland.—WATER POWER.—The exploitation of Iceland's waterfalls is a matter of great importance. The latent power is estimated at 1,000 million H.P., but has been very little utilised. The Icelandic Waterfall Commission is at present considering the granting of a concession to a Danish-Norwegian company which wishes to exploit some of the falls. It is intended to use the power for the manufacture of nitrogen, and for an extensive scheme of electrification. Among other schemes is one for the construction of a 200-km. electric railway, running from Reykjavik, east and south through the agricultural district, which, if carried out, would be Iceland's first railway.—*Economic Review.*

Leeds.—STRIKE.—About 200 labourers employed by the Electricity Department in laying cables, struck work because they had not been brought within the scope of the wages award as applied to the engineering and allied trades. The Corporation refused to negotiate on the matter till the men resumed work. The men decided to go back to work on May 11th, and negotiations were at once begun. The strikers are also claiming £5 per week, alleged arrears in wages since December 1st last.

Midlands.—JOINT ELECTRICITY AUTHORITY.—It is understood that it is proposed to form a joint electricity authority to include Stafford, Wolverhampton, Walsall, Wednesbury, West Bromwich, and the area covered by the Midland Electric Corporation, but eventually the authority will be extended to bring in also the Potteries and Shrewsbury. The inclusion is also suggested of a portion of the County of Cheshire, so that Crewe and Nantwich can be supplied from the proposed power station at Stoke. The area as outlined will comprise 2,100 sq. miles. It is considered that sites at Rugeley on the Trent, and Ironbridge on the Severn, offer the best facilities for the necessary supplies of water and fuel. At the former place an area of 45 acres can be obtained, sufficient to provide for a station of over 200,000-KW. capacity. The river will give condensing water by direct circulation for 75,000 KW. at a minimum, but by means of a dam the working capacity can be raised to 125,000 KW., or even higher. The station at Rugeley will be limited by the quantity of water available for condensing purposes, and the proposal is that the plant shall not be of a greater capacity than 60,000 KW. The covering of this wide area with a network of supply mains, it is considered, will create a bigger demand for electricity for many purposes, industrial and domestic. The total plant capacity of existing stations is something under 100,000 KW. The first portion of the new scheme to supplement, and in some cases to supplant, present sources of supply, is the erection of the new station at Stoke, the suggested capacity being at the outset 20,000 KW. produced by four turbo-alternators. The first section of the new station at Rugeley will also be undertaken, its initial capacity to be 30,000 KW. As these stations come into commission all plants other than those of the three-phase 50-cycle turbine type will be closed down. The capacity of the Stoke and Rugeley stations will be extended in accord with the demand, and not until they have fully developed will the Ironbridge station be built. In the initial stages the capital expenditure will probably be between three and four millions, but the cost of the completed scheme will be approximately 15 millions.

Stafford.—YEAR'S WORKING.—The annual report of the municipal electricity undertaking shows that after debiting loan charges and income-tax, and crediting dividends and rents, the result of the working for the year ended March 31st, 1920, was a net deficit of £302, which added to that of £562 brought forward, made a total deficit of £864. The sum of £1,000 out of the gross profits of £3,818 had been placed to the depreciation fund. For the year ending March last, the total sales amounted to 1,999,200 B. of T. units, as compared with 731,800 units for the 12 months ending March, 1913.

TRAMWAY AND RAILWAY NOTES.

Burton-on-Trent. — YEAR'S WORKING. — The tramway manager's recently-presented report states that, unless fares are substantially increased or a subsidy is granted from the rates, the undertaking will show a loss of £11,700 on the coming year. The chairman of the Tramways Committee states that the deficiency on the past year's working was £3,294, without the transfer of anything to the depreciation and renewals funds. A suggestion to substitute motor-omnibuses for the tramways met with no support owing to the initial cost and greater running expenses.

Canada.—RAILWAY ELECTRIFICATION.—One of the first sections likely to be converted to electrical operation in the proposed electrification of Canadian trunk lines will be the double-track line of the Grand Trunk Railway between Toronto, Hamilton, and Niagara Falls, a distance of 82 miles, says the *Electrical News*. The coal shortage has been very threatening for several seasons, making it urgently necessary to reduce the coal bill just as soon as the required additional electric power is available. Very important undertakings are now in hand, and well advanced for the supply of electric power. High-voltage D.C. operation is now beyond the experimental stage, and firmly established on other trunk lines, offering increased capacity and economy in operation beyond the most optimistic views of 10 years ago. The electrification of Toronto terminals, covering 15 miles, will require much study to overcome the many difficulties likely to be met with, following with the Hamilton terminals, a length of five miles. With these two terminals converted, the trunk lines connecting could be electrified early, including also the Niagara Falls terminal of two miles.

Continental.—ITALY.—In order to meet the excessive cost of coal for steam-raising purposes, the Société des Tramways de Turin proposes to electrify the branch provincial lines at

Digitized by Google

present worked by steam. In connection with the scheme an application has been made to the Italian Government for an annual subvention.

Sweden.—Railway Electrification.—The Swedish Committee of State has approved the Government proposal for the allotment in 1921 of a first instalment of 23,000,000 kroner in connection with the projected conversion of the State railway between Stockholm and Gothenberg to electric traction. The Committee expresses the expectation that the railway and hydro-electric administrations will co-operate in solving the question of the methods of transmitting power from the power network to the railway system.

East Ham.—New Equipment.—The Town Council has applied for a loan of £8,331 for 10 new sets of equipment for reconstructed tramcars.

Ilford.—Electric Vehicles.—An unopposed inquiry was held on May 13th into the application of the Urban District Council for a loan of £8,050 for the purchase of six electric vehicles for the collection of house refuse.

Liverpool.—Derailment.—Owing to a train being derailed on the electrified part of the L. & Y. Railway between Liverpool and Southport on May 14th, several hundreds of city workers were unable to get home until late in the evening.

Electric Vehicles.—An order for the supply of certain electric vehicles has been cancelled by the Liverpool Health Committee, and the city engineer has been instructed to make fresh inquiries.

London.—Railwaymen's Wages.—The Industrial Court, in an award governing the wages of employés in power and sub-stations and electrical grades on railways in the London district, issued on May 11th, gives an advance in time or day rates of 6s. per full ordinary week, or 1½d. per hour, according to the custom of payment on the various railways. The advance applies to male workers of 21 years and over who are in receipt of a war wage of 33s. 6d. per week and a bonus of 12½ per cent. on earnings. Half of the advance will be retrospective to March 31st, and the remainder payable on May 31st. The case of the workers was put to the Court by the Electrical Trades Union, which claimed an advance of 15s. per week for those of 18 years of age and over, and 10s. for apprentices and boys under 18. Where the practice before the war was to pay those under 21 years of age who were in receipt of the full rate for labourers the same advances as were granted to those over 21, the Court decided that that practice should be continued. A claim by the N.U.R. for an advance of 15s. per week for all men and women in the railway shops and 7s. 6d. for boys and girls, including all those employed in electric generating stations on railways in the United Kingdom, has also been decided by the Industrial Court, which held that the workers who were in receipt of a war wage of 33s. 6d. a week and the bonus of 12½ per cent. on earnings should receive the advances granted on March 23rd to workers in railway shops. The general alteration then made was similar to that reported above for electrical grades.—*The Times.*

Underground Fares.—The Bill promoted by the London Electric Railways seeking powers to increase the maximum fares came before a Select Committee of the House of Commons, on May 11th. Mr. E. Honoratus Lloyd, K.C., on behalf of the promotors, applied for an adjournment. He said that at the last moment they had received from the Minister of Transport a report on the Bill. The points raised by that report were very serious. He had not had an opportunity of placing the report before any one of the boards of directors of the companies. The report suggested that the Committee should not deal with the Bill as a whole, but that, at the most, some temporary powers should be granted, and that the whole matter should be referred to the Minister of Transport, so that he might decide on the actual rates to be charged. The report, Mr. Lloyd added, differed materially from what was said by the Minister in the House on the second reading of the Bill. Counsel for the local bodies which are opposing the Bill assented, and the Chairman adjourned the Committee until after the Whitsun holiday. The Bill as it stands proposes to increase the fares for first-class passengers to 3d. a mile, with a minimum fare of 4d., and for other classes to 1½d. a mile, with a minimum of 2d. Higher rates are also proposed for the conveyance of parcels. —*The Times.*

Accidents.—Traffic on the Victoria Embankment was held up on Wednesday, last week, owing to the derailment of a tramway-car.

Traffic on the Central London Railway was delayed for half an hour, early on the same day, between the Bank and Liverpool Street stations, owing to signal trouble.

Twenty minutes' delay was caused by a tramcar failing to take the points in Holborn on Thursday, last week.

As the result of a collision between a steam lorry and a tramcar at Streatham, on Saturday last, the latter was badly damaged and traffic was held up for a time.

Car-designing Competition.—The London County Council is contemplating a scheme for awarding a prize of £1,000 for what is considered the best design of car for the London services.

New Rolling Stock.—The Highways Committee of the London County Council recommends the purchase of 125 new cars of the "E. 1" type, having seats for 78 passengers each.

Middlesbrough.—New Stock.—The Corporation has sanctioned the purchase of nine new electric cars at a cost of £3,420 each.

Nelson.—Loan.—The Town Council has decided to seek borrowing powers to the extent of £36,000, the estimated cost of a new car-shed, workshops, machinery, and equipment for the tramways. The original estimated cost was £25,000.

Oldham.—Arbitration.—Arbitration proceedings in connection with the purchase of the Oldham, Ashton and Hyde Electric Tramway Co.'s undertaking by the local authorities, will take place in London next month.

Sunderland.—Converted Cars.—On the Corporation system a new all-enclosed car has been put into service. It is the first of six bogie-cars which are being converted at the local car sheds under the direction of the general manager, Mr. A. R. Dayson, and the rolling stock superintendent, Mr. R. Haswell. A new truck is used, which ensures smoother running, the motors are each of 30 h.p., and there are front exit gates. The upper deck is of the saloon pattern, with seats for 40 persons.

Taunton.—Price Dispute.—As the Tramway Co. will not consent to pay more than 2d. per unit for electricity for power (1·2d. per unit was paid under the agreement with the Corporation) the Town Council has decided to apply for the agreement to be set aside under the Courts (Emergency Powers) Act, 1919. The Town Council had asked the company to pay an increase of 100 per cent.

United States.—Monorail Traction.—A monorail system of the type built in Germany 18 years ago has been offered to Chicago's City Traction Commission as a solution of the traction problem, says *Electric Traction*. A model was set up for demonstration by the National Suspended Monorail Co., and, according to the promoters, the system can be operated at a saving of 65 per cent. over the systems now in use. It is claimed that 70 per cent. of the accidents would be eliminated, and that the time of journey would be reduced 50 per cent. There would be no grade crossings, and noise would be eliminated by fitting to the wheels tires made of vulcanised wood fibre. With regard to cost, it is claimed that the system would cost only $100,000 per double-track mile; it is estimated that the cars would have a speed of 130 m.p.h., but in actual service would make 42 m.p.h. with one stop per mile, and 82 m.p.h. in local service. The cars would weigh 12 tons each, and would contain 60 seats per car. The structure, from which the cars would be suspended without the use of under wheels, would be supported every 50 ft. by supports erected on one side of the street only.

TELEGRAPH AND TELEPHONE NOTES.

Bradford.—Wireless Telephony.—The newly-formed Bradford Wireless Society is proposing to erect a wireless station, if permission can be obtained from the Postmaster-General. On May 12th, at a meeting of the Society held at Heaton by the kindness of the President of the Society (Mr. Charles Wood), whose apparatus was used, the members were able to enjoy a concert which took place at the Chelmsford Marconi station, 170 miles away.

Lerwick.—Wireless Station.—The early closing of the wireless station is foreshadowed in an Admiralty order stating that all outstanding demands for stores from this station are to be considered as cancelled. The naval base was closed down on December 13th last, and the Nab Port war signal station was closed on December 18th.—*The Times.*

London.—Wireless Telephony.—The efficiency of wireless telephony as a means of communication between the scenes of fires and the Brigade headquarters in the City was tested at a demonstration in London on Friday, last week. The transmitting and receiving apparatus was carried on the back of a tender, and as soon as it came into position at a pre-arranged spot at Clapham Common, S.W., a pole was hoisted on the tender bearing one end of the aerial wire, the other end being run out and attached to the top of the nearest lamp-post. At the spot chosen for the demonstration there was no ordinary telephone within reasonable distance.

Post Office Employés' Wages.—The Union of Post Office Workers at its annual conference at Morecambe on May 11th accepted the Government offer on the claim made by the Union for a flat wage increase of 10s. per week. The Government offered an immediate increase of 3s. 6d. a week to men and 2s. 6d. to women. This increase is for the main classes only—namely, outdoor postmen, telegraphists and telephonists, and indoor sorting clerks. The usual increments continue, and such a reduction in office classification is arranged as ensures earlier attainment of the maximum. Apart from the money offer, there is secured a reduction of provincial scales from five to three, an extension of the London area to a 12 miles radius from Charing Cross, the existing London area to be Division I, and the new outer area Division II. The wage increases indicated date back to January 1st, and are proportionately extended to overtime worked since that date. The increases secured by the main classes will be the basis of settlement for other classes, and will date back to January 1st.

Telegraph Rates.—The daily Press announces that the new telegraph rates are to be dealt with in a Parliamentary Bill, and will not come into operation on June 1st as was suggested.

Underground Cables.—Underground telephone cables are now being laid by the General Post Office in most of the business centres of the country with the object of improving the stability of the service. One of the ducts now under construction runs from London to Manchester, and is reported to be nearing

Digitized by Google

completion. A start has been made in drawing in the cables. A duct has also been made for the greater part of the distance between London and Bristol, while good progress is reported with that which will connect London with Southampton. The cables between Glasgow and Coatbridge, Dumbarton and Motherwell will soon be ready, while on the short distance between Ormskirk and Preston the arrangements are practically complete. Schemes for linking up Manchester and Liverpool, Bolton and Rochdale, and for connecting Liverpool and Chester are well in hand; and preparations are being made for the underground linking-up of business towns in the Midlands, particularly in the Birmingham district. *The Times* says that it is expected that the whole scheme will be nearing completion towards the end of the present year.

CONTRACTS OPEN AND CLOSED.

(The date given in parentheses at the end of the paragraph indicates the issue of the ELECTRICAL REVIEW *in which the "Official Notice" appeared.)*

OPEN.

Australia.—MELBOURNE.—May 31st. Victorian Railways Department. Four 4,500-KW., 1,500-volt traction converter sets, and eight 1,000-KW., 1,500-volt ditto. (April 30th.)

SYDNEY.—August 4th. N.S.W. Government Railways and Tramways. Two 1,000-KW. sub-station units. Chief Electrical Engineer, 61, Hunter Street, Sydney.

August 3rd. Department of Public Works. Turbines and generators for the Barren Jack hydro-electric development scheme. Department of Public Works, Sydney.

July 18th. City Council. Maximum demand indicators. Electric Lighting Department, Town Hall, Sydney.

PERTH.—July 14th. P.M.G.'s Department. Telegraph and telephone instruments (various parts). Schedule 674.

June 16th. P.M.G.'s Department. Telegraph and telephone instruments (various parts). Schedule 680. (May 14th.)

ADELAIDE.—June 23rd. P.M.G.'s Department. Telephone parts (schedule 541). (See this issue.)

Barnes.—June 7th. Urban District Council Electricity Department. Coal-handling plant and overhead steel or ferro-concrete bunkers. (May 14th.)

Belgium.—June 18th. The municipal authorities of Verlaine (Province of Liége) are inviting tenders for the concession for the supply of electrical energy for lighting and power purposes in the district. Particulars can be obtained from the Maison Communale.

Dublin.—June 7th. Electricity Supply Committee. 12 months' supply of single-phase and three-phase meters.

June 1st. Electricity Supply Committee. 22 direct-current magazine flame arc lamps. (See this issue.)

Edinburgh.—June 19th. Electricity Supply Department. E.H.T. and L.T. switchgear, &c., for Portobello station. (See this issue.)

Lincoln.—May 24th. Electricity Department. Coal-handling plant. (April 23rd.)

Leeds.—June 14th. Electricity Department. 12,000-KW. steam turbine, alternator and condensing plant. (May 14th.)

London.—HACKNEY.—June 9th. Electricity Department. Four water-tube boilers, each 33,000 lb. per hour capacity, with superheaters, mechanical stokers, &c.; four induced-draught plants; four fuel economisers; one 10,000-KW. turbo-alternator and exciter, with ventilating fan and air filter or cooler; one surface condensing plant; two circulating water motor-driven pumps; E.H.T. switchgear; two 20,000-KW. coupler panels; one 10,000-KW. generator panel; six 2,000-KW. and one 4,000-KW. feeder panels. (May 7th.)

BETHNAL GREEN.—June 7th. Electricity Supply Department. Two 500-K.V.A. transformers; one E.H.T. and one L.T. panel; L.T. feeder cables; section pillars and road work. (See this issue.)

Manchester.—June 7th. Electricity Department. Main and auxiliary switchgear; Section A, 33,000-volt and 6,000-volt main switchgear; Section B, pressure-testing switchgear; Section C, 420-volt A.C. auxiliary switchgear; Section D, 240-volt D.C. auxiliary switchgear. (April 30th.)

New Zealand.—WELLINGTON.—June 30th. Tender Board. Public Works. Electrical equipment for the Arthur's Pass section of the Midland Railway. Particulars from the Department of Overseas Trade, 73, Basinghall Street, E.C.

AUCKLAND.—September 1st. Harbour Board. For the supply of electric capstans and spares. Messrs. W. & A. McArthur, Ltd., 18-19, Silk Street, Cripplegate, London, E.C. 2.

Salford.—June 5th. Electricity Department. 12 months' supply of D.C. and A.C. meters. (See this issue.)

Trimdon.—May 25th. Parish Council. Overhauling and repairing the whole of the electric lighting in the villages of Trimdon Grange and Trimdon Colliery. Mr. T. W. Wilkinson, Clerk to the Council, 24, Booth View, Trimdon Grange.

CLOSED.

Bradford.—Electricity Committee:—

Steelwork for firing floor of new boilers.—Redpath, Brown & Co., Ltd.
19 feeder and fuse pillars.—B. I. & Helsby Cables, Ltd.
Steel gangways for pump room at Valley Road works.—F. Fox.

London.—Metropolitan Water Board. Works Committee. Recommended:—

Electrical water-level indicators at 12 reservoirs in Kent, £1,721 approx.—Glenfield & Kennedy, Ltd.

Margate.—Town Council:—

Renewal of electric light installation, pavilion and winter gardens, outside arena.—W. J. Cannon, £190.

Pontefract.—Town Council:—

Electric light installation, assembly rooms.—A. Brook, £52.

Sunderland.—Electricity Committee. Accepted:—

J. Hewdins & Co.—Parts for A.E.G. turbine.
Elliott Bros.—Test-room instruments.
General Electric Co., Ltd.—Seven circuit breakers.
B. I. & Helsby Cables, Ltd.—Cable wagon, E.H.T. cable, 4-core L.T. network cable.
C. C. Wakefield & Co.—Turbine oil.
Ferranti, Ltd.—House-service meters.

Wolverhampton.—Tramways Committee. Recommended:

5,000-gallon petrol storage tank, complete, £471.—Alexander & Steer.
One spare engine and spare back axle for motor omnibuses, £300.—Tilling-Stevens Motors, Ltd.
The Committee recommends the Council to agree to the payment of £896, being 7½% increase in the price of omnibuses, under the emergency clause of the contract with Tilling-Stevens Motors, Ltd.
Two sets of Crellin's patent car body lifting apparatus, £304.—C. Booth and Co.

Electricity Committee. Recommended:—

Three self-balance current transformers; one Fawsett-Parry relay; three 33,000-v. M.P. feeder-current transformers, £472, plus £66 cost of erection.—Reyrolle & Co., Ltd.
Two 500-KW. converters, £8,782 each (revised tender).—Met. Elecl. Co., Ltd.
One 22-KW. mercury arc rectifier equipment, £2,577.—Power Rectifiers, Ltd.

FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Friday, May 21st. At Albemarle Street, W. At 9 p.m. Lecture on "The Thermionic Valve in Wireless Telegraphy and Telephony," by Prof. J. A. Fleming, F.R.S.

Friday, May 28th. At Albemarle Street, W. At 9 p.m. Lecture on "Crystal Structure," by Prof. Sir W. H. Bragg.

Junior Institution of Engineers.—Friday, May 21st. At 39, Victoria Street, S.W. At 7.30 p.m. Social evening.

Friday, May 28th. At 7.30 p.m. Lecturette on "Two Years as an Engineer in the Grand Fleet," by Mr. A. Arnold.

Royal Society of Arts.—Friday, May 28th. At John Street, Adelphi, W.C. At 4.30 p.m. Paper on "Lignite," by Prof. W. A. Bone, F.R.S.

Electrical Power Engineers' Association (Southern Division, London Industrial Section).—Friday, May 28th. At Anderton's Hotel, Fleet Street. At 7.30 p.m. Open meeting.

Physical Society of London.—Friday, May 28th. At the Imperial College of Science, South Kensington. At 5 p.m. Discussion on "X-Ray Spectra," to be opened by the President, Sir W. H. Bragg, F.R.S.

NOTES.

British Oil.—In reply to a question in the House of Commons, Mr. Kellaway stated, on May 11th, that of the 11 wells which had been drilled, one had been abandoned owing to the difficulty of eliminating large quantities of water encountered. Traces of oil had been found in five wells, and one well at Hardstoft, Derbyshire, had a natural flow of 50 barrels per week. An experiment had shown that it would be possible to increase the yield to 250 barrels per week. The total oil produced to date was about 2,800 barrels, or 100,000 gallons. The oil was being stored pending a decision concerning oil rights in this country. Drilling was proceeding in nine other wells.

Mr. Bonar Law, in Parliament on May 13th, stated that the Government had reached a decision regarding the ownership of royalties on oil deposits in Great Britain. A Bill had been drafted, and was receiving the consideration of the Government.

Industrial League and Council.—The half-yearly dinner is to be held in the Wharncliffe Room, Hotel Great Central, Marylebone Station, N.W., on Wednesday, May 26th, at 7 p.m. Mr. H. E. Blain, C.B.E., will take the chair, and the speakers will be Sir Allan M. Smith, K.B.E., M.P., and Mr. W. H. Hutchinson (A.S.E. Executive).

Inquiries.—Addresses of makers of the Stuart centrifugal pump, and Kitching's Crownall shade carrier and light diffusing globe, are asked for.

Digitized by Google

Mr. F. Ayton and the Electric Vehicle Manufacturers.—On Monday last, at the Restaurant Frascati, the electric vehicle manufacturers gave a dinner in honour of Mr. Frank Ayton, M.I.E.E., chairman and hon. secretary of the Electric Vehicle Committee of Great Britain and Ireland, and chief engineer and manager of the Electricity Supply and Tramways Department of the Corporation of Ipswich. Mr. W. H. L. Watson, of Edison Accumulators, Ltd., presided over a gathering of some 60 members of the electric vehicle industry, representing manufacturers of vehicles, batteries, switchgear, and other components. After the toast of "The King" had been honoured, the Chairman proposed the health of Mr. Ayton, recalling the early days when things used to look very black in the electric vehicle industry; at that time Mr. Ayton joined hands with him, and was responsible for the formation of the Electric Vehicle Committee of the I.M.E.A. Since then Mr. Ayton had never relaxed his efforts, in spite of his many onerous duties. Presenting him with a draft for 250 guineas and a silver rose bowl, the Chairman expressed the hope that they would continue to have his assistance in the future. The toast was drunk with musical honours, and Mr. Ayton, in responding, said he could find no words adequately to thank them for their splendid appreciation of his work, which would have been of no avail had he not had the wholehearted support of the committee. He paid a special tribute to the work of Mr. R. A. Chattock, the first chairman of the committee. They were on the threshold of a very big development in the use of the electric vehicle not only of the commercial but also of the pleasure type.

Major WHITTINGTON, proposing "The Electric Vehicle Committee," said he had had experience with horse, petrol, and electric vehicles; the horse drivers, by the adoption of the 8-hour system, had reduced the mileage of a horsed van to 20 or 25 miles a day, there was a prospect of great scarcity of petrol, and the electric vehicle therefore had a great future at hand. Mr. SHRAPNELL SMITH responded, pointing out that the electric vehicle had had to make headway here as a newcomer, whereas in the United States it was in extended use before the petrol truck was developed.

Mr. A. S. MAYS-SMITH (of Motor Manufacturers & Traders, Ltd.) proposed "The Electric Motor Industry," and Mr. E. C. RANSOME (of Messrs. Ransomes, Sims & Jefferies, Ltd.) responded, referring to the high esteem in which Mr. Ayton was held in Ipswich. Mr. E. W. CURTIS also replied with a humorous speech. Mr. V. W. BONE proposed "The Chairman," suggesting that the gathering should become an annual event, and Mr. WATSON, in responding, said that an Electric Vehicle Manufacturers' Association was in course of organisation to co-operate with the Electric Vehicle Committee. Mr. KEMP, proposing "The Visitors," said that in and around Birmingham there were electric vehicles worth £250,000 in use. Charging facilities were the greatest need of the time. Mr. W. E. WARRILOW responded, referring to the hard times in the past and the brilliant prospects for the future of the electric vehicle. At a later stage Mr. AYTON stated that in the past municipalities had met with great difficulties in getting sanction to loans for providing garages and charging facilities; those troubles were now at an end. Applying to the Electricity Commissioners for such powers for Ipswich Corporation, he was assured that the Commissioners were anxious to encourage the use of the electric vehicle, and such applications would receive favourable consideration.

An excellent concert was provided, Mr. S. G. Trehearne being the musical director; amongst the performers were Messrs. Deverill, A. J. Makower, and Kemp, and a novel feature was introduced in the form of two charming dances in costume performed by Miss Mildred Challenger and Miss Thelma Trehearne, which were highly appreciated by the spectators.

Charges for Electricity Supply and Wages of Employes. The following resolution was passed at the last meeting of the Home Counties Industrial Council:—

Resolved: That the Minister of Transport be asked to receive a deputation from the Home Counties Industrial Council for the Electricity Supply Industry with a view to pressing that the statutory charges authorised for electricity supply undertakings be increased where necessary to such degree as to enable them to pay such wages as agreed upon by the Industrial Councils as proper and reasonable for the electricity supply industry, and that the Minister of Transport embody an instruction that such increase shall be devoted primarily to such purposes and that such increases should be given only to such undertakings carrying out the recommendations of the Industrial Councils.

The deputation, fully representative of both the employers and Trade Unions, were received by the Electricity Commissioners, Sir John Snell, Sir Harry Haworth, and Mr. Harry Booth, on Wednesday.

Alderman Wilkinson, of Luton, explained the position generally. He said that the Industrial Councils were charged with the care of all matters concerning the relation of employers and employés, and that nothing could be more pertinent in this connection than the request in the resolution, namely, that the Minister of Transport should afford relief where necessary to undertakings, so that they should be in a position to pay wages as recommended by the Industrial Council. Many claimed that they could not do this at present, and for these he asked that an increase in their maximum prices should be accorded. But he specially emphasised that each such increase should have a proviso that it was conditional upon wages being paid as recommended by the Industrial Council.

Mr. G. W. Spencer-Hawes supported the case by a detailed statement on the financial position of the undertakings in question.

Mr. J. Meakins, of the Enginemen's Union, explained the position of the Trade Union, followed by Mr. Morton and Mr. W. T. Webb, of the Electrical Trades Union, who emphasised the fact that the Union most strongly urged that the wages question should be tied up with any increases granted, as that was the only ground on which the Unions supported the deputation. It was suggested that in future whenever applications from undertakings were made to the Minister of Transport for increase of charges, the Ministry should notify each case to the Industrial Council concerned and if necessary give it power to attend to oppose.

Sir John Snell, after dealing with the legal difficulties involved, expressed himself as appreciating the points at issue, and said that the matter would receive the immediate and most careful attention of the Electricity Commissioners.

Appointments Vacant.—Shift engineer (£223), for the Farnworth Urban District Council Electricity Department; works superintendent (£260 to £300), for the Aylesbury Urban District Council Electricity Works; cable jointer, for the Barrow-in-Furness Corporation Electricity Department; temporary draughtsman (£350), for University College, London; meter tester (86s. rising to £5), for the Hull Corporation Electricity Department; working assistant engineer (£200), for the Hants County Asylum; mains engineer (Rs. 540 per month), for the Calcutta Electric Supply Corporation; sub-station attendant (77s. 9d.), for the Stalybridge, Hyde, &c., Electricity Board; shift engineer (£229), for the City of York Electricity Department; electrical foreman (Rs. 360 per month), in the Locomotive Carriage and Wagon Department, of the South Indian Railway Company. See our advertisement pages to-day.

L.C.C. Appointments.—The Highways Committee of the L.C.C. proposes to invite applications by public advertisement for the three undermentioned vacancies, it being provided that members of the Council's staff will not be precluded from applying:—

(i) Electrical branch. Technical assistant, Grade I.—Salary, based on pre-war conditions, £300 to £400 a year. Total remuneration, including present temporary additions, £480 to £600 a year.

(ii) Electrical branch. Technical assistants, Grade II.—Salary, based on pre-war conditions, £210 to £300 a year. Total remuneration, including present temporary additions, £420 to £480 a year.

(iii) Permanent way branch. Technical assistant, Grade III.—Salary, based on pre-war conditions, £200 to £250 a year. Total remuneration, including present temporary additions, £320 to £385 a year.

Italian Agricultural Machinery Exhibition.—Under the auspices of the Ministero per l'Agricoltura and various societies, including the Unione Esercenti Imprese Elettriche, there is to be held at Rome in August and September, an International Exhibition of Agricultural Machinery. Complementary applications of electricity in subsidiary agricultural operations will also be represented.

The "Lyto" Dry Cell.—Messrs. T. E. Slaughter & Co. ask us to say that their correct address is 172, Church Road, Mitcham, London, S.W.

Service Notes.—Orders have been issued by the Admiralty to the effect that the greatest possible economy is to be exercised by the ships which take electrical power and lighting from Dockyard mains.

Commissioned Electrician F. B. Etherington has been appointed to H.M.S. *Centurion*, from the 6th inst.; Warrant Electrician A. E. Griffin, to H.M.S. *Vernon*, for the Mining School, from the 6th inst.; Warrant Electrician R. Brimacombe, to H.M.S. *Sandhurst*; Captain G. F. Bone, Devon Fortress Engineers (Electric Lights), who recently ceased to do duty with the Machine Gun Corps, has been restored to the establishment of his regiment, with which he has served since 1915; Lieutenant N. W. L. Stafford, Lancashire Fortress Engineers, has been restored to the establishment of his regiment on ceasing to be employed on the staff.

Educational.—UNIVERSITY OF LONDON.—A course of four Advanced Lectures on High-Frequency Alternators for Radio-Telegraphy, by M. Marius Latour, will be given at the Institution of Civil Engineers, Great George Street, S.W., on May 26th and following days, commencing at 5.30 p.m. Admission is free to the lectures. For further particulars see our advertisement pages to-day.

The Kinema in School.—Ealing is considering the extension of its school kinema enterprise by the purchase of film-making apparatus.

Fatalities.—An inquest was held at South Shields last week upon the body of Robert Henderson (37), an electric crane driver, who was killed while following his employment at the shipbuilding yard of Messrs. John Redhead & Sons. Henderson, it was stated, was cleaning the electric crane in the engine works, and had been warned by the foreman and another man that the current was on. He was engaged on the upper part of the crane when he was heard to give a loud groan and seen to fall off the crane. He struck some shafting and fell upon some boxes 25 ft. below. When he was picked up, life was extinct. The foreman of the jury expressed the opinion that deceased, instead of going towards the permanent ladder, had been taking a short-cut under the live wires to another ladder which was standing against the crane.—A verdict that death was the result of an electric shock and fracture of the skull was returned.

INSTITUTION NOTES.

Institution of Electrical Engineers.—Western Centre.—At Cardiff, on April 12th, Prof. F. Bacon lectured before this Centre on "Thermionic Valves." The lecture was followed by a discussion, and various types of valves and valve apparatus were exhibited. The lecture was illustrated by lantern slides, and a number of experimental demonstrations were made by the lecturer.

Recapitulating the main points of the lecture, there was, said the lecturer, first, a broad division between two-electrode valves, or thermionic rectifiers, and three-electrode valves, in which a grid, spiral, or other form of "control" electrode was interposed between the filament and the plate. Then there was a fundamental physical difference between the present-day hard valve, in which the vacuum was so high that the pure electronic discharge from the incandescent filament was not perceptibly interfered with by the molecules of the residual gas, in contradistinction to the "soft" or "gas" valve, in which the molecules of the residual gas played an essential part by supplying positive ions, which carried the bulk of the current and largely neutralised the space-charge effect. Considering a mechanical analogy, hard valves were like hydraulic valves of small size closed by a stiff spring; soft or gas valves were like pneumatic valves of large area and closed by a very weak spring. Next, one could draw distinctions between the material nature of the cathode and the method employed for causing it to emit electrons. By calling a valve "thermionic," they limited themselves to the employment of cathodes in which thermal agitation was used for provoking the emission of electrons. In a broad review of the subject, however, it seemed legitimate and desirable to include mercury rectifiers and Pointolites as special forms of soft thermionic valves, in which the hot spot on the cathode was maintained by bombardment of positive ions assisted by high current density. The standard form of cathode for the ordinary thermionic valve was a filament of tungsten heated by a separate source of low-tension supply, which might be either D.C. or A.C. For valves employed in reception circuits, which included telephones, every precaution had to be taken to avoid coupling to sources of supply containing ripples of audible frequency. For instance, the telephones would scream if filament heating or plate voltage was obtained from ordinary supply mains. In such cases it was imperative that only batteries of primary or secondary cells be used. In other cases, however, it was quite satisfactory, and generally preferable, to heat the filaments with low-tension A.C. obtained from the secondary of a special heating transformer. The only alternative to the tungsten filament that had been used to any extent in thermionic valves was the Wehnelt cathode, consisting of a filament of platinum coated with lime or other oxides. Such filaments had high efficiency in that they emitted a great number of electrons per watt expended in heating; but they rapidly disintegrated, and were not suitable for the modern hard valve. Perhaps the very rapidity and completeness with which the three-electrode valve had fulfilled every requirement and surpassed every expectation of the wireless engineer had tended to distract attention from the useful possibilities of the two-electrode valve, both of the hard and soft varieties, to the electrical power engineer. In this connection, the lecturer had attempted to draw attention to certain modest yet useful functions which it could already discharge. The mercury rectifier already bade fair to oust the rotary converter, and the practical difficulties which stood in the way of building thermionic valves in steel containing vessels, suitable for heavy currents, were to a great extent the same as those which had just been surmounted in the case of the mercury rectifier. It would be rash to pooh-pooh the idea that they might be on the eve of great things due to the introduction of some improved, enlarged, and robust type of thermionic valve into the main distribution schemes of heavy electrical engineering.

It will be remembered that a small deputation of members of the Institution, representative of the various branches of the industry, visited Holland in September, 1919, at the invitation of the Dutch Association of Electricity Works' Managers. Arrangements are being made for a return visit of Dutch engineers to this country in July next. It is hoped that the visitors will also take part in the summer meeting of the Institution at its Western Centre.

Association of Mining Electrical Engineers.—Developments in the application of electrical machinery in mines were foreshadowed in a paper read before the Yorkshire branch of the Association at Wakefield on April 16th, by Mr. J. R. Haigh, engineer at the Lofthouse Colliery, who said that the first requisite was to pass an electrical wave of enthusiasm through the management, and remove the bias from the minds of the majority of engineers at most collieries. It could be proved that by the application of electricity, £200 per week had been saved in the boiler fuel consumption alone. The whole training of a colliery engineer needed drastic revision; it was the worst policy to install valuable plant and then advertise for the cheapest man to look after it. The first step towards reducing the cost of working on the surface was to remove that most prolific source of waste—the steam exhausted into the atmosphere. This exhaust from the winding engines could be made to generate sufficient electricity to drive the whole of the auxiliary plant and leave a surplus for further extension. Scrapping the old wasteful steam winding engines was too drastic a policy, but by removing the old cylinders and replacing them with Corliss valve gear, a few more tons per shift could be wound. From 20 to 25 per cent. could be easily saved by housing the boilers and lagging the steam ranges, instead of leaving them exposed to the elements. By the introduction of stokers designed to burn unsaleable coal, 200 to 250 tons per week could be burnt upon the grates of Lancashire boilers. Every steam engine on the surface, and all steam pumps in the shaft, should be superseded by electric motors. With regard to new collieries, the author advocated still more complete electrification. Electric winders would be employed; there was a limit to the depth from which coal could be wound by steam plant, whereas by electric winders it would be possible to win coal from depths not yet dreamt of. In the future when the seams near the surface had been worked out, seams of thicker sections than those at present worked would be found, and the only means to win these seams would be by the electrical energy raising the coal from the lower levels to those already worked out, by a succession of winding gears, the tubs being electrically transferred from one cage to the other. The system of ventilation could be carried on in the same way. Electric winders gave smoother acceleration, and the ropes lasted longer; they gave easier methods to secure safe working and freedom from over-winding, and automatic arrangements were easier to adopt. Decking arrangements could also be made more cheaply by electrical appliances. The screening plant should also be electrically-driven, wagons under the screens propelled by electric capstans, and any other haulage should be by electric locomotives in preference to the expensive steam locomotives. The rest of the surface plant should be electrically-driven, and the provision of an electric welding shop, Mr. Haigh showed, would effect great economies in the production of tubs, as one man could weld the plates together and make a good strong tub in three hours; repairs to the various plant could also be effected more economically and expeditiously by electric welding. No animal should be allowed underground in the colliery of the future; the whole of the haulage should be accomplished by electric battery locomotives getting right up to the coal face. Finally, Mr. Haigh urged the need of a school at each mine where all the workers could see scientific experiments carried out and hear lectures, so that they might intelligently understand the mechanism which they were called upon to manipulate. Nothing hindered production like ignorance; the miner should be educated to understand the possibilities of the mysterious power which had come to his assistance, and to treat it in a manner which could only lead to the end in view—increased production.

At a meeting of the Association at Leeds, on May 8th, the following officers were elected for the year 1920-21:—President, Mr. J. W. Harbottle (Fryston); vice presidents, Mr. J. W. Mitchell (Barnsley) and Mr. J. T. Lee (Featherstone); hon. secretary and treasurer, Mr. W. Winter (Castleford); auditor, Mr. H. Green; council, Messrs. R. Holiday (Ackton Hall), A. R. Clayton (Dewsbury), F. Mawson (Wakefield), Major F. Mellor (Leeds), Mr. J. H. Haigh (Lofthouse), Mr. E. A. Moorhouse (Nostell) and Mr. T. Crossley (Barnsley).

Royal Institution.—On Saturday, May 29th, Prof. J. H. Jeans commences a course of two lectures on "Recent Revolutions in Physical Science." (1) "The Theory of Relativity"; (2) "The Theory of Quanta." The Friday evening discourse on May 28th, will be delivered by Prof. Sir W. H. Bragg on "Crystal Structure," and on June 4th by Sir Ronald Ross on "Science and Poetry."

Wireless Society of London.—At a meeting of the Society held on April 30th, a paper was read on an automatic call device by Major Basil Binyon, O.B.E. By means of an aerial which had been erected, Major Binyon was able to give a practical working demonstration of the mechanism. Pre-arranged messages were received from his wireless station at Slough, and the selector mechanism proved beyond doubt that it would respond only to signals which it was set to receive. By the use of this apparatus it is, therefore, possible to make use of only one operator on board ship, so that during the less busy hours of the day the automatic call device may be left to take incoming signals, and on the receipt of a message giving the call signal of the ship in which it is installed, or the distress signal S.O.S., a relay is put in action, a bell rung, and the operator called to his instruments.

Twenty new members and associate members were elected, including the Society's first lady member.

The Institute of Metals.—The annual autumn meeting will be held at Barrow-in Furness, on September 15th and 16th next. Particulars can be obtained from the Secretary, Mr. G. Shaw Scott, M.Sc., 36, Victoria Street, S.W. 1. The annual May Lecture will be delivered by Prof. C. A. F. Benedicks, Ph.D., at 8 p.m., on June 10th, at the Institution of Mechanical Engineers, Storey's Gate, Westminster, the subject being "Recent Progress in Thermo-Electricity." Prior to the lecture a ballot for the election of members and students will take place. Persons so elected will be entitled to be present both at the lecture and at the Barrow meeting, whilst their first annual subscription will cover the extended period ending June 30th, 1921. Membership forms can be obtained from the above address.

Edinburgh Electrical Society.—At the annual meeting held on May 12th, Mr. T. S. Munnoch, chairman, referred to the excellent progress made by the society during the first year of its existence. The treasurer submitted a gratifying account of the financial condition of the society, which, without calling on the support of patrons, was more than paying its way. Prizes were presented to three apprentice members for papers which they had submitted for competition, and president and secretary were thanked for their good services during the year.

The office bearers for next session were elected as follows:—Chairman, Mr. Donald Macintosh; vice-chairman, Mr. D. S. Munro; committee, Messrs. Law, McLean, Stark, and Bee; hon. secretary and treasurer, Mr. W. S. Johnson, 11, Comely Bank Street, Edinburgh.

It was decided to open next session with a social function, to be held during September, and the secretary is now open to receive papers to be included in the new syllabus.

North-East Coast Institution of Engineers and Shipbuilders.—At Newcastle-on-Tyne, on April 30th, Mr. J. S. Watson read a paper on "A Modern Power Station and Its Development," and discussed the subject by tracing the development which had taken place in connection with the generating plant installed by the Newcastle-on-Tyne Electric Supply Co., Ltd. The historical aspect of the subject was dealt with by dividing the period of 29 years into four stages. Before dealing with the various stages in detail, Mr. Watson mentioned the important fact that plant in the various stages was superseded and scrapped, not because it was worn out, but because in the march of science, other plant so much more efficient had been developed that it no longer paid to run the old plant. During the gradual development of Carville "A" station, the utilisation of waste heat in connection with the working of coke ovens and blast furnaces received the special attention of the company, and the third, or waste-heat, stage of development was entered. The location of the waste-heat stations was decided by the position of the coke-oven and blast-furnace plant from which the waste power could be obtained. The turbines consisted of either high-pressure, or exhaust-steam, plant depending on the class of power available. The object in view being to utilise to the full the waste power available at the lowest possible labour cost, no spare plant was provided, and the station ran at the maximum capacity possible, any variation being met by larger coal-fired stations. The waste-power stations ran continuously, except for the period of overhaul necessary from time to time. Continued demands necessitated the provision of further plant with the result that the fourth stage was arrived at. It was then decided to erect another station now known as Carville "B," having a capacity of 50,000 KW. As this was the last station to be brought into commission, and as it showed a further marked improvement in economy, the author gave a more detailed description of the plant.

It was claimed that the station described was the most efficient, not only in this country, but probably in the world. The returns issued by the Coal Mines Department of the Board of Trade showed that on the North-East Coast where coal was relatively abundant, and of a low price, the most economical generating plant was in operation. The author emphasised the fact that the characteristic changes which had taken place in all stages had been:—The increase in boiler pressure, increase in steam pressure, the higher speed of plant (consistent with the periodicity of the system), the larger individual size of the generating units, and the more complete utilisation of labour-saving appliances. The principal features referred to were summarised as under:—Total capacity of the system was 186,450 KW., which was contained in 18 stations, of which four operated by means of coal firing; three by coal firing and coke-oven gas; three by waste heat from coke ovens; and eight by exhaust steam from blowing engines, &c. The capacity of individual stations had increased from 2,400 to 50,000 KW., and the average capacity of boilers from 6,000 to 45,000 lb. Boiler pressure had risen from 120 to 270 lb., and the steam temperature from 350 to 675° F. Average capacity of machines increased from 267 to 10,000 KW., and the speed from 85 to 2,400 R.P.M. The steam consumption had decreased from 28·5 lb. to 10 lb. per KW.-hour. The KW. capacity per sq. ft. of area occupied had increased from 0·3 to 15 KW., and the KW. capacity per man engaged in operation from 141 to 633 KW. A discussion followed the reading of the paper, and Mr. Watson, in replying, said average cost of coal to the company had gone up by over 200 per cent., wages and other items had gone up by 145 per cent., but the average receipts, as a result of the extra costs incurred, had only increased by 54 per cent. He strongly advocated the development of waste-heat supplies.

South-Eastern Union of Scientific Societies.—The twenty-fifth annual Congress will be held at the Town Hall, Eastbourne, on June 2nd, 3rd, 4th and 5th. The proceedings mainly relate to biological and geological subjects, and include several visits to places of interest. The hon. general secretary is Mr. H. Norman Gray, 334, Commercial Road, London, E. 1.

Physical Society of London.—At the meeting held on April 23rd, 1920, the fourth Guthrie Lecture was delivered by M. Charles Edouard Guillaume, who lectured on "The Anomaly of the Nickel Iron Alloys: Its Causes and its Applications" He showed and explained curves showing the variation of magnetic properties, and of the coefficients in the expansion equation for alloys, and showed from the curves how it was possible to obtain alloys with any desired coefficient. The chief weakness of the alloys, from the point of view of the metrologist, was instability. With increasing carbon content the instability very rapidly increased. The curve connecting the instability and the carbon content passed through zero, showing that the instability was due to the carbon. It was, therefore, possible to get an invar of perfect stability. Among the applications to which invar had been put, the speaker instanced pendulum rods, leading-in wires for electric lamps (an alloy being chosen from the curves, so as to have the required coefficient of expansion, wire standards for base measurements in surveying, &c. Another important application of those alloys was in chronometer construction. The temperature coefficient of the rate of a watch was due to variation of the elasticity of the hair-spring. It was possible to compensate the elasticity variation over the whole range. Sir R. T. Glazebrook, in proposing a vote of thanks to the lecturer, said that it was largely to the work of M. Guillaume in the early days of the Bureau at Sèvres that they owed their knowledge of mercurial thermometry. The lecturer had illustrated the important connection between science and industry, and how, if that connection were to be strong and productive of the best results, it was necessary that scientific investigations should be carried out to their fullest extent. They had seen how, in the first place, the various physical properties of these steels had been examined, and how the results so obtained had subsequently been of the highest value in solving problems of great practical importance.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW *posted as to their movements.*

At an investiture held in Newcastle by Prince Henry on 7th inst., Capt. L. E. MOLD, of Messrs. A. Reyrolle & Co., Ltd., Hebburn-on-Tyne, was decorated with the O.B.E. (Military Division) for services in France.

On May 7th the staff engineers of the York Corporation electricity department held their first annual dinner at the New White Swan Hotel. In the unavoidable absence of the chief engineer, Mr. E. J. NICHOLS took the chair. After dinner a musical programme was given by Messrs. J. P. Wood, T. Gowland, E. J. Nichols, and other members of the staff. The chairman, on behalf of the staff, presented a suit case to Mr. E. M. Pearson, mains superintendent, who is about to take up a similar post at Stepney.

Mr. A. B. MUIRHEAD, who has been identified with the business of D. Selby Bigge & Co., consulting engineers, of 53, Bothwell Street, Glasgow, for 20 years, has become a partner in the firm, which will continue under the same title.

Mr. E. MORGAN, Assoc.M.Inst.C.E., A.M.I.E.E., who for the past ten years has served with the Yorkshire Electric Power Co. (latterly as operation engineer), has been appointed technical and engineering assistant to the chief engineer and general manager of the Wolverhampton Corporation electricity undertaking.

The salary of Mr. T. B. MOSELEY, chief clerk of the Bradford Corporation tramways department, has been increased from £400 to £425.

Weymouth T.C. has appointed Mr. G. NICHOLSON, assistant electrical engineer, as borough electrical engineer, at a salary of £500 a year, with free residence, the question of salary to be reconsidered at the end of six months.

Mr. H. ENGLAND, the convener of the Yorkshire and District Tramway Managers' Association, Leeds, was recently presented by the members with a silver rose bowl in recognition of services rendered to the Association since its formation in 1904.

Faversham T.C. has increased the salary of the electrical engineer (Mr. G. SOMMERVILLE) to £430 a year, plus £20 for special services rendered at the sewage works.

Whitehaven T.C. has increased the salary of the borough electrical engineer (Mr. HOGARTH) from £450 to £500.

It is proposed to increase the salaries of the Accrington Corporation electrical engineer and tramways manager respectively from £500 to £650 as from April 1st last, with an additional increase of £50 each from April 1st, 1921.

The *Times* states that General Sir Arthur William Currie, G.C.M.G., K.C.B., who formerly commanded the Canadian Corps in France, has been appointed Principal of McGill University, Montreal, in succession to the Rt. Hon. Sir Auckland Geddes.

Mr. E. S. BARRALET, who has been manager of Messrs. Pinchin, Johnson & Co.'s insulating varnish department for the last 18 years, has been appointed a director of the company.

The *Times* states that Dr. DEUTSCH, head of the A.E.G., arrived in Paris on Tuesday to take part in the forthcoming economic negotiations between German and French business men.

The Highways Committee of the L.C.C. recommends the following appointments in connection with the reorganisation of the Council's tramways department: Mr. J. R. WIGNAL to be principal technical assistant in the permanent way branch (as from August 1st, 1921); Mr. F. H. Wigner, senior technical assistant in the electrical branch; Messrs. A. W. Leech, F. Cook, J. J. Harding, and C. W. Fourniss, technical assistants, Grade II. in the rolling stock branch; Mr. E. H. Beel, technical assistant, Grade II, in the permanent way branch; Messrs. W. Press, C. E. Wheeler, and A. Pearce, technical assistants, Grade III. in the electrical branch; Mr. H. S. Sellar, motor school superintendent; Mr. A. F. Bentall, rolling stock inspector; and Mr. J. R. Walker, assistant power station engineer, to be inspecting engineer in the electrical branch.

Mr. C. C. VALDER has been appointed supplies manager of Messrs. Siemens Brothers & Co., Ltd. (Sheffield branch), 23, Filey Street, Sheffield. He has been employed with the firm since 1910, originally in the fittings department, and since demobilisation in the estimating department of the lamp and supplies department, Upper Thames Street, London, E.C. He served with the forces all through the war, and his military record was particularly good. In 1914 he was a sapper in the London Electrical Engineers, after which he was gazetted second lieutenant in the King's Own Royal Lancashire Regiment. Later he became captain in charge of Divisional Artillery Signals, and was eventually temporarily in command of the 66th Division Signal Company of the Royal Engineers from July, 1915, to June, 1919. While in this position he was awarded the M.C. for meritorious service at Landrecies.

NEW COMPANIES REGISTERED.

Dunblane and District Electricity Supply Co., Ltd. (11,193).—Private company. Registered in Edinburgh May 5th. Capital, £500 in £1 shares. To carry on the business indicated by the title. The first directors are: H. J. Osborn, Wynthorpe, Baxter Road, Sale, Cheshire, engineer; W. Sharp, Hillside of Keir, Dunblane, farmer. Registered office: 213, West George Street, Glasgow.

Falkesley Electrical and Kinema Supplies, Ltd. (167,214).—Private company. Registered May 7th. Capital, £5,000 in £1 shares. To take over the business of film renters, agents and producers, electrical contractors, patentees of a curtain controller, cinematograph agents, &c., carried on by F. E. Clipstone at Thurland Street, Nottingham. The first directors are: F. E. Clipstone, Highbury Avenue, Keyworth, Notts; S. H. Brown, J.P., 92, Noel Street, Nottingham; B. Smith, 7, Sussex Street, Nottingham. Qualification, £25. Solicitor: A. F. Neane, Burton Street, Nottingham. Registered office: 6, Thurland Street, Nottingham.

New Process Electric Lamp Co., Ltd. (167,268).—Private company. Registered May 8th. Capital, £5,000 in £1 shares (3,000 preference). To take over the business of electric lamp manufacturers and agents carried on by S. Coxon and W. A. Williams at Canning Place, Liverpool, under a similar title. The first directors are: S. Coxon, 20, Catton Avenue, Liverpool, electrical engineer; W. A. Williams, 56, Canterbury Road, Wallasey, Cheshire, electrical engineer. Solicitor: Eskrigge, Roby & Carr, 5, Cook Street, Liverpool.

Goodall Electric, Ltd. (167,261).—Private company. Registered May 8th. Capital, £2,000 in £1 shares. To take over the business of electricians carried on by T. J. Stapley, W. J. Mills and T. C. Jones at 17a, South Castle Street, Liverpool, as the "Standard Electric Co." The first directors are: L. Jackson, 47, Saxonia Road, Walton, Liverpool; T. R. M. Chetter, 64, County Road, Liverpool. Solicitor: E. B. Driffield, 20, Castle Street, Liverpool. Registered office: 64, County Road, Walton, Liverpool.

H. A. Bryce, Ltd. (167,372).—Private company. Registered May 12th. Capital, £5,000 in £1 shares. To take over the business of an electrical engineer carried on at 69, Middlewood Road, Sheffield, by Herbert A. Bryce. The first directors are: H. A. Bryce, 69, Middlewood Road, Hillsbrough, Sheffield, electrical and mechanical engineer; J. Enock, 3, Seaside Road, Sheffield, builder; J. R. Marsh, 1, Swaledale Road, Sheffield, electrical engineer. Registered office: 69, Middlewood Road, Hillsbrough, Sheffield.

Lester & Browne (London), Ltd. (167,288).—Private company. Registered May 10th. Capital, £5,000 in £1 shares. To carry on the business of manufacturers of and dealers in electrical accessories, apparatus and appliances, electrical, chemical and general engineers, &c. The first directors are: G. W. Lester, 71, Carlton Road, Tufnell Park, N.; G. E. Lea Wynne, 58, Hilldrop Crescent, N.7; E. H. Bonney, 11, Sunninghill Road, Lewisham, S.E. Solicitor: H. Borradaile, Old Serjeants' Inn Chambers, E.C. Registered office: 44 and 46, Surbiton Road, Kingston.

T. E. Slaughter & Co., Ltd. (167,338).—Private company. Registered May 11th. Capital, £7,500 in £1 shares. To take over the business of manufacturers of and dealers in "Lyto" dry cell and other electric batteries carried on by T. E. Slaughter and others at 172, Church Road, Mitcham. The first directors are: Mrs. E. A. Dollar, 13, Hyde Park Square, W.; W. H. Edridge, 24, St Mary Abbott's Terrace, W.14; T. E. Slaughter, 5, King's Road, Wimbledon, S.W.; E. E. G. Boite, 13, Portland Street, Cheltenham. Solicitors: Edridge, Son & Marten, 4, High Street, Croydon. Registered office: 172, Church Road, Mitcham, Surrey.

Taylor & Kay, Ltd. (167,339).—Private company. Registered May 11th. Capital, £2,000 in £1 shares. To carry on the business of manufacturers of lamp shades and electrical accessories, electrical engineers, &c. The subscribers (each with one share) are: W. M. Groom, 49, South Croxted Road, West Dulwich, S.E., surveyor; L. Wheeler-Taylor, 37, Essnedine Road, Maida Vale, W.9; H. Kay, 29, Colville Terrace, Bayswater, W., motor engineer. The first directors are: W. M. Groom, L. Wheeler-Taylor, H. Kay, H. E. Rainbow. Secretary: F. P. James. Registered office: 327, Edgware Road, W.

Western Anglo-Swedish Electric Welding Co., Ltd. (167,396).—Private company. Registered May 12th. Capital, £25,000 in £1 shares. To carry on the business of electric and other systems of welding, engineering, dealing in plant, machinery, ships, vessels and hardware, &c. The subscribers (each with one share) are: H. J. Richards, 133, The Exchange, Cardiff, consulting engineer; E. H. N. Moxon, 101, Leadenhall Street, E.C., shipbroker. The subscribers are to appoint the first directors. Solicitor: P. J. Nicholls, 17, Farringdon Street, E.C. Registered office: 25, Mount Stuart Square, Cardiff.

John Porter Engineering Co., Ltd. (167,411).—Private company. Registered May 13th. Capital, £10,000 in £1 shares. To take over the business of a general electrical and motor engineer carried on by J. Porter at North Shields. The permanent directors are: W. Lilburn, Netherton, Heaton Road, Newcastle; J. C. Patterson, 4, Churchill Gardens, Jesmond; J. H. Richardson, 37, Linskill Terrace, North Shields; J. Porter, 117, Chirton, West View, North Shields; A. Melrose, 22, Northumberland Square, North Shields; R. Saunders, 46, Park Crescent East, North Shields;; R. W. Stranghan, 155, Grey Street, North Shields. Solicitor: F. C. Chitt, 34, Grey Street, Newcastle-on-Tyne.

T. Emery's Automatic Power Generating Motors, Ltd. (167,337).—Registered May 11th. Capital, £10,000 in 5,000 preference shares of £1 each and 100,000 founders' shares of 1s. each. To take over from T. Emery certain inventions and patent rights, and to carry on the business of manufacturers of self-starting automatic power generating motors for power stations and factories, and for generating light and heat in public buildings, hotels, theatres, kinemas and private buildings, high-speed motors for trains and electrically-driven agricultural machinery, high-speed turbines for ships and battleships (instant reverse motion), motor cars, motor cycles and scooters, high-speed light motors for aeroplanes, timepieces, town clocks, watches, musical instruments, such as organs, gramophones and mechanical toys, &c. The memorandum of association as originally printed contained a clause as follows: "In view of the world-wide importance of Mr. Emery's inventions, the company shall have power to increase its capital to £25,000,000. Upon any such increase of capital such new shares shall be issued in the same terms, in the same proportions as the original share capital of the company," but this clause has been deleted and the deletion initialled by all the subscribers. Another extraordinary clause appears (*i.e.*, remains in) the articles of association, to the effect that Mr. T. Emery "intends to devote" not less than 50 per cent. of the net proceeds he receives by way of dividends "towards relieving the temporary distress that may result from the introduction of this invention, and any surplus to any other more needy and deserving cases, or education of the poor." The subscribers (each with one preference share) are: Dmitri Tchernine, 25, Windsor Court, Bayswater, W., journalist; W. T. C. Lock, "Totteridge," Temple Road, Epsom, director of companies; Major C. E. New, O.B.E., The Limes, Kingston Hill, Surrey; D. Jenkins, Bryntirrion, Aberporth, South Wales, shipowner; T. Emery, 26, Marsham Street, S.W., British and foreign patentee; W. W. Coltart, Tower House, Epsom, surgeon; S. C. Robertson, 14, Disraeli Gardens, Putney, S.W., engineer draughtsman. The first directors are: Dmitri Tchernine, W. T. C. Lock and T. Emery, all of whom are permanent. T. Emery is managing and technical director. Remuneration of T. Emery, £5,000 per annum; chairman, £2,500 per annum; ordinary directors, £1,000 per annum. The purchase consideration for the inventions is £5,000, payable wholly in founders' shares, of which the vendor directs 20,000 to be allotted to Mr. Cole Lock and 15,000 to the International Exchange and Banking Corporation, Ltd. The papers were filed by the last-named company. Solicitor: C. B. Lumley, 130, Strand, W.C. Registered office: 392, Strand, W.C.

B. Young & Co. (Birmingham), Ltd. (167,254).—Private company. Registered May 8th. Capital, £3,000 in £1 shares. To carry on the business of electrical and mechanical engineers, &c. The subscribers (each with one share) are: S. F. Outon, 1,246, Pershore Road, Stirchley, Birmingham, engineer; B. Young, Mignon Cottage, Jordan Road, Four Oaks, Warwick. B. Young is the first director. Registered office: 100, Leek Street, Birmingham.

British Electric Lamps, Ltd. (167,205).—Private company. Registered May 7th. Capital, £20,000 in £1 shares. To take over (1) the business of manufacturers of and dealers in electric lamps carried on by E. R. Grote at 173, Hartfield Road, Wimbledon, and (2) the business of manufacturers of and dealers in electric candles, lights and stoves carried on by the Lux Candle Co., Ltd. The first directors are: E. R. Grote, Lynwood, Church Lane, Merton, Surrey; A. A. Barren, Headlands, Berkhamsted (director, Lux Candle Co., Ltd.). Holders to be appointed by subscribers. Solicitor: E. A. Davidson, 2, Gresham Buildings, Basinghall Street, E.C. Registered office: Spencer Hill Road, Wimbledon, S.W.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

J. C. H. Martin, Ltd.—Equitable mortgage on The Bear Yard, dated April 29th, 1920, to secure all moneys due or to become due from company to Barclay's Bank, Ltd.

Thermo Electric, Ltd.—Sir Arthur F. Whinney, K.B.E., of 46, Fredericks Place, Old Jewry, E.C., as Receiver on April 29th, 1920, under powers contained in certain debentures.

Coatbridge and Airdrie Electric Supply Co., Ltd.—Charge on the company's undertaking and property, present and future, including uncalled capital and the Coatbridge and Airdrie undertakings, benefit or certain agreements, contracts, &c., dated December 20th, 1919 (supplemental to mortgage dated March 1st, 1904), to secure £7,000. Holders: County of London Electric Supply Co., Ld.

Brompton and Kensington Electricity Supply Co., Ltd. (28,919).—Capital, £300,000 in 20,000 preference and 40,000 ordinary shares of £5 each. Return dated April 1st, 1920. 5,662 preference and 34,338 ordinary shares taken up. £195,000 paid on 5,662 preference and 33,338 ordinary. £5,000 considered as paid on 1,000 ordinary. Mortgages and charges, nil.

British L.M. Ericsson Manufacturing Co., Ltd. (79,061).—Return dated March 31st, 1920. Capital, £200,000 in £1 shares (99,990 preference and 100,010 ordinary). All shares taken up. £170,000 paid (being £1 per share on 50,010 ordinary and 99,990 preference and 8s. per share on 50,000 ordinary). £30,000 considered as paid on 50,000 shares (being 12s. per share). Mortgages and charges, £50,000.

Burgess Hill and District Electrical Supply Co., Ltd.—Return dated March 19th, 1920. Capital, £6,000 in £1 shares (3,000 ordinary and 3,000 preference). All shares taken up. £5,900 paid. £100 considered as paid. Mortgages and charges, £1,200.

City of London Electric Lighting Co., Ltd.—Return dated April 7th, 1920. Capital, £1,200,000 in £10 shares (80,000 ordinary and 40,000 preference). 70,595 ordinary and 40,000 preference shares taken up. £1,105,950 paid. Mortgages and charges, £800,000.

County of Durham Electrical Power Distribution Co., Ltd. (61,591).—Return dated March 30th, 1920. Capital, £425,000 in £1 shares. 400,000 shares taken up. £400,000 paid. Mortgages and charges, £250,000.

Kensington & Knightsbridge Electric Lighting Co., Ltd. (26,193).—Capital, £350,000 in 50,000 ordinary, 10,000 1st preference, and 10,000 2nd preference shares of £5 each. Return dated March 25th, 1920. 21,000 ordinary, 10,000 1st preference, and 10,000 2nd preference shares taken up. £179,840 paid on 15,968 ordinary, 10,000 1st preference, and 10,000 2nd preference. £25,160 considered as paid on 5,032 ordinary. Debt due from company in respect of mortgages and charges at date of return, £115,000; ditto guaranteed jointly by this company and Notting Hill Electric Lighting Co., Ltd., £225,000. Registered since date of return. Issue on April 13th of £25,000 debenture, part of a series already registered.

CITY NOTES.

Oriental Telephone and Electric Co., Ltd.

The gross earnings during 1919 were £124,648, plus £11,502 brought forward. Working expenses, maintenance, &c., absorbed £70,909; debenture interest and redemption charges have been provided for. The dividend on the ordinary shares is 10 per cent., and the bonus 2 per cent., both free of tax; £5,000 is put to general reserve; £2,000 to staff pension fund; and £11,013 carried forward. The operations of the branches and subsidiaries have continued to show increased revenues. The great obstacle to further expansion has been the difficulty in procuring supplies of material and their shipment to the East. An improvement in this direction is already apparent, with the result that it should soon be possible to overtake arrears and give facilities to intending subscribers whose names are now on the waiting lists. For this purpose several technical assistants were sent to the East during 1919. The reconstruction of the Singapore exchange building has been completed, and the new switchboard equipment is now being brought into use. At December 31st, 1919, the company had, in all, 8,020 exchange and private lines in operation, a net increase of 730. The following dividends have been declared by the Indian local companies, viz.: 18 per cent. by the

Digitized by Google

Bombay Telephone Co., Ltd., as against 16 per cent. for the year 1918; and 8 per cent. by the Bengal Telephone Co., Ltd., as against 7 per cent. At December 31st, 1919, the Bombay Co. had 7,880 exchange and private lines in operation, being a net addition of 830 during the year, and the Bengal Co. 6,846 exchange and private lines, being a net addition of 547. The gross revenue of the China and Japan Telephone & Electric Co., Ltd., has been increased, but the net result of the working is rather less favourable than that of the previous year on account of the high price of material and labour and the adverse effect of the continued rise in exchange. At December 31st, 1919, the company had 5,575 exchange and private lines in operation, a net addition of 804. The previous rate of dividend, viz., 10 per cent., free of income tax, has been maintained. The liquidation of the Telephone Co. of Egypt, Ltd., has not yet been completed. A distribution of £29,632 announced by the liquidator on December 24th, 1919, and the receipt by this company of that sum on January 1st, 1920, has enabled a further amount of 2s. 6d. per share to be distributed as capital amongst the ordinary shareholders, and the capital reserve account has thus been reduced to £173,464 since the close of 1919.

General Electric Co. (U.S.A.).

The report of this company for 1919 shows that the value of the orders received was $237,623,932, as compared with $234,134,037 for 1918. For some months succeeding the armistice, the volume of business booked was much curtailed; but during the last eight months of the year orders steadily and rapidly increased, so that the present demand for the company's products is greatly in excess of the capacity of its factories. At the close of the year the amount of orders unfilled was $98,880,000, compared with $80,000,000 at the end of 1918. The great increase in orders for all classes of apparatus manufactured by the company makes it necessary to add substantially to its manufacturing capacity. This is being accomplished partly by enlarging its present plants and in part by purchasing, or leasing with option to purchase, factories already constructed which offer immediately available facilities, thus enabling the company to secure an earlier output than would be possible by erecting and equipping new factories of like capacity. The total factory floor space has been increased from 19,581,000 sq. ft. in 1918 to 20,681,000 sq. ft. in 1919.

The company has for several years been engaged, in its research laboratories and factories, in the development and manufacture of apparatus and devices essential to the transmission and reception of wireless communications. Its inventions have had a far reaching effect on the entire radio art. The Marconi Wireless Telegraph Co. of America is also the owner of valuable patents, rights, and licences, and it has seemed wise to the boards of directors of both companies that their research and engineering resources should hereafter be used in closest co-operation. To this end, and in order to secure the benefits of the long and varied electrical manufacturing experience of the General Co. on the one hand, and the operating experience of the Marconi Co. on the other, a new company has been formed, known as the Radio Corporation of America, in which both the G.E. Co. and the Marconi Co. have accepted a considerable participation.

In the report of the company for the year ending December 31st, 1918, reference was made to the incorporation of the International General Electric Co., Inc., for the purpose of taking over the assets, investments, and activities of the company in foreign countries, covering manufacturing, selling, engineering, utility enterprises, &c. In accordance with that announcement the company subscribed for the entire capital stock of the International General Electric Co., Inc., consisting of $10,000,000 of 7 per cent. preferred stock at par and $10,000,000 of common stock at 110, paying therefor the sum of $21,000,000 cash (part before December 31st, 1919, and the balance in January, 1920), and sold to the International General Electric Co., Inc., securities and accounts of like value.

The widespread and diversified interests involved have prevented the completion, at December 31st, 1919, of all of the transfers and therefore this report combines, for the sake of convenience, the assets and liabilities of the International Co. with those of this company.

The Swedish Ericsson Co.

The report for 1919 of the directors of the Allmänna Telefon Aktiebolog L. M. Ericsson states that the reserve which was manifested on the cessation of the war continued during a large part of last year, and the demand for manufactures only increased in the second half, when orders arrived in greater abundance. As a result of the keen competition in the world's markets, it was impossible to keep sale prices on the level demanded by the high costs of production in Sweden. The company had orders on hand at the beginning of 1920 for 10,000,000 kr., and orders had been plentiful since, whilst in the matter of prices the changed conditions in the most important foreign labour markets seemed recently to have reduced the difficulties of the Swedish export industries to some extent. Work at the Stockholm shops proceeded without disputes during the year, the number employed there having risen from 1,296 to 1,359 at the end of the year; and a total bonus of 1,146,000 kr. was paid to the personnel to meet the increased cost of living. The value of the deliveries from the workshops amounted to 15,770,000 kr., as compared with 12,750,000 kr. in 1918; 10,840,000 kr., or 68.7 per cent. of the former represented exports, as against 7,550,000 kr. and 59.2 per cent. in 1918.

A new subsidiary company had been formed in Holland which, together with the Dutch colonies, had become one of the company's principal markets in recent years. The largest customers were composed of State and municipal authorities, who had set up a strong demand that at least some of the telephone material should be manufactured in the country, having regard to the increased purchases which were being made. In order to meet this demand the directors accepted an offer made by a competitive undertaking in Holland to take over the business, and for this purpose a Dutch company was constituted with the Swedish company holding the majority of the share capital. The decision to this effect was reached last autumn, but the business was only taken over at the beginning of 1920. The factory could not occupy more than 150 workmen, but it would be able advantageously to carry out some of the work which formerly involved high freight and Customs charges, and good possibilities existed for its future extension. Coming to consider the South American markets, the report mentions that the importance of sales there had considerably increased during the war, and the directors considered that the markets ought to be worked in a more direct and energetic manner than could be done through local agents. For this purpose a branch was established in the middle of last year at Buenos Ayres with the object partly of carrying on direct sales, and partly of undertaking the construction of telephone installations and acquiring telephone concessions. During the short time of its existence the branch had not been able to show big results, but judging from everything South America would become a specially good market for the company's manufactures. The activity of the branch had hitherto been limited to Argentina and Uruguay, but the intention was also to cover the remainder of South America, particularly Chile and Brazil.

After dealing with the subsidiary companies in Petrograd, London, Austria, Hungary, Buffalo, U.S., Paris, and Finland, the report returns the net profits at 3,750,000 kr., as against 3,740,000 kr. in 1918. The directors recommend a dividend at the rate of 5 per cent., this contrasting with 6 per cent. in the previous year, when the share capital participating was 61,500,000 kr., as compared with 73,250,000 kr. at the end of 1919.

The Austrian Cable Works and Wire Industry Co.

The directors of the Kabelfabrik und Drahtindustrie A.G., of Vienna, reporting on the year 1919, state that it was only possible partly to utilise the capacity of the works, as was also the case in recent years; raw materials were more difficult to obtain owing to the separation of the individual States in Customs and transport matters, and even some departments had temporarily to cease working altogether. At the end of the year the stocks in Vienna showed an increase as compared with the close of 1918, as it had been possible for the company to acquire various materials in connection with the demobilisation, for which payment was made in war loan, which was also utilised for the payment of the war tax. Relatively favourable results were obtained both by the Zoptau & Stefan Mining & Ironworks Co., and the Corinthian Iron & Steel Works Co. The authority given a year ago to raise the share capital to 10,000,000 kr. by the issue of 9,000 shares of 200 kr. was exercised in January, 1920, and the result of the issue, through which the company's own funds were increased by approximately 9,000,000 kr., would be brought into the accounts for the new financial year. After writing off 986,000 kr. for depreciation, the net profits are returned at 3,815,000 kr., which sum is reduced to 3,606,000 kr. by a payment made to the Pressburg Cable Works Co. under the joint profit equalisation contract between the two companies. The balance forward from 1918 brings the total amount available for disposal to 4,005,000 kr., and the dividend is at the rate of 18 per cent., or 36 kr. per share, on a share capital of 8,200,000 kr.

Arbroath Electric Light & Power Co., Ltd.—The profits for the year amounted to £3,628, plus £484 brought forward. The directors recommend a dividend of 7 per cent. on the ordinary shares, which carries an increase of 1 per cent. on preference shares. The year was a prosperous one for the company. A large number of new consumers have been connected up within the last few months, and at the present time the demand is greater than the present installation can supply. It will be necessary to lay down additional mains before next winter, and further engine power and other plant will also be required soon. The expenditure will necessarily be heavy, but the prospects are excellent, and it is proposed by the directors to increase the capital to £100,000, divided into 10,000 £1 5 per cent. preference shares, participating up to 6 per cent., and 90,000 £1 ordinary shares.

Lancashire Dynamo & Motor Co., Ltd.—Dividend 10 per cent. on the ordinary shares, tax free.

West India & Panama Telegraph Co., Ltd.—Interim dividends were paid in November last on the first and second preference shares at 6s. per share, leaving £10,033, which the directors think should be carried forward to the current year's account. According to the *Financial Times* the year 1919 was the most disastrous in the company's history, the primary cause being the unprecedentedly long delay of the cable-steamer, the *Henry Holmes*, at Trinidad in undergoing her third survey. In the first three months of this year the loss of traffic is estimated at £18,000. Every effort has been made to obtain the services of cable-steamers of other telegraph companies, and on three occasions the efforts were successful, but for short periods only. An opportunity having recently offered, it was decided, notwithstanding the expense, to charter a cable-steamer for five months, and it is hoped in that time to restore several, if not all, of the most important sections.

Stock Exchange Notices.—Application has been made to the Committee to allow the following to be officially quoted:—

English Electric Co., Ltd.—1,431,509 ordinary shares of £1 each, fully paid (Nos. 1 to 1,431,509); and 552,528 6 per cent. cumulative preference shares of £1 each, fully paid (Nos. 1 to 552,528), and £1,000,000 5½ per cent. sinking fund first mortgage debentures.

Submarine Cables Trust.—4,200 coupons of reversion (Nos. 1 to 4,200).

The Committee has specially allowed dealings in the following under temporary regulation 4 (3):—

Callender's Cable & Construction Co., Ltd.—400,000 ordinary shares of £1 each, fully paid (Nos. 1 to 400,000); and 400,000 6½ per cent. cumulative preference shares of £1 each, fully paid (Nos. 1 to 400,000).

Greenwood & Batley, Ltd.—96,000 7 per cent. cumulative preference shares of £1 each, fully paid (Nos. 1 to 96,000); 168,000 ordinary shares of £1 each, fully paid (Nos. 1 to 168,000); and 174,195 new ordinary shares of £1 each, fully paid (Nos. 180,391 to 354,585).

Para Electric Railways & Lighting Co., Ltd.—5,000 6 per cent. cumulative preference shares of £1 each, fully paid, (Nos. 320,001 to 325,000).

The Committee has ordered the undermentioned to be officially quoted:—

Para Electric Railways & Lighting Co., Ltd.—5,000 6 per cent. cumulative preference shares of £1 each, fully paid (Nos. 320,001 to 325,000).

West London & Provincial Electric Supply Co., Ltd.—Mr. H. Kahn presided at the annual meeting last week. He said that the balance at profit and loss of the West London showed an increase of £1,151 over that of last year, chiefly due to the fact that they received 7½ per cent. dividend on their shares in the Chiswick Corporation, as against 6 per cent. last year. Out of £4,716 available for distribution, they proposed to pay a dividend on the cumulative preference shares of 6 per cent., less tax, and the interest in arrear for the years 1914, 1915, and 1916 of 4½ per cent. per annum on the funding certificates, the balance of £251 being carried forward. He had reason to hope that, barring unforeseen circumstances, this time next year they would be able to wipe out the remaining arrears of interest on the funding certificates. The results both at Chiswick and Aberystwyth had shown an improvement. The outlook for the year 1920 seemed quite good, in view of the results already obtained, but, naturally, with the uncertainty of prices both for fuel and labour, it would not be safe to be to optimistic.

Altrincham Electric Supply Co., Ltd.—A dividend of 7 per cent. per annum on the ordinary shares is announced.

Submersible Motors, Ltd.—Mr. B. T. Rumble presided at the annual meeting held at Southall on May 12th. He said it was not possible to lay the accounts before the meeting as they were being audited. The negotiations with the Admiralty as to prices had been completed, and the meeting would be adjourned until the amount of the company's liability for excess profits was known. In the meantime an interim dividend of 5 per cent. for the year ended March, 1919, was being paid. In the fire of November last they lost the whole of the records of the work in progress in the shops at the time. Until the whole of the amount of the loss on all items was known the insurance companies refused to deal with any part of the claim.

Prospectus.—*Aster Engineering Co. (1913), Ltd.*—This company is offering for subscription (May 28th is the closing day) 100,000 8 per cent. cumulative participating preference shares of £1 each at par. The capital is being increased to provide funds for the purpose of additions which are now being made to the existing works and equipment for the execution of the increasing volume of profitable business. Over 30,000 Aster engines are already in use, and many of them have been at work for 12 to 15 years; a considerable and increasing business is now growing up in the manufacture of spare parts and renewals.

Fellows Magneto Co., Ltd.—The report for 1919 states that, after allowing £4,615 for depreciation, &c., there is a net profit of £22,644. The 8 per cent. dividend on the cumulative participating preferred shares for 1918 has been paid, absorbing £9,255. The directors recommend a participating dividend at the rate of 1½ per cent. per annum, less tax, on the preferred shares, making 9½ per cent. for 1919, and a dividend of 25 per cent., less tax, on the ordinary shares. £5,772 is to be carried forward, subject to excess profits tax.

Tramways (M.E.T.) Omnibus Co., Ltd.—According to the *Financial Times*, the accounts for 1919 show that, after providing for the service of the debenture stock and for income tax, &c., and including £15,000 transferred from reserve, the credit balance of £1,055 brought forward is converted into a debit of £7,265.

Rhondda Tramways Co., Ltd.—Dividend 8 per cent., less tax, on the preference shares on account of arrears (from 1914 onwards); £8,000 to reserve and renewals; £25,694 for repairs and maintenance; £1,280 carried forward.

Loughrea, Co. Galway, Electric Power & Lighting Co.—Dividend at the rate of 5 per cent., free of tax, for the past year.

Submarine Cables Trust, Ltd.—The report for the year ended April 15th, 1920, states that the revenue amounted to £26,259 and the expenses to £1,820, leaving a balance of £24,438. After providing £12,372 to meet payment of the coupons, the sum of £12,066 has been transferred to the redemption fund; £66 is carried forward.

Puebla Tramway, Light & Power Co.—A meeting of holders of the first mortgage 35 year 5 per cent. gold bonds is called for June 15th, in London, to consider proposed modification of their rights.

Dudley, Stourbridge & District Electric Traction Co., Ltd.—Dividend of 4 per cent. on the ordinary shares for 1919. £1,000 to reserve; £2,000 to renewals; £65 carried forward.

Johnson & Phillips, Ltd.—The financial Press states that the recent issue of 87,500 £1 ordinary shares was largely oversubscribed.

Siemens Bros. & Co., Ltd.—Final dividend of 1s. per share, free of tax, making a total dividend of 10 per cent. per annum, free of tax, for 1919.

Oldham, Ashton & Hyde Electric Tramway, Ltd.—Dividend of 6 per cent. for the year 1919 on the ordinary shares.

Nairobi Electric Power & Lighting Co., Ltd.—Final dividend of 2 per cent., making 10 per cent. for 1919.

STOCKS AND SHARES.

TUESDAY EVENING.

THE course of the Stock Exchange markets never runs smoothly when politics interfere with it. The Chancellor of the Exchequer is accused of not knowing his own mind sufficiently to make him definite on the point of what taxation shall be imposed, and what dropped. Flirtation with the question of a War Wealth Levy is one of the factors which make, at the present time, for hesitation and uncertainty in the Stock Exchange markets. The effect of this is felt all round. The man of wealth, not knowing where he is to be attacked, sells a little stock by way of precaution. The Stock Exchange man, fearing that War Wealth taxation will bring a lot more securities to market, puts down prices in case this may happen. The whole of the House is affected by these considerations, while amongst industrials, the outlook is darkened by the new difficulties which seem likely to spring up in Labour circles as one result of the rise in coal.

Electricity Supply shares are heavy by reason of this latter cause. Charing Cross, City Lights, Westminster, Kensington and County of London ordinary shares are down ⅛ to ¼. The preference shares remain unchanged. Amongst manufacturing issues the same tendency prevails. Electric Constructions and Cromptons are both lower. In the cable group, Henley's lost 1/16. Elsewhere, Castner Kellner developed flatness on selling from the North, and the price dropped to 3¾.

Eastern Extensions and Eastern Telegraph ordinary are quoted ex dividend, and the former at 15 offer a yield to 6¾ per cent., dividends being paid free of tax. A Bill giving the U.S. Secretary of State the right to license all cables landing on American shores has been introduced at Washington. Its sponsor claims that American cable communications with South America were being hampered by a Brazilian grant of exclusive rights to an English company to operate cables in its territory. The Stock Exchange market views the matter without concern. Oriental Telephones have eased off to 2⅞; the dividend is raised from 10 per cent. to 12 per cent., tax free, of which 2 per cent. is declared by way of bonus. West India and Panama ordinary have fallen to 12s. 6d., and both classes of preference weakened. The recent report is not relished. Marconis went back to 3 before rallying to 3⅛. Marconi Marines are flat at 37s. 6d.

Urban Electric preference were not immediately affected by the passing of the dividend, as mentioned here last week, but shares came to market later on at 22s. 6d., at which price they were taken. The ordinary are quoted about 6s., and could perhaps be bought for rather less. Edmundson's ordinary stand at the same level, and the 6 per cent. preference last changed hands at 43s. 1½d. These, like the Urban preference, are of the nominal value of £5, and are fully paid. The ordinary of both companies are £3 shares, also fully paid. River Plate Electricity ordinary stands at 105 ex dividend and bonus. Victoria Falls preference are better at 20s., the 5 per cent. first debentures are 94½, and the Seconds 102¾, while the ordinary, in which there is not much market, stand at 12s. English Electrics remain fairly steady at 20s. 9d. British Aluminium new ordinary are a pound, General Electric new ordinary 29s. 6d., the 7½ per cent. B preference 19s. 3d., and the 6½ per cent. preference have gone back to 17s. 6d.

The Underground Railway group is weak because of the unsettlement—up to the time of writing—amongst the omnibus men. Central London preferred at 45½ is 2 lower. Of other traction issues, Mexicans have improved, on the assumption that any Government other than that of Carranza might make an agreeable change from the chaotic conditions prevailing under his régime. Bombay Electric preference have started to mount again, and are 15s. up at 13½. Brisbane

Digitized by Google

Electric Tramways 4½ per cent. debenture stock is quoted higher at 94. Under the Trust Deed the stock becomes repayable at 100 on January 1st next, and a full year's interest will have become due by then. This would look a "dead-snip" for the investor were it not for the lurking doubt as to the redemption being carried out at due date.

Metropolitan-Vickers ordinary are firmer at 27s. 6d., and the preference retain their last week's advance at 25/16. Armament and engineering shares show a dwindling tendency. A fall of 2s. 6d. lowered Babcock & Wilcox to 2¼. The rubber market went down sharply in company with the raw material, but recovery from the worst ensued.

Before the war, one of the best reference books available in connection with electric lighting and traction was Atkin's "Manual," privately published by a well-known Stock Exchange firm for circulation amongst their friends and fellow-members. The volume has made a welcome reappearance, and is a power-house of information. How up to date it is may be exemplified by the details of the British Electric Transformer's new issue of 137,500 7 per cent. preference (at 17s. 6d.) and 162,500 ordinary shares (at 24s.) made last month. The English Electric Company's figures for 1919, which were announced in April, are duly shown, the ordinary receiving 8 per cent. dividend, £100,000 going to capital reserve account, £133,045 expenses written off, and £45,301 being carried forward. Mention is made of the General Electric's offer, in March last, of 400,000 new ordinary at 28s. and £1,600,000 new 7½ per cent. B preference shares at 20s., existing holders being offered at the same time the right to subscribe for one new ordinary share at 28s. in the proportion of one new for every three old shares held. The "Manual" is in other respects fully up to date, and is admirably produced.

Electric Furnaces. — Mr. C. H. Booth describes in *Canadian Machinery* a new type of cylindrical rotating arc furnace of moderate size for dealing with brass and other non-ferrous metals, for which the advantages are claimed of even distribution of heat with consequent long furnace life and low loss of zinc by vaporisation. The furnace, which is made in sizes from 200 to 3,000 lb. capacity, consists of a lined cylindrical body with horizontal axis resting on rollers driven through gearing by an electric motor. The two electrodes project through water-cooled apertures in the end plates and the single-phase supply is taken to them by contact rings on the rotating body. Hand regulation is used in the smaller sizes, but the largest furnaces are fitted with automatic gear. The lining is cleverly contrived with as few joints as possible, and can be renewed without much difficulty. The charging door at the end of the furnace is hinged like the breech-block of a gun and swings back with the electrode in its centre and all the electrode gear. Before pouring, the furnace is stopped with the tap hole at the top, when it is opened by picking out the sand plug with a pointed tool, and the furnace is slowly rotated until the metal begins to pour. The movement can be controlled to a nicety due to the electrical drive. Thirty to forty minutes are required to melt a charge, and with a small furnace the energy consumption is about 300 kw.-hours per ton. From 600 to 1,000 heats are believed to be obtainable without relining, and the electrode consumption in a 250-lb. furnace, fairly constantly employed, averages 31 lb. per ton.

A novel device described in the *Iron Age* is a tilting mechanism for removing a furnace roof when charging. The furnace, as constructed by the Industrial Electric Co., Chicago, is mounted upon rocker-arms, and the roof is suspended from a frame which is tilted by a rack and pinion. All electrical connections are under the platform of the furnace. The motors for controlling the electrodes are mounted on the back of the roof frame. When the roof is tilted back the most bulky scrap can be dropped directly into the furnace as cold stock, pre-heated scrap, or melted metal. The furnaces are built in 2, 4, and 7-ton capacities, and are arranged for two or three-phase current.—*Technical Review.*

PERMANENT MAGNETS IN THEORY AND PRACTICE.

By S. EVERSHED, M.I.E.E.

[*Résumé of paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.]

REFERRING to the difficulty of compressing the paper, which represented the work of 20 years, into the time available, the author made no attempt to read it, but delivered an exceedingly interesting lecture on its contents, of which the following is an outline :—

Ampère suggested that the magnetism of a permanent magnet was due to electric currents flowing in molecular circuits; this hypothesis was now accepted, and Ewing's theory of the interactions between neighbouring magnetic molecules with its aid fully explained the phenomena of the cyclic curve of magnetisation. The electron theory showed how the Ampère elements were constituted, consisting of a system of electrons moving with very high velocity in orbits round a nucleus; the existence of the molecular currents would be assumed, but for simplicity the molecule with its system of electronic currents would be represented by an imaginary circuit or "current ring," carrying a permanent and constant current, and behaving magnetically like the actual molecule. It was assumed that the rings were immersed in the universal magnetic medium of space.

Magnetisation of iron was effected by turning the molecules so as to co-operate, by the application of an extraneous magnetic field, which applied an orienting torque to the current rings (it did not "magnetise" anything). On removing the applied field, the mass of current rings was left in a more or less oriented condition, defined by their orientation angle θ. The magnetised iron would now possess an inherent magnetomotive force F in the direction of the field, the oriented mass of rings creating induction in that direction.

Ohm's law held good in the magnetic as in the electric circuit. An electric current could be changed by changing the resistance in the circuit, or by making an addition to the electromotive force. In a short-circuited battery of electromotive force E and resistance R the current $I_1 = E/R$—here called the "self-absorbed" condition. If now an external inert resistance r were added to the circuit (an "extended" circuit), the current would be decreased, requiring less E.M.F. to maintain it in the original resistance R, and setting free a surplus motive force which, when equilibrium was restored, would just suffice to maintain the diminished current in the external resistance r, so that $I_2 = E/(R + r)$, or if $V = I_2 r$, $E = I_2 R + V$. Or the current may be equally diminished by inserting an opposing E.M.F. e in the circuit, when $I_2 = (E - e)/R$ or $E = I_2 R + e$. It would be seen that $V = e$, or the opposing motive force applied to the self-absorbed circuit to produce the same change must be numerically equal to the surplus motive force set free in the extended circuit, but of opposite sign.

The statement was equally true for complete magnetic circuits, whether containing iron or not, because in the magnetic medium there was strict proportionality between motive force and flux. On the hypothesis of molecular currents and one universal magnetic medium, the word "permeability" ceased to have any meaning. The author showed that, as in the case of the electric circuits, so in a magnetic circuit the flux could be diminished either by extending the circuit, or by applying an extraneous motive force in the negative direction without altering the circuit. In the former case (extended circuit) he obtained the numerical relation $F = \beta + \phi$ where F = inherent magnetomotive force per cm., β = the magnetic induction, and ϕ = the surplus magnetomotive force not required to maintain the flux in the magnetised body itself. In the latter case (self-absorbed circuit) he obtained $F = B + H$, where H was the extraneously applied motive force, and B was the resultant flux density, due to the combined action of F and H per cm. If H were chosen so that $B = \beta$, and F the same in both cases, it followed that $\phi = H$; for equal change in the magnetic flux, the positive surplus motive force per cm. of steel in the extended circuit was numerically equal to the negative extraneous motive force per cm. of steel applied to the self-absorbed circuit.

After showing, on the basis of known and assumed electronic data, that the electron theory would fully account for the magnetomotive force inherent in iron (which was equivalent to a magnetising force of 17,000 ampere-turns per cm), the author proceeded to discuss the design and predetermination of permanent magnets. The function of these, he said, was to maintain magnetic energy in some particular space such as an air-gap. The primitive equations were, for terminal flux, $B = \beta A$, and for terminal potential difference $V = \phi L$. The magnetic energy was BV. To predetermine the characteristics of a magnet it was first necessary to determine the B H curve of demagnetisation of the steel. A typical curve for tungsten magnet steel was shown (fig. 1) in which B = flux density, and H the extraneously applied motive force per cm., to which ϕ, the surplus motive force, was numerically equal. Neglecting leakage, and denoting the length and sectional area of the core by L and A respectively, the relations between the factors of energy B and V and the dimensions of the magnet were $B = \beta A$ and $V = \phi L$. Any flux density β might be chosen, and by making $A = B/\beta$, the core would deliver the desired terminal flux; and if the corresponding value of ϕ were taken, by making $L = V/\phi$, the required terminal potential difference would be provided. But if economy of steel or of space were aimed at, such haphazard design would not serve. The energy requirement must be taken into account. The energy equation was obtained by multiplying the two primitive equations together, $BV = \beta\phi LA$, where BV was the amount of energy maintained in external space by a volume of steel LA in which the flux density had the value β. The product $\beta\phi$ was the available or useful energy per cubic cm. of magnetised steel. The volume of steel = $BV/\beta\phi$ so that to use the least volume of steel, $\beta\phi$ must be a maximum. Its value might be plotted against flux density, as shown on fig. 1, on the right, and the maximum value was then seen at a glance, giving at once the "economic density." The economic dimensions of the magnet core could then be determined by inserting the values of β and ϕ in the primitive equations.

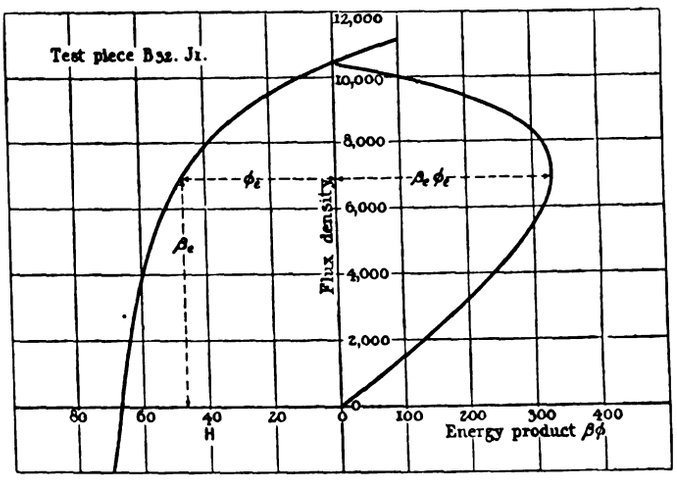

FIG. 1.—Typical demagnetisation curve for magnet steel, showing the derived curve of the energy product $\beta\phi$. N.B.—Numbers on the energy scale when multiplied by $1000/8\pi$ give the energy in ergs.

The author then dealt with the question of leakage, and showed how the formulæ could be applied to the design of economic magnets and the predetermination of their performance, giving examples which showed that a very high degree of accuracy was attainable. In the course of a summary of the paper he said :—

Throughout the paper the underlying purpose has been to gain a clearer view of fundamental matters and to build up a theory of the permanent magnet consistent with present-day knowledge, and readily applicable to the practical problems of design and predetermination.

The gathering together of molecules of equal magnetic moment into concentrated groups need not be regarded as the sole possible mode of departure from uniformity which will endow the mass with the necessary power to form local bonds of mutual induction. Any kind of molecular *variformity* which, in effect, brought about an unequal distribution of the molecular magnetomotive forces, would give rise to a similar state of things. And in view of the increased ability to maintain itself in a partially-oriented state, which iron exhibits when carbon and other non-magnetic substances have been introduced, it seems by no means unlikely that the necessary departure from uniformity may consist in the congregation, in one mass of equally-spaced molecules possessing unequal magnetic moments; some stronger, some weaker, than the average. As a limiting case, we may imagine the presence of non-magnetic molecules distributed throughout a mass of magnetic molecules. Such an arrangement would provide magnetically vacant spaces for the propagation of local fields of mutual induction, in much the same way as the concentrated groups which we have taken as a simple example of variformity.

As a corollary to Ewing's theory, the hypothesis of molecular variformity appears to be necessary to account for the facts of permanent magnetism.

DISCUSSION IN LONDON.

Mr. H. B. ATKINSON opened the discussion, and described the excellent paper as the result of 25 years' work on the part of the author. It would rank as a classic with those papers presented by Hopkinson and Kapp in 1886; it was a monumental work. The paper contained the first clear statement on the subject that had been put before the electrical world. The author's method of predetermination for the purpose of the design of magnets was one that could be used by engineers. The trouble to-day, he thought, was that engineers were not thinking sufficiently in terms of electrons, of electron currents. With regard to the author's statement that the "energy of an electric current being kinetic, any two or more current rings will tend to turn on their pivotal axes in directions which will increase their joint energy" he thought that only held if the energy was maintained constant by external means. Again, the statement that the "enegry of the mass will be increased if any two or more rings turn

Digitized by Google

round until they possess a magnetic axis in common" was erroneous; on the contrary, the energy would diminish, in his opinion, 50 per cent. Those statements of the author referred to what would happen only if the currents in the coils were maintained constant by an external battery and not under other conditions. With regard to the predetermination of a ring magnet by step-by-step integration, the author in this way obtained a number of corresponding values of width of air gap and terminal flux, but the late Dr. S. P. Thompson had shown experimentally that no change in flux whatever accompanied variation of the air gap. These matters were referred to in the tenth Kelvin lecture delivered by the speaker last year. However, the speaker thought that the author's reasoning was correct, and would help greatly to clear up many doubtful points. Both the author's and his own theories, he felt, were correct mathematically, but some change in the interior mechanism of the author's was necessary so that it would conform with experimental facts.

Dr. G. Kapp complimented the author on the extremely able manner in which he had prepared his paper. Their object, he thought, should be to strive to help the steel maker; to tell him how to vary the constituents or the treatment of his materials so that he could produce the desired material. In the early days wrought iron was specified for dynamo magnets, but to-day he thought that Sheffield could say that it had produced cast steel which would give equal, if not better, results than iron. He thought it very desirable to formulate a theory that was capable of being put into everyday phraseology, so that they could give the steel-maker the information he required. Further information about the iron-cobalt-carbon-chromium steel mentioned in the paper would be very welcome.

Major K. Edgcumbe thought they were indebted to the author for giving them a classic paper which contained much information of which they had long been in need. They would now be able to deal with iron magnets as easily as they could with coils, but his opinion was that the predetermination of the qualities of a magnet and its design should be kept separate. The author's apparent object of obtaining the maximum possible energy from a minimum volume of steel was good, but was he sure that that method would give the desired permanency? There were two forms of permanency; first, for magnets used in such devices as magnetos, &c.; and secondly, for instrument magnets. The former magnets had to withstand a good deal of vibration, &c., and it was not of much consequence if their total flux decreased slightly, but with the latter type of magnet it was a serious matter if the flux varied by more than 1 per cent. With regard to symbols, some of those used in the paper did not meet with the speaker's approval. Some of them were in exact opposition to those selected by the International Electrotechnical Commission after a great deal of labour, and it was to be regretted that the author had struck out on his own instead of falling into line and adopting the standardised symbols.

Prof. E. W. Marchant said that the paper very clearly explained the position of the subject under discussion. It gave promise of much improvement in magnetic materials. The fact that the atomic weights of all strongly magnetic materials were very nearly the same was of much interest. Some substances, such as maganese and silicon, had the power of destroying magnetism, but could not produce it themselves. The atomic weights of non-magnetic substances differed appreciably from those of magnetic materials, and it would be of much interest to know whether any relationship existed between them. The paper raised hopes of obtaining the required steels by means of heat treatment, or by altering the molecular structure, the tribal arrangement as the author termed it, of the material. The author had shown them how to look at the subject from a new point of view which would be of extreme value.

Mr. H. M. Dowsett, whose remarks were illustrated by lantern slides, said that the very determined effort the author had made to build up a consistent theory of magnetism proceeding step by step from the inter-atomic electron ring to the commercial permanent magnet, would be welcomed by everyone who desired to see physics and engineering practice brought into one consistent scheme of evolutionary development. The weak link in the chain was the character of the inter-atomic electron current, which depended on the structure they postulated for the atom. In order to endow the atom with magnetism it was necessary to assume that the electrons were rotating rings, and were themselves magnetic. Some years ago he attempted to construct an atomic model which would satisfy the requirements of the physicist and of the chemist, and yet would be subject to the gravitational and electrodynamical laws. The principal obstacle in the way was the physicists' assumption, as the result of many experiments, that the total number of electrons in the atom could not very much exceed the number representing its relative atomic weight in the periodic series of the elements, and that the positive charge whose constitution and place in the atomic structure they knew nothing about, must, therefore, be credited with practically the whole mass of the atom. If the whole mass of the atom could be said to be due to the united masses of the electrons—as was at first assumed by J. J. Thomson—and the positive charge and the balance of the electrons above the atomic number could be so arranged in the atom as to be practically insensitive to most means of experimental research, that difficulty would be removed. Proceeding on these lines, the speaker said he had devised a model, which he illustrated by lantern slides, which was able to act electrically, chemically, and radioactively in a manner which could satisfactorily explain experimental results. His present object was to show that it was possible to devise a simple type of atom which conformed to the laws of electrodynamics, and also afforded a reasonable basis for a complete theory of magnetism which would start with the constitutional movement of the electrons in the atom.

Mr. A. P. Young, in congratulating the author on his work, said that they had imagined that they had discovered something new when during the past five years they began to plot betaphi curves in order to judge the quality of magnet steels, and to apply the product curve to the design of a permanent magnet. The author, however, told them that he had first used the method 18 years ago, which showed how far behind they had been. It was curious that although an alloy of three parts iron to one part nickel produced a non-magnetic metal, when heated to a temperature of 1,000 deg. and cooled in air the substance immediately became magnetic. He had recently heard that an American claim was that the permanent flux was improved by magnetising the material at a temperature of 200 deg. below zero. Another interesting metal was the cobalt steel mentioned by the author. The paper would cause them to think about the why and wherefore of such effects as he had mentioned; they had been given a lead, and good results would follow. In the future they needed to think more in terms of the atom when seeking solutions to their difficulties.

Dr. E. H. Rayner said that the paper raised again the question, what was the basis of the characteristic of ferro-magnetism? The modern conception of the atom was a planetary system of electrons, each possessing a charge of negative electricity, gyrating round a central positive system. The number, and perhaps arrangement, of electrons was directly associated with the atomic weight; and, therefore, with the characteristics of the atom, and gave each element its particular properties. In the general case such a system, if the electronic orbits of a single atom were arranged indefinitely in space, would exhibit no magnetic polarity. In order to exhibit polarity there must be more or less concentration of the motion of the electrons into one direction such as existed in the solar system, all circulating roughly in one plane, or at least on the surfaces of something like cylinders. An atom, or system of atoms, which possessed a polarisation of such a type, would in general have its external field largely neutralised by neighbouring ones, as they would tend to line up so as to produce a closed field. In order to exhibit polarity in the mass, it would appear necessary that, under the influence of an external field, for instance, the motion of the individual electrons in large numbers of atoms must be induced to rotate about axes more or less parallel. It was possible that in many atoms there was some particular constraint, associated with the distribution of electronic motion, which prevented the action of an external field producing this orderliness of motion necessary for the production of general magnetic polarisation. Such bodies would be non-magnetic. This would also be the case if, in spite of orderliness being part of the nature of the electronic motion in the atom, the constraint were due to the arrangement of the molecular or larger aggregation. There remained the crux of the problem, if such ideas corresponded to anything approaching the structure of the atom, how to explain why iron was almost unique in its properties. The electronic theory differentiated atoms of the various elements largely by the number of electrons in the atom. If they had a system of N^3 electrons, or electronic systems, it was possible to arrange such a number of electrons in very simple symmetrical systems, which might be illustrated by the corners of a cube which had 2^3 corners, or by the sides of an octahedron which had 2^3 sides. A similar symmetry was obtainable if they had $m \times 2^3$ systems. The atomic weight of iron was about 5 6, or 7×2^3, and it might be that this chance possibility of a peculiar symmetry endowed the atom and its agglomerates with the properties of ferro-magnetic bodies. There was also a peculiar symmetry associated with the number 7. For instance, a regular hexagon was formed by one central point and six surrounding it at equal distances from the centre and from each other. Such a system might be regarded as composed of six equilateral triangles, and such a figure in one plane could only be formed by a 7-point type of symmetry. The other elements which exhibited magnetic properties, and which, alone, or associated with certain other elements, as in the case of manganese in the Heusler alloys, were all very close to 56 in atomic weight as Prof. Marchant had stated. The four, manganese, iron, nickel, and cobalt lay between 55 and 59, while there was a relatively large jump to chronium 52 below, and to copper 63 above, both of which were non-magnetic. If they assumed that electronic number distribution determined atomic properties, including magnetism, then it would appear that atomic weight, which was associated with electronic number, must govern such things as magnetic properties, and magnetic properties must be the result of something dependent upon number and probably upon a peculiar symmetry associated with number.

Colonel R. E. B. CROMPTON, C.B., welcomed the paper as an epoch-making one, and said it reminded him of the old days. The discussion would not end that night; the paper would continue to be discussed by electrical engineers the world over for some considerable time to come. It had given him keen delight to send copies of the paper across the water to Dr. Steinmetz and others, to show them that they were still capable of doing things in this country. He, however, wished the author had adopted a different course with regard to the symbols he had used. There was no reason why he should have selected a new set when there already existed an international set.

Mr. S. EVERSHED, in his reply, said it was impossible to reply to the discussion in the time at his disposal, and he, therefore, reserved his full reply for publication in the Institution *Journal*. He would feel that his work had not been in vain if the paper, as Mr. Young had said, would start other men thinking, and lead to something being done. It was not permissible to discuss the Kelvin lectures, and they had, therefore, not had the opportunity of pointing out the fallacy in Mr. Atkinson's argument. With his theory it was difficult to see how there would be any magnetism at all, and there would certainly be no permanent magnetism whatever. The speaker felt that there must have been something wrong with Dr. S. P. Thompson's experiment mentioned by Mr. Atkinson. The flux variations were so small that unless the experiment were made with extraordinary accuracy they were liable to escape notice. Finally, the author defended the use of his own set of symbols in preference to the international ones selected by the International Electrotechnical Commission.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Trading Restrictions.

Referring to a letter headed as above and signed "Interested," which appeared in your issue of the 30th ult., I have pleasure in sending herewith replies to the writer's questions:—

1. Can any contractor stock, advertise, or sell lamps which are not controlled by his Association? (Viz., E.L.M.A.)

Yes, excepting as provided for in answer to the second question.

2. Can any graded retailer stock, advertise, or sell metal filament lamps of any other than Association makes?

A graded retailer agrees not to advertise, stock, or solicit orders for lamps of non-Association make in return for special discounts over and above trade terms, but may sell such lamps on demand.

The writer quotes the following clause from a retailer's agreement:—

"We agree not to advertise, stock, or solicit orders for metal-filament lamps of any type or group of other than Association makes (as set out in previous page)."

This clause means exactly what it says. A graded retailer may supply non-Association lamps in fulfilment of an order received by him, but in consideration of special terms agrees not to push the sale of other than Association lamps. If a contractor wishes to reserve the right to advertise, stock, or solicit orders for non-Association lamps then he can do this and still buy Association lamps at ordinary trade terms.

J. E. Edgecombe,
Director,
Electric Lamp Manufacturers' Association of Great Britain, Ltd.

London, E.C.
May 11th, 1920.

City of York Advertisements.

With reference to the York advertisement and the comments in your issue of May 7th, I am glad to see that someone has raised the question of salaries of staff engineers, and I am quite in agreement with your correspondents. As they state, present salaries are a poor return for time and money spent in technical training.

The manual workers are in a much better relative position, because years ago they realised the value of co-operation. Individual effort, however praiseworthy, is not much use. The Electrical Power Engineers' Association has for the past two years done its best to improve the status of staff engineers, and has at last secured consideration of our claims.

Should this letter come to the notice of staff engineers who are not members, I would ask them seriously to consider whether they wish to go on taking benefits for which they have not worked, and towards the attainment of which they have not contributed? Association means strength. Remember the bundle of sticks.

Join the Association now. Work for it. Don't be content until every available man in your station is a member.

Sic Itur.

Emergency Braking.

A short while ago, there appeared in your "Correspondence" columns a series of letters dealing with the emergency braking of an electric street car.

If the mechanical and magnetic brakes had failed, and by some means such as a section breaker opening or the trolley leaving the wire, and thereby cutting the line current off, it was necessary to stop the car, one would proceed by opening the main switch, placing the reversing lever of the controller in the reverse position, and feeding up to the first parallel notch. This method will, without a doubt, stop the car, assuming that both motors are working.

But supposing that previously there had been a defective motor, and that it had been "cut-out" in the controller, then the braking effect would be nil. For it will be seen that when both motors are in operation they are acting as generators, and as such they are revolving in opposite directions, and they will, through the medium of a controller, tend to pull each other up, thus giving a powerful electric braking effect. But when there is only one motor working, and the other is electrically cut out, there will be no effect. I have tested this method on a car equipped with Westinghouse type T.I.C. controllers and Westinghouse type 323 motors.

It would be exceedingly interesting if someone could suggest a method of stopping a car assuming the above conditions.

C. E. Slack.

Chesterfield.
May 13th, 1920.

Battery Symbols.

Surely "Eau Delun" (ELECTRICAL REVIEW, May 14th), on second thoughts, will realise that his reference to "the negative (zinc) as the element having no standing" casts an undeserved slur on an *element* which not only is *positive*, but is, in truth, the fuel, and to a certain extent the veritable source of the cell's energy, in generating which, it (the zinc) is gradually consumed.

The very same energy which, in circuit tracing, is referred to as leaving the battery at the *carbon* or *copper* or *positive pole*, is due to the self-sacrifice of the *zinc*.

Outside the cell, the *carbon* or *positive pole* gets all the credit for the *zinc* or *negative pole's* hard work. However, for simplicity in circuit tracing, it is advisable that this somewhat paradoxical convention be adhered to.

This reminds me of a tragic episode long ago in the late seventies, before inspiriting *theory* had—in certain quarters—been to any great extent called in to vitalise stolid *practice*.

What in these days would be described as a frantic S.O.S. once reached me from a distant official. He had been ordered by H.Q. to make some tests with a fair number of Leclanché cells sent out for the purpose—a class of battery he had never before seen, his previous experience having been confined to Minottos—a kind of Sawdust Daniell, a cell of the "constant" type.

In those days, when Minottos were set up, it was customary to use water with which to soak the sawdust; the necessary sulphate of zinc in solution being subsequently obtained by the simple process of short-circuiting the battery on itself for something like 24 hours.

Our friend having set up the Leclanché's, had straightway short-circuited them, and, 24 hours later, was mystified and aghast to find that the zincs had melted into airy nothingness. They had vanished.

E. R. B.

The Policy of the E.P.E.A.

May we be allowed the hospitality of your columns to refer to the published statement of policy during contemporary industrial disputes issued by this Association in February, 1919.

The National Executive Council of the Electrical Power Engineers' Association in December last unanimously agreed to rescind this policy because of its incompatibility with the other functions of the E.P.E.A. as a protective organisation.

Considerable misunderstanding is arising on account of the prevailing impression that this policy is still being adhered to by the Association, and in order to remove the misapprehension, we take this opportunity of notifying its rescission.

W. Arthur Jones,
General Secretary,
Electrical Power Engineers' Association.

London, W.C.
May 18th, 1920.

[The statement of policy was published in our issue of February 28th, 1919, p. 231.—EDS. ELEC. REV.]

Electricity on the Farm.—A Spalding farmer, Mr. F. W. Farrow, has had plans of cottages for his workpeople approved by the Ministry of Health, and 40 cottages are to be built forthwith on bungalow lines. According to the daily Press, telephones are to be installed in each house, which are also to be electrically equipped throughout.

Digitized by Google

A VISIT TO LOUGHBOROUGH TECHNICAL COLLEGE AND THE BRUSH WORKS.

THE members of the South Midland Centre of the Institution of Electrical Engineers were very fortunate in their choice of a day for their visit to the Technical College and the Brush Electrical Engineering Co.'s works at Loughborough last week. About ninety availed themselves of the opportunity, and the bulk of these came by motor omnibus from Birmingham, a four hours' journey. The main party arrived at the college shortly after 11 a.m., and the tour of inspection commenced at about 11.30. Small detachments of about eight visitors were put under the guidance of various members of the staff, who, with the greatest courtesy, replied to the various questions fired at them practically continuously. The first section of the college which came under notice was the cabinet-making department. Here, in what was originally a chapel, some beautiful work was being turned out by a number of ex-service men, who showed by actual results that at least one educational scheme was of great practical value. In one bay of this building one caught sight of a splendidly-finished bookcase, and a great variety of other furniture stamped with the hall-mark of good material and workmanship—dressing-tables, wardrobes, and bedsteads—also called forth admiration from the visitors.

Leaving the building, the party had to traverse a street or two to reach the next department. (Owing to the central position of the institute extensions cannot be made to the main building, and in consequence several other buildings within a short distance of the body of the college have been taken over.) This was the first of the machine shops, and the main item of interest was the gear shaping and cutting work being done there. The smithy was next visited, and a demonstration given on a pneumatic hammer in the centre of the shop. The three forges were hard at work, and the shop, although small, had a remarkably efficient appearance. Upon entering the heavy lathe shop the most noticeable features were a large variable-speed lathe, and another upon which hand-wheels were being turned up. The visitors were shown some good examples of elliptical collars and eccentrics in steel and brass made upon the latter machine. The next room to be seen was the automatic grinding and polishing department, where eight or nine machines were running. In the next shop, where screws were being manufactured, the party inspected some highly finished machine vices of very sound and accurate construction, and the guide stated that a large contract for these vices was being executed for Messrs. Alfred Herbert, Ltd. Every screw turned out is thoroughly tried on a special testing device, indicating by means of a pointer on a dial any inaccuracy in the thread. Welding by the electric arc, and also by oxy-acetylene apparatus was being carried out in the welding shop. The electrode in use was a silica-asbestos covered soft iron wire with a fine thread of aluminium incorporated. In the heat-engine testing shop the party were shown a six-cylinder optical indicator in course of construction, with which indicator diagrams will be taken simultaneously from six cylinders by means of a tube and diaphragm arrangement oscillating a small mirror which projects a beam upon a photographic plate. A demonstration of the principles involved was made upon a single-cylinder J.A.P. motor. A Daimler and an 80-H.P. Le Rhone aero engine were started up for the visitors' benefit, which left them rather deafened. Resistance and gas furnaces were then inspected, and the party next entered the X-rays room, where photographs of inspected work were exhibited. One or two sound-looking joints were shown to the party, and when the rays were applied the way in which the joints had been patched up was very forcibly brought out. Some very beautiful and costly photomicrographic apparatus was seen in the next department, and in the same room samples of iron were being subjected to heating and cooling tests by means of a small resistance furnace, a thermo-couple, and a temperature indicating mirror scale. As the allotted time had then reached its conclusion the party was forced to terminate the inspection, and passing through a nicely appointed students' reading-room, arrived at the dining hall at 1.30 p.m., where luncheon was efficiently served by the kitchen staff.

Dr. GARRARD, on behalf of the members of the South Midland Centre, rendered thanks to the Principal for his hospitality and for the opportunity given to members of seeing such a splendidly equipped institute, remarking that it was not his first visit to the college.

Mr. ROGER T. SMITH (President I.E.E.), in seconding Dr. Garrard's vote of thanks, said that he would extend it by offering the appreciation of not only the South Midland Centre but of the whole Institution.

Responding to the vote, Mr. H. SCHOFIELD, M.B.E., explained that the enterprise was started with a great deal of misgiving as to its success, but he was glad to say that it had more than justified its existence. The college, he said, was based on an American idea of bringing education and experience into closer contact, and followed the lines of similar institutions at Worcester (Massachusetts) and Cincinnati. The greatest proof of its practical value was afforded by the fact that engineers, men who knew the kind of training required, were sending their sons and other relatives to Loughborough. The usual complete course was for five years, but a shorter course of three years, had also been arranged. The college had been organised on a commercial basis, and all products were sold at prevailing market prices, and contracts had been entered into with several firms for the supply of the articles manufactured.

Mr. W. A. BROCKINGTON, education officer of the Leicestershire County Council, endorsed the Principal's remarks, and said that the County Council educational authorities looked with great pride upon their "child." It then being nearly 2.30, the party had to leave rather hurriedly in order to commence the second part of its visit punctually.

Upon arriving at the Brush works the party was met by members of the company's staff, and was again split up into detachments, and the inspection commenced right away, it being explained that there was a great deal to see in a very short space of time. The works cover a large area, and consequently the inspection had to be carried out at a fairly quick pace, which at times made one wish that it had been possible to allot a greater time to the visit. The first shop entered was the winding department, where was seen the construction of many sizes and types of stators and rotors in various stages of progress. Some of the most interesting features presented to the party in this department were coils, &c., of the largest Ljungstrom turbine-driven generator constructed by the company up to the present time. This is being built to the order of the Midland Electric Corporation, Ltd., and is to have a capacity of 8,000 K.V.A. at 7,500 volts (.6 power factor). It is of the two-phase type, designed to run at a speed of 3,000 R.P.M. Here was also seen a single-phase alternator from the works of the Uxbridge & District Electric Supply Co., which was being rewound for three-phase. The power used in the works is supplied by the municipal authorities of Loughborough, whose supply is 220 volts, three-wire D.C., and so it is necessary to employ a number of machines to convert the supply to meet the needs of the Brush Co. for testing purposes, &c. In the winding shop the party was shown a motor-generator set which is used to test and dry out the coils of every machine before leaving the works. Each phase is tested separately before the machine is assembled. The rotor coils shown to the party consisted of alternate windings of bare copper and copper strip insulated with mica, and impregnated "Empire" cloth. The coils of the stator are made up and completely insulated before being placed in position, and they are wound so as to give the smallest possible potential difference between any pair of conductors. The visitors upon leaving the winding department were taken to a machine shop where the smaller parts of the Ljungstrom turbine were in process of manufacture. Here there were a number of vertical lathes, which were stated to be some of the best in the country. One of the products of this department is the gland fitted to the turbine shaft to prevent the escape of steam. This consists of concentric rings, in which the vents are so small as to permit the escape of only a negligible amount. In the turbine shop, which was next visited, the party was shown the manufacture and assembly of the blades. Lengths of channel-shaped steel strip are passed over drums and ground to a very thin size before being cut into suitable lengths. The rings into which the blades are fitted are mounted on an automatic punching machine, which prepares them for the reception of the blades. The latter are then fitted by hand through a soft metal strip, and are thus supported while being placed in position in the outer rings. When the top cover is fixed, these soft metal supports are sheared out. The cover plates when fitted are cut out in the centre, and are then used for the smaller stages of the turbine—this effects a great economy in metal. A seventeen-stage turbine was on view in this shop, the inner stages of which were arranged axially, and the final stage, catching the exhaust steam, was radial. The heavy machine shop came next on the route, and here the visitors saw the rotors, which are solid forgings, being turned up and slotted ready for the windings. The turbine casings are also machined in this department, and one of the time-saving devices shown to the party was a Lancashire Dynamo Co.'s "quick return" planing machine. The casting being operated upon required three small cuts at distances of from two to three feet. Travelling slowly over the surface of the cut the bed was released at a high speed, falling to low speed again at the next cut. When the third cut had been made the bed reversed and quickly returned to its starting point. The testing department, at one end of the shop, where the machines are mounted on a platform above a standard condenser, has a capacity for the rial of two 1,500-KW. sets, and arrangements are being made for the accommodation of the larger sizes. At this end of the shop were the turbines of a twin-screw vessel undergoing final adjustment. The tramway-car and omnibus department was then visited, and the advancing stages of construction were explained. One outstanding feature of the work inspected was the great amount of bent wood in use which was turned out in splendid condition. In one part of this shop the vehicles were being wired in an early stage of construction which, although a great advantage in many respects, gave an impression of inaccessibility in the case of the development of a fault.

Digitized by Google

Among the many vehicles undergoing finishing touches were cars for Birmingham and other Midland towns. There were also two or three of the latest type of L.G.O.C. 'bus with wide bodies and side rails in lieu of straps. The last department to be visited was the transformer shop, where various points of interest were noted. The largest transformer in hand was a 6,250-K.V.A., 3-phase type. The highest voltage transformer previously made by the Brush Co. had a pressure of 75,000 volts, but one at present under construction will be capable of dealing with 150,000 volts. The largest contracts for transformers in hand for use with rotary converters are 32,000 K.V.A. in 38 units, for the B.T.H. Co., and 21,259 K.V.A. in 24 units, for the G.E. Co. An order for 48 standard transformers, with a total capacity of 24,000 K.V.A., is being executed for the Yorkshire E.P. Co. In addition to winding, testing, &c., the company also makes the cases for its transformers, two old-type "guillotines" being used for corrugating the sheet iron which is built up and welded at the joints by oxy-acetylene apparatus.

Upon the conclusion of the tour of inspection, the visitors sat down to a "high tea," provided by the management, and votes of thanks were accorded to the Brush Co. for a very enjoyable and instructive afternoon. The party left the works for Birmingham at about 6 o'clock.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

Annual Report.

The annual report of the Council of the Institution for the year 1919-20 shows that the membership at April 1st, 1920, amounted to 8,017, a net increase of 994 on last year's figure; it consisted of nine Hon. Members, 1,587 Members, 4,172 Associate Members, 620 Graduates, 1,152 Students, and 447 Associates. One hon. member, Prof. Hendrik Antoon Lorentz, of Leyden University, Holland, was elected during the year.

The military honours and distinctions arising out of the war that have been awarded to members during the year numbered 171.

The death of 55 members during the year is to be deplored, of whom nine laid down their lives on naval or military service. A service in memory of the members of the engineering profession who gave their lives in the war was held at Westminster Abbey on June 18th, 1918. The number of dependents of fallen members whose circumstances would warrant assistance from the War Memorial Fund is negligible, with the result that a larger proportion of the amount subscribed will be available for a suitable memorial in the Institution building. The book of biographies and portraits of members who gave their lives in the war is in active preparation.

Owing to the limited number of vacancies reported, the Electrical Appointments Board has decided that, for the present, members who have served in H.M. Forces shall continue to receive primary consideration.

On December 31st, 1919, the capital account of the Benevolent Fund of the Institution stood at £5,709, and the accumulated income at £1,750. The donations and subscriptions to the fund in 1919 amounted to £537. In the course of the year 24 grants were made, amounting to £291.

On behalf of the Institution the Council has accepted a benefaction from a donor who desires to remain anonymous during his lifetime; it consists of the transfer to trustees for the Institution, as a thank-offering to God for mercies vouchsafed to the donor during the war, of a sum of £2,000 5 per cent. War Loan stock on the following terms: The interest on the stock to be applied in such a way as the Council in its uncontrolled discretion may think fit (*a*) in the first place, to assist the education of one, or more, of those of our countrymen, not being a conscript, who has served overseas during the great war, and who is anxious to enter the profession of electrical engineering, and (*b*) in the second place, and subject thereto, to promote general electrical research.

The Council has rescinded the suspension of the associate membership examination rules, and in future, unless otherwise exempt, candidates will be required to pass the examination. In the case of applicants who have attained the age of 35, the Council may in its discretion dispense with the examination and the thesis.

Arrangements are being made for a deputation of the Council to wait on H.M. Commissioner of Works to urge the necessity for early reinstatement in the Institution building. The return of the Institution to its own premises will compel special reconsideration of financial provision for the future, and some increase in the subscriptions may have to be proposed.

During the year 67 books and pamphlets were presented to the reference library by members and others. The lending library is available to those who wish to borrow books, and during the year 667 books were issued to 300 borrowers, the corresponding figures in the previous year being 497 and 205 respectively. The catalogue is under revision. A number of valuable acquisitions have been made to the museum during the year, notably from the laboratory of the late Sir William Crooks, O.M.

The ordinary meetings held in London have been well attended; 17 ordinary, 18 Council, and 121 committee meetings were held during the year. The papers read during the session numbered 32, and 17 lectures were delivered at territorial and sub-centres, besides which five papers not read at meetings were published in the Institution *Journal*.

During the session the president visited each of the territorial and sub-centres in Great Britain, and also the sub-centres at Liverpool and Sheffield. Sub-centres were formed at Aberdeen, Dundee, Liverpool, Preston, Loughborough, and Sheffield. The meetings held by territorial centres numbered 35, and those held by sub-centres 23.

The Wireless Section of the Institution was formed in the spring of 1918; it has held eight meetings, at which the average attendance was over 140. The Council has drawn up rules for conducting the business of the section, which come into operation at the beginning of next session.

The Informal Meetings Committee has reported satisfactorily; eight meetings were held at which the attendance ranged up to 80, and a successful smoking concert was held in March, 1919. The meetings are now held fortnightly.

Since the armistice the Students' Sections have shown considerably increased activity, and a new Students' Section has been formed in connection with the Liverpool Sub-centre. The total number of Students' meetings was 27, in addition to a number of visits to works.

The scholarships awarded by the Council included three David Hughes, three Salomons, and one Paul scholarships, all tenable for one year, the former being of the value of £50, and the latter of £25. This is the first occasion on which effect has been given to the Council's decision to extend the scope of the David Hughes and Salomons scholarships by opening them to students in the provinces.

A local centre of the Institution has been established for Argentina, with headquarters at Buenos Aires.

The National Electrical Proving House Committee's report has been considered by the Board of Trade, and in the summary of the Government's proposals published in August, 1919, the matter was referred to as follows: "It is proposed to set up at the Board of Trade a Department of Standards, (1) to promote and co-ordinate standardisation generally, and (2) to establish and administer such testing institutions as may be found necessary, and authorise and, so far as may be required, supervise the testing work carried out by technical institutions, trade organisations, or private concerns."

The efforts of the Institution Patents Committee to obtain certain improvements in the patent law were continued in association with other institutions in connection with the passing through Parliament of the new law (Patents and Designs Act, 1919), with the effect that certain modifications were made, but on the whole the result was disappointing.

During the session several deputations representative of electricity supply, and organised by the Institution, were received by the Controller of Coal Mines with regard to coal prices and supplies, and giving to the consumer the benefit of the rebate on coal used for domestic purposes. From the point of view of electricity supply stations the question of coal prices and supplies is still on a very unsatisfactory basis, and the Council is to make further representations to the Government departments interested.

The committee appointed to report on regulations for overhead power lines (excluding tramway working conductors) will shortly present its first report to the Council.

The Civil Engineers' Registration Bill, promoted by the Institution of Civil Engineers, received the attention of the Council and of a special committee during the period under review. It is not the intention of the Institution of Civil Engineers to proceed with the Bill in the present session of Parliament.

The heavy cost of publication has prevented the publication of valuable matters which would otherwise have appeared in the *Journal*. With the object of making the *Journal* of the greatest value to the members a Committee of the Council has under consideration the question of its future form, and whether with a view to economy it should be divided into sections of interest to various groups and circulated accordingly.

The Council has decided to undertake a complete revision of the wiring rules. The committee has been strengthened by an additional representative of the Electrical Contractors' Association and by a representative of the Association of Supervising Electricians.

The regulations for the electrical equipment of ships were published in September, 1919, and were favourably received.

Lloyd's Register of Shipping is to issue a new set of electrical regulations for work done under its survey, and has embodied in them the Institution's regulations. During the year one meeting was held of the Standing Sub-committee, when an important discussion took place on the status of sea-going electricians, with the result that the Council communicated the following resolution to the Board of Trade: "That in view of the growth in the use of electrical power on ships, it would be desirable that the Board of Trade should consider the advisability of holding examinations and granting certificates to duly qualified electricians on sea-going ships." The Council also expressed willingness to prepare an examination scheme, if required.

During the past year a large expansion has taken place in

Digitized by Google

the work of the electrical section of the British Engineering Standards Association. Considerable progress has been made with many matters of great importance to the electrical industry. The closest posible co-operation with the Electrical Research Committee is assured, and some of the B.E.S.A. panels have taken steps in conjunction with that committee to inaugurate the necessary research work, particularly with practice of radiography.

The organisation of the Electrical Research Committee is now nearly complete. The researches already in hand have been brought into full activity, and a comprehensive programme for the future has been prepared. The researches initiated by the Institution are being continued under the control of the Committee, and arrangements are in hand for a rapid extension of programme.

The draft memorandum and articles of association of the proposed Society of Radiographers have been approved by the Board of Trade. The principal objects of the society are to ensure that only adequately trained radiographers are employed in electromedical work, and to promote the science and practice of radiography.

The Council was asked by the Ministry of Munitions in 1916 to nominate a representative of the Institution to serve upon the Nitrogen Products Committee. The Institution's representative was appointed chairman of the Power Sub-committee of the Nitrogen Products Committee, and a letter of appreciation has been received from the Ministry of Munitions acknowledging the services which the Institution rendered in this important work.

In response to a request from the Ministry of Transport, the Council has nominated members to represent the Institution on the advisory panels from which committees of the Ministry are selected.

The annual accounts show that there is a margin to the good on the revenue account for 1919 of £1,495, which amount compares with £1,270 in 1918, an increase of £224. The assets stand at £141,212, against liabilities of £43,222, leaving a surplus of £97,990, an improvement of £6,241 on last year's figures.

The annual report of the Committee of the London Students' Section states that the Council considered all Students' papers read in the years 1915-19 for the revival of the award of premiums, which was made at the end of last session as follows:—A premium of £10 to Mr. R. L. Smith-Rose, B.Sc., and premiums of £5 each to Messrs. A. G. Everett, R. T. Fleming, R. Gates, E. A. Guthrie and A. G. Ramsey. In future the Council has decided to award three premiums of the value of £15 each. In the present session these have been awarded to Messrs. C. E. Webb, B.Sc., E. T. Norris and J. Scott-Taggart, M.C. The British Electrical and Allied Manufacturers' Association has offered prizes of £10 each for papers by Students suitable for publication in the B.E.A.M.A. *Journal*.

FOREIGN CAPITAL IN GERMANY.

As it is asserted to be difficult to raise fresh capital in Germany, the Germans seem to be inclined to welcome the investment of foreign capital in their industrial undertakings, provided that their national character is maintained and adequate safeguards are adopted to ensure the continuance of a majority of the votes in Teutonic hands—as, for instance, by endowing specified blocks of shares with manifold voting powers or the creation of preference shares for this purpose. In the case of the impending issue of shares by the A.E.G., of Berlin, the amount of 25,000,000 marks has been taken over by an American group at a price which would probably not exceed 1,500,000 marks in normal times, and further transactions are said to be in prospect. At the recent extraordinary general meeting of the A.E.G., the names of the American purchasers were not mentioned, but an American copper and banking group (Guggenheim-Kuhn-Loeb group) are stated to be the buyers. In this connection a French contemporary, apparently anxious to ascertain whether the General Electric Co. of the United States was a party to the operation, has received a cable from New York in the negative. Naturally, in view of recent international developments in the electrical industry, the French were highly desirous of being satisfied on this point, the denial in question having been given, it is said, by the General Electric Co. itself.

Herr Karl F. von Siemens, addressing the shareholders at the recent meeting of the Siemens & Halske Co., when it was decided to increase the share capital from 63 to 126 millions of marks and to confer 30-fold voting rights on the 9,500 shares held by the Siemens family, is reported to have stated that it was necessary to interest foreign capitalists in German industry, and the electrical industry, in particular, had still many duties to perform in connection with the scarcity of coal. It was, however, only possible to prevent foreign control by means of preference shares having a dominating voting power. Coming to consider the question of current business, the chairman remarked that definite predictions could not be made; prices and wages changed day by day; at the moment new wages demands had been put forward which exceeded by far those made previously. But an assured peace was desirable, as the exchange was more favourable to the Germans, and would probably steadily improve to the point of intersection of the internal and external purchasing power of their money if they correctly took cognisance of the present period and supported the improving movement by increased production, that is, by higher efficiency. As a consequence, everything should be avoided which would further depreciate the internal purchasing power of money. When they had reached the point of intersection, difficulties in exports would take place, and already the inland prices of electrical engineering products exceeded the world's market prices. The speaker blamed the rise in the prices of iron and steel as being the principal cause which had led to this effect. The requirements for electrical manufactures throughout the world would continue for a long time forward, but the demand had fallen off owing to the high prices resulting from reduced production in general.

Imperial Telegraphs.

So much has already been said in the columns of the public Press, including our own, and so many resolutions have been passed by representative trade and commercial bodies the world over on the subject of providing an up-to-date and efficient Imperial Telegraphic system, that it may seem almost unnecessary to revert to the subject at this date. The policy of our Government in the past has been to appoint Imperial Departmental Committees and Sub-Committees to make a study of the existing conditions and recommendations for their betterment. Their reports are shelved and possibly forgotten as each new Government Chief is promoted to another field of activities, and it is left to men who have the interests of the Empire at heart, the Press and others, to keep interest in the subject alive, and to remind their successors in office of the nation's desires.

For the maintenance of an Empire like ours, it will be agreed that two things are necessary and of paramount importance, viz. :—Steamship and telegraphic facilities. Without these the guarding of our enormous interests and the proper expansion of the productive capacity of our world-wide colonial possessions is rendered practically impossible. The lack of these facilities makes trade and other relations between the Mother Country and her children most difficult, and profitable transactions are diverted to foreign countries and make our peoples across the seas to a large extent economically dependent on them. For strategic reasons alone the call for world-wide and all-red Imperial communications is so strong and well known that the necessity for emphasising their urgency should not exist, but so many important problems have to be faced by our legislators at the present time that the policy of making the Empire telegraphically self-contained may be permitted to remain in abeyance, and for this reason we again call attention to it. The need for prompt action is imperative in view of our late experiences, and for the purpose of maintaining the Imperial spirit which so largely assisted us to victory.

At one time the controlling centre of telegraphs was undoubtedly London, but changes occurred as other countries adopted a national policy, and laid their own cables and erected their own high-power wireless stations, freeing themselves to that extent from dependence on British-owned lines, and steps in that direction are still being taken. It is, therefore, essential that no weakening of our existing network or failure to strengthen and expand it be permitted. Nor should the control of our lines be permitted to pass into foreign hands. Unfortunately, British Atlantic and West Indian cable companies have been allowed to pass under the ownership and management of American companies, and while the United States is a friendly nation, yet with the expansion of her diplomatic and trade interests, political complications may very well arise whereby such ownership may injuriously affect our interests. The lessons of the Spanish-American War, when the telegraphic correspondence of all British West Indian Islands, except Jamaica, was censored and delayed by the American authorities, who controlled the Key West cable route, should not be forgotten. All German cables were cut on the declaration of the European war, and had it not been for her high-power wireless stations, Germany would have been completely isolated. The United States has established a large number of these stations, and is rapidly building more, and eventually communication by wireless will be available to all European countries, South America, &c. Other countries are also going ahead in this direction. High-power wireless stations are as essential to a country as ships and aeroplanes, and our legislators should lose no time in supplying the necessities of our Empire in the way of cables and wireless stations. It will not need much investigation or study to decide what shall be done, but we hold the opinion very firmly that much has been left undone in the past, and that leeway has to be made up, and that rapidly.

The Beama Dinner.

THE leading feature of the proceedings at the dinner of the B.E.A.M.A., last week, was the optimism of Sir John Snell, who made on that occasion, we believe, his first public speech since his appointment as Chief Commissioner. As a result of—or, as a later speaker implied, in spite of—the attentions of no fewer than seven Departmental Committees since 1916, Sir John said, the Electricity Supply Act had been passed—"the great charter of electricity"—and the electrical industries were on the brink of an era of unimagined prosperity. We earnestly hope that his view is correct; every indication certainly points in that direction, and, as has happened before, whether other industries thrive or languish, the electrical industry is inherently certain to develop. The Utopia is placed by Sir John at five to ten years hence; in the meantime, the Commissioners are struggling with the accumulated arrears of five years, and appeal for the patience and forbearance of the industry. We are sure that they have the sincere sympathy of all electrical men, and will do their utmost to get the machine into full operation. Apart from the routine duties of various other departments and bodies which have fallen upon their shoulders, we venture to urge them to settle the broad principles as quickly as possible; in particular, we would again draw their attention to the case of the small isolated stations, and the urgent need for these "to know where they stand," so that they can at once get on with the extensions that are urgently called for. The revision of the various codes of regulations is also a matter of most pressing importance, particularly in respect of the prehistoric and obsolete regulations for overhead mains, on which a committee has been sitting for some 18 months, so that the ground must have been pretty well covered by now. Sharing out the country into districts is a matter of less urgency than the settlement of these questions, and if completely satisfactory solutions to them cannot be given at the moment, let us have the best approximation to them that can be given *now*.

The Station Men.

AT the dinner above-mentioned, Mr. James Swinburne, who, unfortunately, is too seldom seen and heard at electrical gatherings nowadays, pleaded the cause of the salaried men with an earnestness and sympathy which commanded attention. In view of the commotion set up recently by an advertisement in our pages, which placed a technical officer on a pecuniary par with a fitter, and Mr. Swinburne's remarks, the arrival of a batch of papers from the Electrical Power Engineers' Association this week, embodying particulars regarding the National Joint Board which is dealing with the case of the station men, and the schedules of wages agreed upon, is very timely. The Board will play the part of a Whitley Council for the station technical and clerical staffs, which are otherwise unprovided for in this respect, having been omitted from that scheme by an extraordinary oversight. As we pointed out recently, it is incumbent upon all electricity supply authorities to accept the decisions of the National and District Joint Boards under this scheme; they cannot expect their staffs to do so if they themselves do not. Whilst writing, we have received particulars of a dispute between Wimbledon Corporation and the National Joint Board, in which the Corporation turned down the recommendation of its own Electricity Committee that an award by the Board of an increase of salary of £30 per annum, from January 1st, 1920, should be adopted.

As we have already pointed out, the workers are not going to play at "heads I win, tails you lose," to please the employers. Loyal compliance with the decisions of the Joint Boards is essential to industrial harmony. The electrical staff of the Corporation threaten to cease work on Monday next: the Executive Council of the E.P.E.A. will support them, unless the decision of the Corporation is reversed, and who will blame them? Certainly we shall not. We hope, however, that wiser councils will prevail, and that peaceful methods will be found to settle the dispute, in which the Corporation of Wimbledon is in an utterly untenable position.

A STUDY IN LOAD FACTORS.

Based on an Experiment carried out by the Glasgow Corporation.

By COUNCILLOR DENNY, Member of Glasgow Town Council.

In August-September, 1918, Glasgow Corporation Electricity Department fitted up two tenement dwelling-houses with electrical apparatus for all domestic purposes. Ammeters were put in circuit in each case for record-keeping purposes. The rate of charge was on the basis of 4½d. per B.O.T. unit for 70 units, and ¾d. per unit for all further units consumed. In the one case the consumption for a year amounted to 10,052 units, and the amount of the electricity bill for the year was £32. In the second case, the consumption for the same period was 10,981 units, and the bill £35.

In the two houses in question no coal or gas was used for any purpose during the period of the experiment. It is estimated that had coal and gas been used for the purposes covered by the electrical energy consumed, the cost would have been £16. The houses in question comprised two rooms, kitchen and bathroom in each case. In one house the equipment consisted of :—One 3-kw. oven with hot-plate on top; one 2-pint kettle; one 1-kw. immersion heater; one smoothing iron, 2-ampere; two 3-kw. radiators; one 1-kw. radiator; one 1·5-kw. Belling fire. In the other house the apparatus consisted of :—Cooker; two hot-plates; one oven with top grill; one 2-pint kettle; three radiators; one smoothing iron.

Having established the fact by experiment that the use of electricity is entirely practicable for all domestic purposes, and knowing that electricity so used has many advantages from the point of view of health and convenience, it is obviously a matter of urgent public concern to devise ways and means whereby electricity can be made available for all domestic purposes.

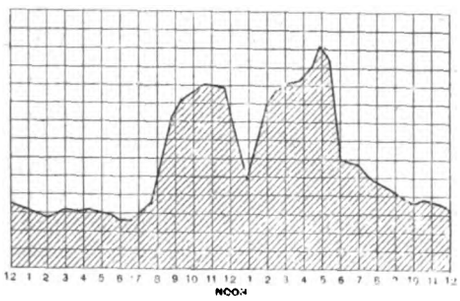

Fig. 1.

The first consideration is cost. The difference between gas and coal and electricity must be substantially reduced. There are various suggestions forthcoming as to how this may be managed. In the first place, electricity supply concerns, whether municipally or company owned, need to be brought to see the possibilities of the domestic load in the improvement of load factor. We hope to show that it will pay the electrical undertakings to take a liberal view of the domestic consumer, and to cater for him in such a way as to lead him to use electricity for all purposes in the home.

Electricity supply from the load factor point of view may be said to have had three phases. At first it was thought that electricity would always be mainly used for lighting, and all the early legislation relative to electricity supply referred to lighting. The early Acts were all Electric Lighting Acts. At that time the lighting load represented the major portion of the total output, and the power load was a matter of minor concern. The development of the electric motor has changed all this, and electricity supply is now in the second phase. The power load is at present the dominating factor in electricity supply, and lighting is comparatively negligible. But a third phase is now appearing: the domestic load is gradually being recognised as a serious competitor to the power load, and it has attractions to the supply undertaking which even the power load does not possess. The great advance in the manufacture of domestic appliances during the last few years has turned the scale in favour of the domestic load being better distributed and bigger than the power load. The experiment recently carried out by the electricity department of the Glasgow Corporation, already mentioned, has given conclusive confirmation of this important fact. In one house, the load extended over the full 24 hours, while in the other it extended over 15 hours of the 24, whereas the power load normally is confined to 10 hours per day. It does not seem to be clearly understood that the domestic load has greater possibilities than the power load. Glasgow, for example, it is estimated, has in the aggregate a power load equivalent to 1,000,000 h.p.; and allowing for what is known as the diversity factor, the electricity department of the Corporation could supply that load with 400,000 kw. of generating plant. On the other hand, after making allowances, there are 228,000 occupied houses in Glasgow. Taking these at 3¼ kw. per house, we should require 721,000 kw. of generating plant to meet their demand. Further, the output for power purposes, basing the estimate on 55½ hours' use of the maximum demand per week, would be 1,150 million units per annum, whereas the output for domestic supply, based on the above-mentioned experiments, would be 2,683 million units. Thus the securing of the domestic load on the mains is at least of equal importance, as a commercial consideration, to that of the power load, so far as the public supply of energy is concerned. If one extends the point of view from the cash nexus and the profit and loss account of electricity supply, to the question of public health, the whole problem takes on a fresh complexion, and arguments in favour of encouraging the use of electricity in the home are overwhelming. The advocacy of the importance of the domestic load in this connection is not to be construed as an attempt to minimise, or to throw cold water on, the power load. The industrial importance of an ample, cheap, and reliable supply of electrical energy is of the first national consequence. The present article is rather intended to show that the encouragement of the domestic load along with the development of the power load will beneficially affect both, and will tend to cheapen electrical energy to the whole body of consumers.

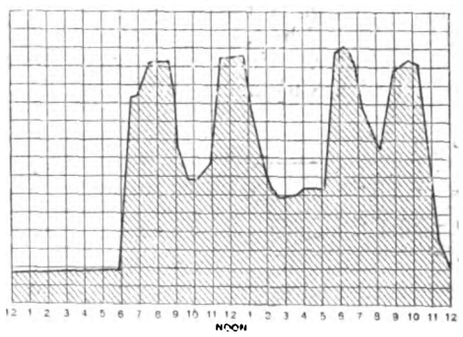

Fig. 2.

The curve on fig. 1 shows an average week-day load on the Glasgow mains, and gives a load factor of 40 per cent. for the 24 hours. For the whole year the load factor was 27 per cent. The output was 170 million units and the maximum demand 70,000 kw., approximately one-sixth of the demand to be expected from the total power load of the city.

Fig. 2 has been made by adding together the load curves of the two experimental houses and multiplying the addition by 8,000. The result is a maximum demand of 75,000 kw. and an annual output of 185 million units, the actual consumption being 169 millions. It will be seen, by reference to fig. 3, that the domestic load of 16,000 houses—about one-twelfth of the number in the city—

Digitized by Google

would more than double the present output, with an addition of only 57 per cent. in plant capacity.

Fig. 3 is a combination of figs. 1 and 2. It shows an annual load factor of 55 per cent. as compared with the present load factor of 27 per cent., or 63 per cent. as compared with 40 per cent. week day load factor referred to in fig. 1.

Fig. 4 shows the domestic curve multiplied by two, and superimposed on fig. 1, by means of which we obtain a curve

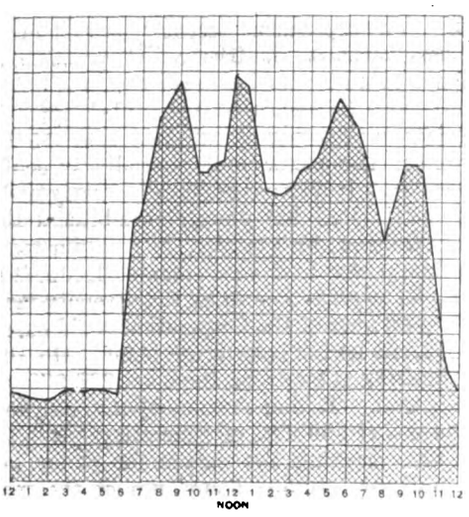

Fig. 3.

showing one-sixth of the possible obtainable load for power and domestic supplies. It will thus be observed that the main load runs up to 120,000 kw., and extends over 18 hours out of the 24, while the peaks average 1¾ hours' duration and, multiplied by 4, give a total of 7 hours' use of the peak load per day. The comparative figures for the existing main load are 9½ hours out of the 24, or just

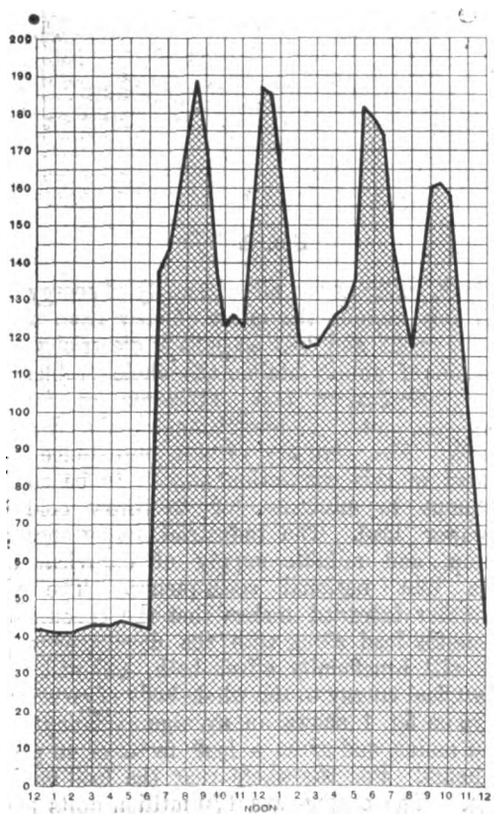

Fig. 4.

2½ hours more than the new peak load, while the extent of the peak at present has an average of one hour's duration as against the new figure of seven mentioned above.

When it is considered that no allowance has been made for tramways, electrochemical processes, for the electrification of general vehicular traffic, &c., it will be seen that the load could be made nearly uniform throughout the entire day, and thus reduce the standing charges to nil. Moreover, the economy in coal consumption through larger plant units, together with reduced capital and labour charges, will further contribute to the possibility of reducing the price of electrical energy to all classes of consumers. The foregoing figures are also based on coal remaining at its present high price. Although the Glasgow experiments show annual bills of £32 and £35 per house, by the simple development of the industry on economic lines, it is not too much to expect that we should, at least, obtain electrical energy for domestic purposes at ½d., instead of ¾d., which would mean that the annual bill for electrical energy for all purposes in a working-class home would be £22 to £25, as against £16 for coal and gas.

The question, therefore, is: Are the people prepared to purchase immunity from the dirt, dust, domestic drudgery, and atmospheric pollution, consequent upon the use of coal and gas, at the small extra cost of, say, 2s. 6d. per week for electricity? The present writer ventures to think that with the foregoing facts before them, the people of this country will unhesitatingly cast their vote in favour of the universal adoption of electricity for all purposes.

Meanwhile, the nation ought to be prepared to take the opportunity of the large housing schemes at present under consideration to revolutionise currently accepted ideas with regard to lighting, heating, and cooking installations in domestic premises. In a word, the ideal in housing ought to be the chimneyless house which would solve along economic and sound commercial lines the whole problem of atmospheric pollution.

SWITCHBOARD EXTENSION.

By F. A. P.

In the early days of electrical plant, the switchboard was merely a board upon which were mounted various instruments and switches symmetrically arranged, the back being usually a maze of loose wiring, making extension difficult. In the course of time, it was divided up into separate panels, and each machine, &c., had all its gear mounted on one panel, so that extra panels

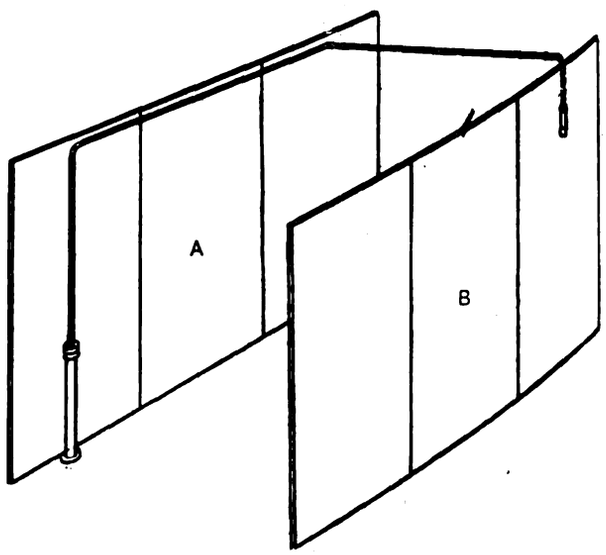

Fig. 1.

could be more conveniently added. Other arrangements more suitable for rough usage, now in vogue, consist of armoured units which can be placed side by side to form a complete switchboard.

Now these later arrangements are a great improvement on the earlier boards, but the writer has yet to see a really flexible arrangement carried out in practice. The average board has panels crowded on the back with apparatus and cables, and with busbars crossing horizontally, making it practically impossible to extend, and

Digitized by Google

at the same time keep to the orderly arrangement of panels originally installed. When an alteration or extension is required the board as a whole is unnecessarily complicated, say, by adding generator panels at the end of the existing board beyond the feeder panels, or *vice-versa*.

Now, if all machines, feeders, &c., had their cables run to the nearest point on the wall behind the switchboard, or preferably on a separate frame mounted just clear of the wall, and were then cross-connected to their

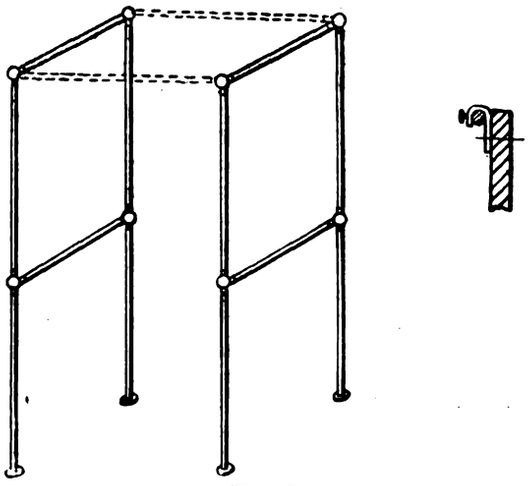

Fig. 2.

particular control panel, a far more flexible arrangement would be obtained. The wall or back frame would be the permanent board, but the front frame would carry panels which could be rearranged.

Referring to fig. 1, A is the back frame where all feeder or machine cables terminate, B is the switchboard proper which can be added to or any section moved if the cross connecting cables are lengthened or shortened to suit. If these consisted of standard lengths and sections of copper rod with clamping connectors, this could easily be done.

On the type of board suggested busbars would not cross the panels, but would have a panel to themselves, and need be only of sufficient length to take all the required connections. This need not necessarily entail extra expense in copper if the connecting cables take the shortest possible route.

Another point is that the switchboard cannot usually be safely worked on when alive, chiefly owing to overcrowding. But it should be possible to do so, in order to avoid shutting down for this purpose, and the avoidance of crossing busbars would distinctly assist in this direction, combined with the use of box spanners well taped or insulated. These can be purchased very cheaply nowadays.

The writer suggests that all boards should be made as simple at the back as on the front, and that rheostats, &c., should not be mounted directly on the back unless one can easily get at the cable lugs. Where they are difficult of access a separate slate terminal block might very well be used.

Frames should be of a uniform size, say, 7 ft. 6 in. by 2 ft. 6 in., if the size of the largest apparatus will allow, and should have adjustable horizontal members. One wonders why the American system of tubular frames is not more often adopted, being simple to build up, extend, or dismantle.

Some lengths of piping and a stock of fittings take up little space, and would be much appreciated by the engineer called upon to put up a temporary board for testing or other purpose, or a back and front frame might be made up, and kept in stock, ready to be joined up by two or more pieces of piping to make a box frame which would stand anywhere. Apparatus or slates could be hung on the tubing by simple hooks or clamps for temporary use, as in fig. 2. This frame would be used up in the main switchboard when it was required to extend it.

When we really do get our cheap electricity, extensions and alterations will be of more importance than they are, perhaps, at the present time, but the time will come, and users of power will be well advised to keep in mind this possibility when installing plant, and put in switchboards capable of some such flexibility as outlined above.

HEAT TRANSMISSION AND BOILER EFFICIENCY.

By EDWARD INGHAM, A.M.I.Mech.E.

Although the question of heat transmission through metal plates is one of great importance to all engineers, and particularly to designers of steam boilers, economisers, and feed water heaters, &c., very few subjects are so imperfectly understood. It is perhaps no exaggeration to say that comparatively few engineers are acquainted with the laws of heat transmission, and in the light of the numerous experiments and researches which have been made during recent years, this is a matter of surprise. A thorough knowledge of the subject is absolutely essential if improvement in existing designs of steam boilers and similar vessels is to be effected.

In the early days of steam boilers, it was commonly believed that the efficiency of the heat transmission through a metal plate depended almost entirely on the nature of the metal, and on the thickness of the plates. Hence it was thought that, since copper was a better conductor of heat than steel, this metal, although inferior in tensile strength, was a more suitable material for the construction of a boiler. As time went on, and more experience of the working of steam boilers had been obtained, it was found that soot and dirt, scale and grease, offered a far greater resistance to the passage of heat from the furnace gases to the water in the boiler than did the plates themselves.

The prevailing idea at the present time appears to be that the principal factor in preventing the free flow of heat from the hot gases to the water is scale, and figures are frequently given to show how seriously the efficiency of the boiler falls off if scale be allowed to accumulate on the plates. Thus, it is stated by one authority that the percentage loss of fuel due to layers of scale 1/64 in., 1/16 in., $\frac{1}{8}$ in., and $\frac{1}{4}$ in. thick are respectively 2 per cent., 9 per cent., 18 per cent., and 38 per cent. Too much reliance should not be placed on such figures, since so much depends upon the particular nature of the scale. They will, however, serve to show that scale is an important factor in reducing the efficiency of a boiler. In the same way, soot, being a very bad conductor of heat, has also a serious effect. The importance, therefore, of maintaining the plates clean on both the water side and the fire side cannot be too strongly urged.

Supposing, however, the plates to be perfectly clean, the amount of heat which is actually transmitted through them under working conditions is surprisingly small. For example, the amount of heat which may be transmitted through 1 sq. ft. of clean plate per hour is given by the formula:—

$$q = \frac{k\,(t_2 - t_1)}{T},$$

where q = the quantity of heat transmitted in British thermal units per hour.

t_2 = the temperature of the hot side of the plate.

t_1 = the temperature of the cooler side.

T = the thickness of the plate in inches.

k = a constant, which for mild steel is 450.

Digitized by Google

If we apply this formula to the furnace plates of, say, a Lancashire boiler, where the temperature of the hot gases is 1,400 deg. F., and the temperature of the water 350, we find that the heat transmitted per sq. ft. per hour through, say, ½-in. plates, should be:—

$$q = \frac{450\ (1{,}400 - 350)}{\frac{1}{2}} = 945{,}000 \text{ B.TH.U.}$$

Now in actual practice, the amount of heat actually transmitted will be only about 5,000 British thermal units per sq. ft. of heating surface per hour. It will be seen, then, that the heat actually transmitted through a boiler plate is only a very small fraction of the heat which would be transmitted through a clean plate of the same material and thickness, with the same temperature range. Evidently, in the case of a boiler, there must be present on the plates certain agents which are seriously impeding the free flow of heat from the hot gases to the water. It would appear that these agents comprise a stationary film of gas on the fire side, and a similar film of water on the water side.

The experiments already referred to have served to show that if these stationary films, particularly the gas film, be removed, the heat transmission is enormously increased, and such removal may be effected by compelling the gases to move over the plates at high velocity. The generally accepted opinion amongst engineers has hitherto been that if a maximum of heat is to be extracted from the furnace gases, the latter shall not be allowed to move too rapidly over the plates, and hence

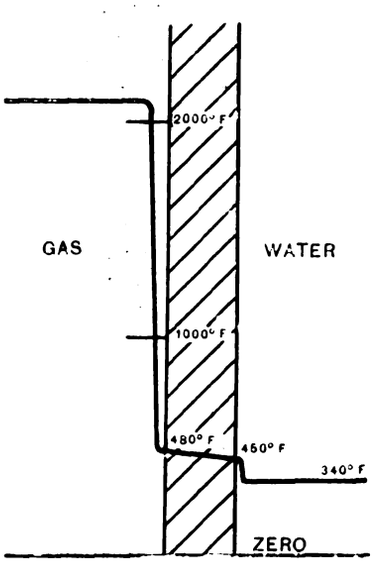

Fig. 1.

designers have been inclined to arrange that the gases shall remain in contact with the hot surfaces long enough for them to give up as much as possible of their heat to the water. For example, it is sometimes argued that the brick-work flues of Lancashire boilers should be made of large sectional area in order that the speed of flow of the gases will be slow. There can, however, be no longer any question that if a high rate of heat transmission is to be obtained, the gases must flow rapidly over the hot plates.

More than forty years ago, Prof. Osborne Reynolds showed that the rate of heat transmission increases as the speed of flow of the gases increases, and a year or two later, some experiments made in France proved that by closing up one-half of the tubes in a locomotive boiler, the heat transmission was again increased.

The late Prof. Nicolson, of Manchester, after carrying out exhaustive experiments, concluded that the rate of heat transmission depended principally upon the product of the speed and the density of the gases, but that the average value of the gas and metal wall temperatures, the nature of the metal surface in contact with the gas, and the hydraulic mean depth of the tubes through which the gases passed, were also factors which influenced the rate of heat transmission. As the result of his experiments, he designed a boiler of a modified Cornish form, in which the gases were forced through the tubes at high velocity by means of a powerful fan. The boiler was, in fact, a forced draught steam plant, where the draught was an unusually high one. The rate of evaporation in this boiler was extremely high, higher, in fact, than had previously been obtained in any other boiler, but the efficiency was seriously reduced because a large amount of steam was consumed in driving the fan.

From what has been said, it will be evident that the problem to be solved by boiler designers who desire to obtain a high efficiency is that of procuring a high speed of gas flow with the expenditure of only a small amount of power for whatever device is employed for forcing the gases over the heating surfaces.

Many years ago, Prof. Perry, in his well-known book on the "Steam Engine," stated that "the surfaces of the metal wall must be scrubbed, the one with hot gases and the other with circulating water," and further, "the best boiler will be one in which a flame or a hot gas tube surrounds or is surrounded by a water tube, the gas and water flowing fast in opposite directions."

It will be seen that there is much scope for research and experiment on the part of boiler designers.

It may be mentioned that the principle of high speed flow has been employed to great advantage in the design of certain feed water heaters. A well-known firm of engineers, who specialise on such apparatus, have designed what they term a "high velocity heater," the result of experiments in which water was passed over the steam heated surfaces at a considerable velocity. It was found that the quantity of heat transmitted was very much greater when the flow was rapid than when sluggish. It is claimed for this high velocity heater that the feed water may be heated some 20 deg. F. higher than is possible with heaters of the ordinary type.

Those who wish for further information on this important question of heat transmission will find the subject fully treated in a paper by Prof. Nicolson, entitled "Boiler Economics and the Use of High Gas Speeds," published in the *Transactions* of the Institution of Engineers and Shipbuilders in Scotland, 1911. Although we are unable to discuss this paper here in detail, we have thought it advisable to reproduce a diagram (see fig. 1), which Prof. Nicolson has given to show the enormous effect of a stationary film of gas on a boiler plate in impeding the passage of heat from the furnace gases to the water in the boiler. It will be noted that the original temperature of the gases is taken to be a little over 2,000 deg. F., but the temperature at the point of entering the plate has fallen to 480 deg., and at the other side of the plate, to 450 deg. A further drop then occurs, due to the presence of scale, the final temperature of the water being 340 deg. F., which corresponds to a steam pressure of approximately 100 lb. per sq. in. gauge. According to Prof. Dalby, the fall in temperature due to the resistance of the gas film, is about 97 per cent.; that due to resistance of the plate, 1 per cent.; and the fall due to the resistance of the water film, 2 per cent. Evidently, so far as heat transmission is concerned, the resistance offered by the boiler plates is so slight that it is of practically no importance.

Another Oil-Electric Yacht.—The Westinghouse Electric and Manufacturing Co. has been awarded the contract for supplying the electrical propulsion equipment for the yacht *Guinivere*, which is being built by George Lawley & Son Corp., Neponset, Mass., for a member of the New York Yacht Club. The *Guinivere* is to be a three-masted schooner, with oil-electric auxiliary power, and will be 195 ft. overall, 150 ft. water-line, and 32½ in. beam. Her draught is 15 ft., and her displacement 642 tons. Her power plant is to consist of two six-cylinder, 350-H.P. Winton-Diesel oil engines of 225 R.P.M., each of which is directly connected to a 225-KW., 125-volt, D.C. generator. Each engine drives also, through a chain, a 15-KW. exciter, which supplies the field current for its generator and the propeller motor, and, in addition, power for other purposes. The propeller is connected through a clutch to a 550-H.P., 250-volt motor of 220 R.P.M. Normally, the two generators connected in series will supply current to the propeller motor, but the control is so arranged that either can be used alone to operate the propeller at reduced speeds or in case of emergency.—*Electrical News*, Canada.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

A Liquid Motor Starter.

Among the more recent developments of the General Electric Co., Ltd., 67, Queen Victoria Street, E.C. 4, is the liquid starter shown in fig. 1. This consists of a sheet steel tank, three earthenware chambers, top and bottom electrodes, operating gear, and accessories. The earthenware chambers, in which the electrolyte is placed, are enclosed in the tank, thus preventing leakage should the earthenware be cracked. The cast-iron electrodes fitted to the lower ends of the chambers are connected through porcelain insulators to the cables from the rotor terminals. The insulating bushes on the lower side of the bottom contacts are protected by a shield against any leakage which might cause short circuits. The electrodes are supported on mild steel

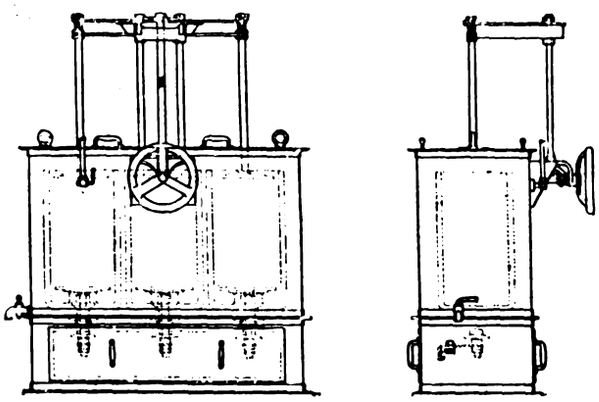

Fig. 1.—G.E.C. Liquid Starter.

rods, and connected together at the top with laminated copper strips. These dipping contacts make an efficient contact with the bottom electrode, and there is no residual resistance. To obviate flashing the starter is so designed that the electrodes are always immersed. The operating mechanism is provided with springs which are compressed as the handwheel is screwed down. At its lowest position the handwheel comes against a stop which prevents overwinding and ensures that neither the pots nor insulating bushes are overstrained. It is claimed for this starter that it is capable of starting a motor against twice full-load torque in 1½ minutes three times every half-hour.

A Watertight Tumbler Switch.

The Delta Electrical Co., of Temple Courts, Temple Row, Birmingham, has recently placed on the market a 5-amp. tumbler switch which possesses the following features: It is operated by an external dolly, as shown in fig. 2, and it is

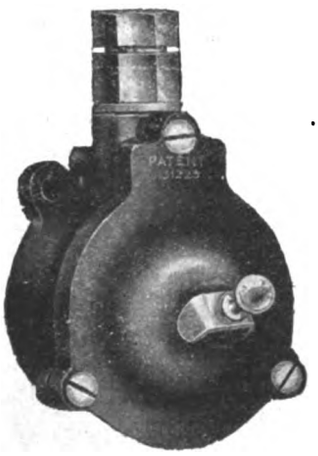

Fig. 2.—Watertight Tumbler Switch.

wired without the removal of the interior. All external metal parts are in electrical continuity, so that it is impossible to sustain a shock when the switch box is earthed. It is rendered watertight by a packing washer between the lid and box. This washer is made of specially treated asbestos, and is claimed to be acid, steam, and moisture proof.

Baking Carbon Electrodes for Electric Furnaces.

La Technique Moderne states that French patent No. 488,778/1918 has been granted to Det Norske Aktieselskab for Elektrokemisk Industri Norsk Industri-Hypotekbank in respect of improvements designed to overcome the low initial conductivity which prevents the baking, by electricity, of mixtures of carbonaceous matter and binders forming electrodes for electrolysis or electric furnaces. The difficulty is that the initial conductivity of the formed electrode is so low that it is only possible to send through it a current of about 1 amp., whereas some hundreds or even thousands of amperes would be required to bake the material. The invention provides for the mixture of coke, graphite, tar, and pitch being formed in a mould round one or more iron or other metal rods extending the length of the mould. The current used for baking passes at first through the metal bars and gradually extends to the whole of the electrode as the conductivity of the latter improves. The specification states that 20 electrodes in series may be connected to the secondary of a variable voltage, 220 amp., 110 volt transformer. Commencing at 800 amps., the current is increased to 2,500 or 3,000 amps. during the final stages of baking. The baking occupies 25 to 35 hours, and the electrodes are allowed to cool in the furnace for 36 hours. The size of electrode is not stated.

Electrodes of this type for lofty metallurgical furnaces may be baked *in situ* if arrangements be made for continuous mixing and baking. Waste heat from the furnace then contributes to the baking. Fresh sections of electrode are

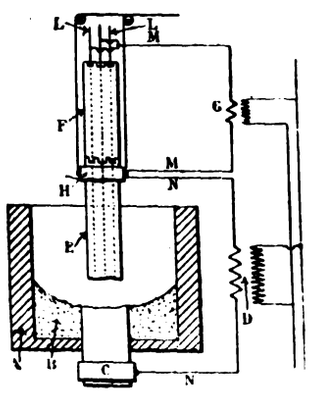

Fig. 3.—Arrangement for Baking Carbon Electrodes.

moulded and baked to keep pace with the consumption in the furnace. By employing the arrangement shown diagrammatically in fig. 3 the current required for baking and the cross section of the metallic reinforcement in the electrode may be reduced to a minimum. The furnace A, charge B, lower electrode C, and main transformer D are arranged as usual. The equipment for continuous moulding of the upper electrode is omitted for simplicity. The lower part of E is baked completely, and carries 18,000 amperes. The upper portion F is newly moulded, and is heated by 2,000 amps. derived from the auxiliary transformer G. The reinforcing bars L, and the connections M have only to carry 2,000 amps.

Templet for Cutting Commutator Mica Segments.

Commutator micas are usually cut by first laying one of the segments on a sheet of mica and marking out the desired form, after which the segment is cut out with a pair of shears. This method, even at the very best, does not produce segments that are of uniform shape. If a rigid construction of the commutator is to be obtained, not only must

Fig. 4.—Templet for Mica Segments.

the insulating segments be of the proper thickness, but the V's in them must be uniform in shape and size, as also the part of the segment on the inside of the commutator.

To obtain uniformity a templet, similar to that shown in the figure, may be used as a guide in cutting the segments. It is made of a piece of 1/16 in. iron bent in the shape

Digitized by Google

indicated. After this has been done the two sides of the templet are gripped in a vice and the V's cut the exact shape of those in the commutator for which the insulator is being cut. A notch is cut at A to indicate the maximum width of the mica, and another at B to give the minimum width. The mica is cut to the approximate width of the segments, and then the templet is filled tight with these strips. While being held in a vice, the insulating segments are cut to the required shape with a hacksaw. A notch is cut in the mica at A and B to give the maximum and minimum width, so that after the segments are removed from the templet the excess material can be cut off with a pair of shears. The outside dimensions of the segments need only be approximate, since the excess material can be removed when the commutator is turned down.—*Power.*

THE COMMERCIAL APPLICATION OF ELECTRICAL OSMOSIS.

IN a paper bearing the above title, read before the ROYAL SOCIETY OF ARTS on May 19th, Messrs. J. S. Highfield, M.Inst.C.E., M.I.E.E., W. R. Ormandy, D.Sc., and D. Worthall-Laurie, F.I.C., put forward the results of practical work in this direction. The first part of the paper dealt with the definition of terms and the history of the study of matter in a colloidal state. After a brief general survey of the subject the paper was devoted to the application of the principles involved to the purification or practically the reconstruction of clay. The late Count Schwerin demonstrated that the addition of small quantities of an alkali to a suspension of clay in water resulted in the particles becoming highly mobile, and in the impurities such as pyrites, mica, &c., falling to the bottom of the vessel. The addition of an acid caused coagulation of the particles. Mr. Highfield proved to the audience by experiment that this was so. It was found that bodies in suspension in an electrolytic solution which tended to move to the cathode required an acid electrolyte to bring about the necessary dispersion or peptisation, whereas bodies with a tendency toward the anode required a solution of an alkaline character. By means of a simple device, a copper anode in an alkaline solution in which clay was suspended, the principle was demonstrated, and the audience was shown how in a remarkably short space of time the anode became covered with a thick layer of purified clay. Photomicrographs taken by means of polarised light showing the osmosed material and the deposits of felspar, quartz, mica, &c., were exhibited.

The commercial development of the principle of osmosis was described. The machine used consists of a tank, containing in its lower part two paddles which keep the suspension in continual movement, and drive it in a steady stream between the cathode and anode. The latter is a metal cylinder revolving at a speed of about one revolution in three minutes. The cathode surrounds the lower half of this cylinder, and there is a space of three-quarters of an inch between the two. A scraper is fixed against the direction of rotation of the anode and takes off the deposit to a chute over which the clay moves in a continuous "blanket." Fresh clay suspension is introduced into the lower part of the trough in a continuous stream, and the effluent water is returned to be mixed with more clay. The action of the machine is as follows: The clay in suspension, passing through the perforated cathode, becomes negatively charged, and immediately moves to the anode, while the water is attracted to the cathode forming a watery zone. Fresh clay entering the machine passes through this zone, and all the impurities are washed away with the effluent from the machine. As the effluent invariably contains some clay in addition it is taken to a settling tank, where the mica and other impurities settle out, and the rest of the effluent is then put into a mixing machine from which the osmosis machine is fed. The clay leaves the machine in the form of a sheet varying from one-quarter to one-half of an inch in thickness containing a little water which, owing to the loose form of the material, is easily expelled. By means of such a machine with a cylinder five feet long and two feet in diameter a total of 1,000 tons of purified clay may be produced per annum. The working cost varies widely with the class of clay treated, the amount of energy required ranging from 20 to 70 B.O.T. units per ton of material produced. A small-scale working model was put into motion, and operated very effectively. Another application of electro-osmosis was then described. This is a filter press which has been developed for the de-watering and purifying of many substances in a finely divided state. In its simplest form the press consists of a series of chambers into which the suspension is fed at a sufficient head to ensure a rapid filling. The chambers are closed in on both sides by filter cloths, but the latter are held in position by grooved or perforated metal or carbon plates, one forming an anode and one a cathode. An electrical pressure of from 20 to 100 volts, depending on the substance being operated upon, is established between the plates, and the water is forced towards the cathode. Materials fine enough to choke the ordinary filter press can by this means be de-watered, and the press can, therefore, be used for filtering clays and other colloidal materials which the ordinary press cannot deal with.

In the discussion which ensued upon the conclusion of the reading of the paper, Sir HERBERT JACKSON paid a glowing tribute to the results obtained by electro-osmosis in the production of purified clay. Owing to the high temperatures to which vessels made of this clay could be subjected, combined with a low sintering temperature, the manufacture of high-grade optical glass had been facilitated to a great extent.

Mr. WALTER HANCOCK also spoke of the great advantages to be obtained from clay produced by this process in the production of optical glass, and said that after using the "ore" for so many centuries they had at last got down to the "metal."

Mr. MURRAY MORRISON predicted a large field of application of electro-osmosis in the near future.

Mr. PATCHELL referred to the fact that prior to 1910 the process was in use in Germany, but had been "turned down" by this country chiefly on the part of Cornish manufacturers, whose methods were hard to change, especially as sales were already abreast of supplies.

Mr. GOODWIN asked if the principles could not be applied to peat production and the decomposition of sewage.

Dr. ORMANDY, in his reply, said that crucibles made of clay produced by electro-osmosis had been found to withstand a temperature of 1,500 deg. C. for fifteen journeys, whereas the ordinary crucibles, besides introducing iron and other colouring matter, would not withstand three charges. Peat could easily be dealt with by the process, but the treatment of sewage was a much more difficult and complicated matter. There were at present several works in Austria producing clay in very large quantities by electro-osmosis, and even Spain had become alive to its possibilities.

THE SYNTHETIC MANUFACTURE OF NITRATES.*

IN the fixation of atmospheric nitrogen by the electric arc, the reaction depends mainly upon contact of the air with the arc, and the best device is clearly that which brings most air under the action of the arc. In single-phase furnaces a considerable percentage of air escapes this action; thus in the Birkeland-Eyde furnace, the arc alternately fills the higher and lower halves, but never both simultaneously. Then as the air penetrates into the chamber of reaction through all the orifices it results that only half this air is on the side where the arc has been emitted at the same instant, whence there is a loss of air, especially for the orifices near the circumference. Analogous inconveniences have occurred with the Schönherr and Pauling furnaces.

In three-phase furnaces the three electrodes, separated by refractory bricks, are placed so as to entirely surround a pyramidal space with six sides, which air, entering at the base, gradually fills before passing out through the single opening at the top. The three-phase currents which feed the electrodes produce an arc rotating with the frequency of the source, viz., at the rate of 50 revolutions per second, and as the air requires more than 1/50 second to pass through the reaction chamber, each particle is brought into contact with the flame.

For good working of the furnaces it is essential to blow the arc. This can be done either with a permanent magnetic field (Birkeland-Eyde) or a variable magnetic field (Moscicki), or by the aid of the air passing through the furnace (Schönherr, Pauling, Kilburn-Scott). The inconvenience of magnetic blowing is that it necessitates direct current to feed the electromagnets. The substance of the electrodes exerts considerable influence on the production. The Birkeland-Eyde electrodes, for example, are copper alloy, which experience has demonstrated to be very advantageous. In some Pauling furnaces, at Legnano, Dr. Rossi utilises electrodes made of an aluminium alloy, which, it appears, exerts a catalytic action favourable to the reaction. Single-phase furnaces are set working by bringing the electrodes together until the voltage applied is sufficient to produce the arc. With the high voltages usually employed, there is danger of intense rushes of current and excessive voltage. In three-phase furnaces there is no regulation, the arcs are excited with auxiliary sparks; this enables the electrodes to be kept at the optimum distance.

In all electric furnaces it is of very great importance to make working continuous, because extinguishing and igniting the arcs may cause excessive voltages and other harmful phenomena. The three-phase furnace has a marked advantage in this respect, because the phases are always traversed by currents, and the arcs are mutually maintained. The power is always practically at a maximum, whereas in a single-phase furnace it passes from zero to the maximum value, twice per period.

Preliminary heating of the air gives economy in heat, raises the temperature of the furnace, and also dries the air. This, according to Prof. Guye, gives a slight increase in production. It facilitates ionisation also, and consequently the working of the arc. A temperature of 250 deg. C. gives good results. It

* From *L'Engrais*, January 9th, 1920.

Digitized by Google

is profitable to obtain this heating with gas from the reaction chambers.

A high-efficiency heater can feed several furnaces.

The chemical reaction being reversible, it is important to cool the nitric oxide produced rapidly. In single-phase furnaces this cooling is obtained with excess of air blown into the reaction chamber.

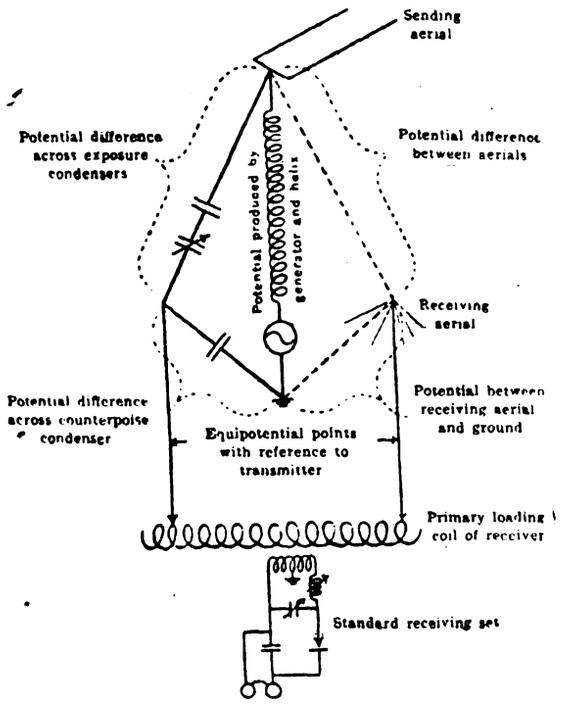
Mr. Kilburn-Scott prefers to make the upper part of the furnace in the form of a boiler upon which the blown electric arc acts much the same as an ordinary flame. The centre of the flame is the neutral point, and the boiler being earthed there is no disturbance in the electric connections. The metal of the boiler is not attacked by nitric oxide (NO). It might be so by nitrogen peroxide (No_2) at a tmeperature below 600 deg. C. The attack, however, is slow, and necessitates the presence of humidity.

The generally accepted production for single-phase furnaces is 50 to 60 grammes of nitric acid, pure, per kilowatt-hour, corresponding to one metric ton of acid per kilowatt-year. With three-phase furnaces, Kilburn-Scott obtained a 50 per cent. greater efficiency. By placing a boiler above the furnace the same author states that about 10 per cent. of the total energy can be recovered.

The voltage is about 1,500 volts. With properly working furnaces one can obtain a power factor of 0.5. The most commonly utilised system of absorption is constituted by a series of high towers, built of bricks, acid proof, and filled with quartz pebbles or other materials which resist acids. The first condition to obtain good absorption is a very slow circulation of the gases. The surface of contact must also be as great as possible. Moscicki runs the liquid down, intermittently, so that the substances in contact will be alternately wet and dry. This, it appears, greatly improves absorption (97 per cent.), and gives nitric acid with a concentration of 40 to 50 per cent.

DUPLEX WIRELESS TELEPHONY AND SELECTIVE RECEPTION.

The first part of a paper which was read by Mr. E. F. W. Alexanderson before the Institute of Radio Engineers, N.Y., deals with duplex wireless telephony, and the second part with a highly selective "barrage" receiver. In the duplex method described, the speaker can hear the called party without manipulating a switch to transfer from sending to receiving. For this to be possible it is necessary to neutralise the intensity of the transmitted signal, and the first method that yielded



Sending aerial
Potential difference across exposure condensers
Potential difference between aerials
Potential produced by generator and coils
Receiving aerial
Potential difference across counterpoise condenser
Equipotential points with reference to transmitter
Potential between receiving aerial and ground
Primary loading coil of receiver
Standard receiving set

DUPLEX WIRELESS TELEPHONY WITH CAPACITATIVE NEUTRALISATION.

practical results was the use of separate sending and receiving antennæ, located sufficiently far apart that the selectivity of ordinary receiving instruments could differentiate between the wave lengths of the receiving and sending stations. The subscriber and sending stations are connected like two ordinary subscribers on a central exchange, with the only difference that a transformer with its primary winding connected across the line from the receiving station is, by its secondary, permanently introduced in series with the line to the sending station. A telephone current originating in the receiving station is thus transformed into a current flowing in the closed circuit between the subscriber's instrument and the instrument in the sending station. A telephone current originating in the subscriber's instrument will follow exactly the same path. Both these currents will, therefore, be transmitted by the sending station, and both sides of the conversation may, in fact, be heard by a third party tuning his apparatus to the two wave lengths. This system is suitable for inter-connection with wire telephone exchanges.

The most practical method consists in mounting the sending and receiving antennæ on the same masts, and preventing mutual interference between them by inductive or capacitative neutralisation. In the former method, an inductive coupling is provided between the two aerials by a transformer connected in such a manner that it creates in the receiving antenna a potential opposite in phase to the potential directly induced by the sending antenna. The second (capacitative neutralisation) method is explained by the figure.

The bridge receiving set connections are analogous to a Wheatstone bridge. By adjusting the condensers in the bridge arms extremely perfect neutralisation is possible of the effect of one antenna on the other. Local strays may be effectively neutralised by intercepting them on a wire loop in the neighbourhood of the receiving set and impressing the potential so generated on a little coil mounted with an adjustable coupling close to the secondary loading coil of the receiving set.

The "barrage receiver" is a highly directional combination of aperiodic antennæ with unilateral directional characteristics. When two antennæ are used, the phase difference of the received currents depends on the direction of the incoming signals. By phase-shifting devices and differential coupling to a common receiver the signals from any given direction can be balanced out. Each antenna is connected to earth through an intensity coupler, the secondary of which is connected to the primary of a phase adjuster, built in the form of an induction regulator. The primary current is connected in split phase so as to produce a rotating field that cuts the secondary windings. The neutralisation of the signals from any particular direction is effected by adjustment of the intensity couplers and phase adjusters.

An experimental set was erected three miles from the New Brunswick station, the wave length of which is 13,600 metres. Nevertheless, signals from Carnarvon, Wales, with 14,200 metres wave length, were received, the signals from the New Brunswick station being entirely eliminated, notwithstanding their intensity and small difference in wave length. By using a double set of phase adjusters, signals from two stations in different directions may be neutralised simultaneously.—*Technical Review.*

SOME DEFECTS IN ELECTRODEPOSITED IRON.

BY W. E. HUGHES, B.A.

(*Abstract of paper read before the* IRON AND STEEL INSTITUTE.)

THE electrodeposition of iron has lately been employed to a considerable extent for the purpose of "building up" worn and under-gauge parts—both of aeroplanes and guns. This work has not been done under proper scientific control; and the observations made during this research show that results obtained in the workshop, though apparently satisfactory, are very far from being so in fact.

Microscopic and macroscopic examination shows that electrodeposited iron is subject to the following defects:—

1. Pin-holes.
2. Lumps (or roughness).
3. Inclusions (of foreign matter).
4. Cracks and quasi-cracks.
5. Differences of structure—at different parts of the same specimen.

Pin-holes (or "pits") are due to gas which is liberated by the current during electrolysis, and which adheres in the form of bubbles to the articles on which the deposit is being formed. The gas bubble acts as a screen or insulator. The deposit grows up round it, and thus a hole of circular cross-section is formed in the deposited iron. The bubbles are usually said to consist of hydrogen, and probably in the majority of cases that is so. It is necessary so to choose the conditions of deposition that hydrogen evolution is reduced to a minimum, and then to direct one's efforts to removing by mechanical means (agitation of the solution or movement of the articles being deposited upon) the gas formed and adhering to the work.

Lumps very often are caused by the plating solution containing tiny particles in suspension. Sometimes the lumps are rounded and smooth. This result is due to suspended particles having been initially present, and, after settling, having left the solution clear. A lumpy deposit of this kind will often be formed after a plating bath has been for some reason stirred up (*e.g.*, when new salts have been added), and sufficient time has not been allowed in which the sediment, that is always present at the bottom of plating baths, could settle down.

E

Digitized by Google

At other times a deposit will be *rough* to the touch. In this case, though the first settled particles have become covered, other layers are being continually formed. This kind of thing will result from the use of anodes that do not wear well, or, in the case of iron, from using anodes containing a high percentage of carbon. The effect on the structure is that it is of a more or less porous type, instead of being compact and dense.

Of the substances occurring as inclusions in electrolytic iron, the following are probably most often recurrent:—

(*a*) Oxide or hydroxide of iron, produced by oxidation of the solution.

(*b*) Hydrogen, produced at the cathode by electrolysis; and

(*c*) Carbon or carbide, that comes from the anodes used, or is derived from a constituent of the electrolyte.

Oxidation takes place quickly and extensively, even when the solution contains acid. The resulting oxide (or hydroxide) becomes disseminated throughout the solution by reason of its disturbance in the practical operations, and is caught up by the deposit. This defect is diminished—(1) If the bath continually contains sufficient acid to prevent the formation of any large amount of oxide (or hydroxide); (2) if the solution be allowed to "settle out," and be then siphoned, at frequent intervals; (3) if care be taken to disturb the solution as little as possible during the operations of putting in and removing the articles to be deposited upon.

Many writers have made statements to the effect that electrodeposited iron owes its brittleness (when it is brittle) to the fact that hydrogen is in some way or other included in the deposit. Such statements are quite inaccurate.

It remains unproven that the cause of brittleness (where it occurs) in electrolytic iron *is* the presence, in some form or other, of included hydrogen.

Carbon is found in electrolytic iron, but there is nothing to show that it causes any structural effect.

Electrolytic iron is commonly thought to be very pure. It may be, and it may not. The impurities, other than hydrogen, probably come, for the most part, from the anodes used. All impurities must be considered as causing the iron to be defective, and, from this point of view, the deposits obtained from solutions containing organic substances must be looked upon with suspicion. Cracks frequently exist, and they form a very serious defect in electrolytic iron.

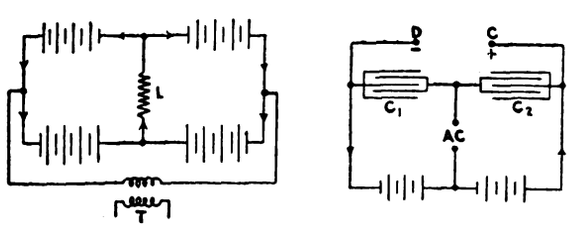
The manifold differences of crystalline structure that are to be found in electrodeposited iron must be accounted as a defect in it. Sometimes complete differences of structure will be found to occur in the same cross-section of one and the same sample.

These defects arise from causes which can be largely eliminated by efficient control and conduct of the deposition process.

It is believed that electrodeposited iron could be used with advantage to a much greater extent than it is at the present time, and that a great saving of material and expense would be effected by such extended employment of it. But the author is sure from long experience that if the electrodeposition process is to be used with success this will have to be done by methods and under workshop and other conditions that are much less lackadaisical and much more scientific than is at present the case.

METHODS OF REDUCING FLUCTUATION IN RECTIFIED CURRENTS.

Fig. 1 illustrates the circuit arrangements of the well-known Nodon system of aluminium rectifiers. Each cell consists of aluminium and lead or carbon plates immersed in a salt solution. T is the transformer through which the current is fed to the circuit, and L is the load. It is found that although this arrangement completely rectifies the current (at no time does it reach a zero value), the fluctuation is very large.



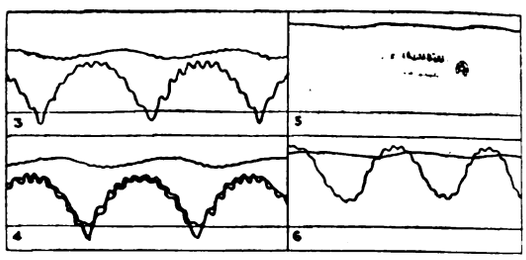
Figs. 1 and 2.—Circuit Arrangements for Aluminium Rectifier and Loads.

Two methods may be employed to "smooth out" the current: (*a*) the introduction of inductance in series with the load, and (*b*) the placing of a condenser in parallel with the load. The effect of the first method is shown in fig. 3, where the upper and lower curves represent the current and voltage respectively. In fig. 4 the curve which just touches the zero line represents the voltage when the load is a non-inductive resistance. The curve that falls slightly below the line represents the voltage with the same total resistance, and the addition of an inductance of 33 millihenries. The upper curve shows the current with the inductance in the circuit.

Fig. 5 is an oscillogram showing a current in the load of 2.5 amps. rectified with the four-cell combination shown in fig. 1. An inductance of 33 millihenries is placde in series with the load, and a 25 mf. condenser in parallel with it. The fluctuation has a maximum value of 1 per cent. of the mean current.

A high voltage can be obtained by employing the inductance without the condenser, but the current is small. This is illustrated in fig. 6. The curve showing the larger variations is the voltage without a condenser. The effect of connecting a condenser of 2.8 mf. capacity across the load is shown by the other curve.

The arrangement shown in fig. 2 makes it possible to obtain a direct E.M.F. more than twice as large as the effective value



Figs. 3, 4, 5, and 6.—Rectified Waves of Current and Voltage.

of alternating E.M.F. The condensers are of 2.8 mf. capacity. At the peak of one-half cycle one of the condensers is charged to the maximum voltage produced by the transformer; i.e., to 1.41 times the effective value of the voltage. The other condenser receives a similar charge at the peak of the next half-cycle. The two are in series, hence the p.d. between terminals D and C is $2\times1.41\times E$, where E is the effective value of the alternating E.M.F. This assumes the wave to be harmonic and leakage negligible.

We are indebted to the *Electrical World* for the foregoing details and accompanying diagrams.

LEGAL.

Bootle Corporation *v.* Bootle Cold Storage & Ice Co., Ltd.

In the Commercial Court of the King's Bench Division, before Mr. Justice Bailhache, on Thursday, May 20th, an application was heard in which the Mayor and Corporation of Bootle, Lancs., proceeded under the Courts (Emergency Powers) Acts, 1917-19, asking for the setting aside of a contract dated January 19th, 1912, for the supply of electricity for power to the Bootle Cold Storage & Ice Co., Ltd. The plaintiffs asked for the relief on the grounds that through the war and its attendant increases in the cost of coal, labour, &c., the whole basis upon which the contract had been entered into had been changed. Mr. A. T. Miller, K.C. and Mr. M. Bailey were for the applicants, and the defendants were represented by Mr. R. A. Wright, K.C., and Mr. W. Proctor.

Mr. Miller, K.C., in opening the case, said that there were sections under which the Courts Emergency Powers Act gave power to set aside contracts, the performance of which had become impossible or onerous through circumstances created by the war, and his submission would be that this was precisely the sort of case that the Act was intended to relieve, as through the war there had been an entire change in the trade conditions of the Corporation's electrical undertaking. The agreement with the defendant company was dated January, 1912, and it fixed the charge for power supply under two heads as follows: (1) To cover the capital and standing costs irrespective of the quantity used; this was based upon the plant capacity and was charged at £1 per kilowatt of demand per quarter. (2) To cover the running cost. This charge was made with respect to the electricity used as measured in Board of Trade units, and the rate was 0.375d. per unit. In the year 1917 the electricity works of the Corporation were declared a controlled establishment under the terms of the Munitions of War Act, 1915, and they had to be carried on under the Director of Electricity Supply. The consequence was that various new works and large extensions of works were constructed within the Corporation's area of supply at the instigation of departments of the Government, for the production of war material, and the Corporation had to furnish electricity for them, but the Corporation was unable to obtain any sanction to the extension of its area. In December, 1917, it was obliged to get a supply in bulk from the Liverpool Corporation at disadvantageous terms, and at a price that increased the cost beyond that which it would have been if the Corporation had been permitted to extend its works. From 11s. 3d. per ton in June, 1914, the price of coal had increased to 36s. per ton—an increase of 220 per cent— and

Digitized by Google

wages had risen by some 130 per cent. Figures supplied by the borough electrical engineer, Mr. T. Dawson Clothier, showed that for the year ending March 31st, 1915, the costs with respect to: (1) Capital and standing costs per kilowatt of maximum demand for all consumers were £1 12s. per kilowatt per quarter; and (2) the average running cost per unit of electricity sold to all consumers was 0.435d. per unit. The charge then made to the defendants of £1 per KW. and 0.375d. per unit were fair and reasonable, and in the year in question the undertaking showed a surplus of £3,014 over expenses, but for the year ending March 31st, 1919, very different results appeared, for the figures were: (1) Capital and standing costs, &c., £2 14s. 3d. per kilowatt per quarter; (2) average running cost per unit 0.84d., and a deficit of £7,670 resulted, although the charges for electricity were increased to every other consumer. Since March 31st, 1919, costs had risen still further, and the figures were: (1) Capital and standing costs, &c., £2 19s. 6d. per kilowatt per quarter; (2) average running cost per unit 1.06d. In the case of other consumers the charge for energy had been increased by 3½d. per unit for lighting and from 0.85d. to 1.7d. per unit for power. Mr. Miller, K.C., submitted that this was just the type of case that the Act intended to relieve. He relied on the words in the clause to the effect "alteration of trade conditions occasioned by the war . . . which involved serious hardship in carrying out the contract."

Mr. Clothier gave evidence, and was cross-examined by Mr. Wright for the defendants. He said it was true that the defendants had a reduced charge because they took the supply at a time when there would not be a general demand. They had a summer day load and used it in daylight. The Corporation had another pre-war contract with Harland & Wolf. Later contracts had a coal clause and a percentage clause. There was another cold storage company called the Union Co. now taking supplies. The coal clause meant an increase of over 100 per cent. on the basis price per unit. The bulk of the increased cost was for coal. Witness said that the defendants did offer to pay three-quarters of the coal clause increase dating back to 1918, which would involve an extra payment of £1,200.

Mr. Wright: If your contract is annulled you would not get that retrospective relief, you would have to start from now and make a new contract?—I suppose so, and they would be treated as new consumers.

I understand that in your arrangement with the other company (the Union Cold Storage Co.) you eliminated coal altogether for the purposes of determining if there has been an increase of cost of production, and then you charge a percentage to be settled by arbitration.—Yes.

His Lordship: And the percentage in that way might turn out to be very small on the total price?—Yes, it might turn out to be nothing at all.

Mr. Justice Bailhache: This agreement with the defendants really has only two years to run.

Mr. Miller: Yes, and the parties have been at loggerheads since 1917.

His Lordship said it would appear that if the Corporation allowed the defendants to go on the terms of their offer of three-quarters of the coal clause increase they would be on slightly better terms than were the Union Cold Storage Co.

Mr. Wright: Yes, they would start with 0.3d. instead of 0.375d.

Mr. Clothier explained that there were several differences in the basis on which the Union Cold Storage and the defendants were supplied—which were favourable to the defendants as compared with the other firm.

At the close of the evidence Mr. R. A. Wright said there were two alternatives—one was agreement between the parties, and the other was whether the circumstances were such as would justify the Court in annulling the contract. Mr. Wright said the position of his clients was that they had got a contract—they had offered to have the agreement revised to the extent of three-quarters of the coal clause increase with retrospective effect. The defendants' offer was retrospective. He submitted that the position could not be dealt with as if there was no contract at all. The Court must consider the fact that the contract existed. The Corporation's offer was after June, 1918, the whole of the coal increase and up to then three-quarters of it.

Mr. Miller, K.C., said the Corporation made a fair offer in December, 1917, that had been modified since. The defendants had brought the Corporation to Court to have the matter discussed, and he submitted the plaintiffs should have the costs in any event. It was agreed that the case should be adjourned until the following day for the parties in the meantime to discuss the matter with a view to an agreement, and Mr. Justice Bailhache intimated that subject to Mr. Wright's argument he thought that failing an agreement the contract should be annulled.

When the case was further mentioned, Mr. R. A. Wright, K.C., for the defendant company, announced that his clients had agreed to accept the offer of the Corporation, so that the contract by consent would be amended, increasing the contract price by three-quarters of the coal clause charges as from January 1st, 1918, to June 30th, 1919, and as to the whole of the coal clause charges from July 1st, 1919, to the end of the contract. As this was an application by the plaintiffs for relief, he submitted there should not be any costs on either side.

Mr. Justice Bailhache: I do not agree. I think the defendants were unreasonable in the matter. They forced the plaintiffs to come here, and defendants must pay the costs.

The contract was accordingly amended on the terms indicated, and the plaintiffs were given the costs of the proceedings.

Improvements in Electrodes for Secondary Batteries.

In the King's Bench Division, on Wednesday, May 19th, Mr. Justice Greer had before him an action relating to the commercial exploitation of a patent covering improvements in electrodes for secondary batteries (No. 120,671 of 1914-1915). The plaintiff was Mr. Herman Edward Gluck, of Priory Road, West Hampstead, and the action was brought against Mr. S. Willner, of Turle Road, Tollington Park, and Mr. Alfred Connell, Philpot Lane, London, plaintiff claiming damages for alleged breach of contract.

Plaintiff's case was that in February, 1916, Willner requested him to assist defendants with the necessary finance for commercially exploiting the patent. It was alleged that Willner stated to plaintiff that he was the owner of the patent, that he had sold the German and American rights, that he wanted to exploit the English, Colonial, and other foreign rights, and that the patent was held in trust for him by Connell, to whom he would have to allow a small interest for services rendered. In May, 1916, it was verbally agreed that plaintiff should provide the necessary finance for commercially exploiting the patent, and should take offices and register or obtain control of a company with limited liability, and that in consideration plaintiff should have in addition to payment of the money advanced and expenses incurred by him under the agreement, one-third share of the English and Colonial rights or one-third of the profits to be made from the sale of the patent. It was further agreed that Willner should act as secretary of the proposed company. Certain personal loans were made by plaintiff to Willner, who undertook not to dispose of his rights in the patent unless with the plaintiff's consent. Plaintiff said he advanced money and incurred expenses, and took offices at Wormwood Street, E.C. In May, 1917, Connell assigned the letters patent to a gentleman, who afterwards assigned them to the Apex Electric Accumulator Syndicate, Ltd., and plaintiff said he was entitled to one-third of the profit made by defendants from the sale.

The defendant Willner denied that he was interested in the letters patent as owner or partner or joint owner with his co-defendant Connell, or that he ever acted or had any authority to act as principal or agent as alleged. It was alleged by the defence that in January, 1916, Willner introduced plaintiff to the defendant Connell as a person who was able and willing to provide the capital required for exploiting the letters patent commercially, but plaintiff failed to find the required capital, and in August, 1916, Willner informed him that Connell would dispose of the letters patent. The defendant Willner denied that the agreement alleged by plaintiff was ever made.

The defendant Connell also pleaded that there never was any agreement at all between him and the plaintiff. The letters patent were granted to him and were eventually assigned to the Apex Electric Accumulator Syndicate, Ltd.

After hearing the evidence and counsel's address, Mr. Justice Greer said Mr. Willner's own evidence satisfied him that he knew Mr. Gluck was undertaking liabilities and meeting expenses in consideration of a promise made to him. He could not find that Mr. Connell was liable. The breach of contract was due to what Mr. Willner did. He had decided to give Mr. Gluck against Mr. Willner £100 beyond the £94 which the plaintiff had expended, and to which he was entitled, and there would be judgment against the defendant Willner for £194, and judgment for the defendant Connell.

The Belgian Charleroi Works.—The report for 1919 of the directors of the Ateliers de Constructions Electriques de Charleroi states that the expectations entertained a year ago regarding the resumption of production had been realised. It was possible for the Marcinella works, from which but little machinery had been removed, to make a fresh start in February, and in August the construction of large motors and lifting appliances was resumed at the works of La Villette. The foundry and pattern shop, which had not suffered any damage, were able to work on a normal basis as early as January, but the cable factory had been stripped of all the plant, and was only able to turn out the first cables and insulated wires in September. The equipment of the cold rolling mill had been recovered, and its installation was practically completed, whilst it was hoped to start the new shops for tubes and insulating material in a short time. In addition, the construction of small motors in bulk had been begun at Ruysbroeck, where the signal department was to be transferred from La Villette. Although orders of any importance were not booked until the end of May, the value of the orders received in the whole of 1919 was 45,454,000 fr., and the present year promised to be still more favourable. The accounts for last year show profits of 2,546,000 fr., but after deducting the loss of 2,337,000 fr., incurred in the years 1915 to 1918, the sum of 209,000 fr. remains to be carried forward to 1920.

CORRESPONDENCE.

Letters received by us after 5 P.M. on Tuesday cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Policy of the E.P.E.A.

With reference to letters in your issue of May 21st, written by "Sic Itur" and Mr. Jones, Secretary E.P.E.A., I should like to ask them: (1) How many of their members receive the awards they claim for? (2) Have they cleared their minds as to whether they are what they claim to be, viz., genuine trade unionists? (3) If they have, why do they want confirmation at the hands of the T.C.P.C.?

And, further, all their claims are based on the basic rates obtained by the E.T.U., the members of which get what they are awarded. Mr. Jones in his letter does not state that he was absolutely forced to publish something of the sort by a trade union, as a result of two conferences with the E.T.U., at one of which I was present. And the defence they put up was pathetic. There is only one thing for the E.P.E.A. to face, and that is absorption by the E.T.U.

W. E. Weston,
No. 1 Station Engineers, E.T.U.

London, S.E., *May 20th*, 1920.

Electrical Japanning Ovens.

I was expecting to see some comment re the above, and the following will answer Mr. W. M. Mason's ten questions:—

No. 1.—Fittings in gas stove replaced with electric fittings.

No. 2.—See "Electric Japanning Ovens" (Electrical Review, April 23rd).

No. 3.—The same exhaust flue in use for electric stoves as for gas stoves.

No. 4.—Sufficient to complete the stoving of the work in the ovens.

No. 5.—Long enough to turn out a satisfactory job.

No. 6.—Yes.

No. 7.—To regulate gas-heated stoves requires more care than is required in switching off electric current.

No. 8.—Electric heaters.

No. 9.—Sufficient for the work in the ovens according to the temperature required.

No. 10.—See answer No. 2.

I am not certain what is implied by the term "nigger," but Mr. Mason can take it for granted that my electric stoves are not "white elephants."

Alfred Rider.

Hull.
May 18th, 1920.

BUSINESS NOTES.

Small Electric Lighting Sets for Cuba.—The D.O.T. has received a report from the Commercial Secretary to H.M. Legation at Havana (Mr. G. T. Milne, O.B.E.) stating that there is an opening for the sale of small electric lighting sets of British manufacture. Already some American manufacturers are in the Cuban market, which is not a very large one, but British manufacturers should be able to secure orders, provided they can supply a suitable type of lighting set. It is suggested that firms interested should forward catalogues, lists, &c., to the Commercial Secretary, British Legation, Havana, Cuba, indicating at the same time the present prices and conditions of delivery.

Illuminating Engineering Society. — The Council's report for the 1919-20 session was presented at the annual meeting of the Society, held on May 11th. The arrangement by which positions on the Council are held by the presidents of kindred societies has been extended to include the Illuminating Engineering Society of the U.S.A., the Institution of Electrical Engineers, the Institution of Gas Engineers, the Illuminating Engineering Society in Japan, the Council of British Ophthalmologists, the Ophthalmological Society, the Physiological Society, the Electrical Contractors' Association, and the Association of Railway Electrical and Telegraph Engineers. A list of the subjects dealt with at meetings of the Society includes "Colour-Matching by Natural and Artificial Light," by Mr. L. C. Martin; "Lighting Conditions in Mines, with Special Reference to the Eyesight of Miners," by Dr. T. Lister Llewellyn, as well as reports of Committees, &c. Among the questions investigated by Committees was "Eyestrain in Kinemas," an inquiry entered upon at the instance of the London County Council. Committees were also set up to report upon railway lighting, and progress in lamps and lighting appliances.

Dual Tickets.—The *Journal* of the National Association of Supervising Electricians for May gives correspondence between the Association and the E.T.U. in which the former asked whether the latter would countenance joint membership of more than one Trade Union. The E.T.U. replied that the Executive Council had definitely decided that no member of the E.T.U. could hold two Trade Union tickets.

Motor Fuels Committee.—The Imperial Motor Transport Council, of which Prince Arthur of Connaught is President, and the Hon. Sir Arthur Stanley chairman, has appointed an Empire Motor Fuels Committee under the chairmanship of Mr. E. S. Shrapnell-Smith. The terms of reference are the following:—

1. To take immediate steps to encourage and develop the production and utilisation of additional motor fuel supplies and of raw materials therefor in all parts of the Empire, and more particularly to ensure increasing shipments of motor fuels to Great Britain, and, so far as may be necessary, to the Empire Overseas.

2. To co-operate with any Government or incorporated or unincorporated body of persons in order to further the objects set forth in (1) hereof.

3. To offer for the purposes in view bonuses or other rewards and to incur such expenditure as may be desirable, all such expenditure being subject to the approval of the Council.

Captain F. G. Bristow, F.C.I.S., will give his services as secretary to the committee, and any communications are to be addressed to him at 50, Pall Mall, London, S.W. 1.—*The Times.*

Tests on High-Pressure Box Compound.—Very good results were recorded in a recent report by the National Physical Laboratory on "Berry's" high-tension box compound, supplied by the Premier Bitumen and Asphalte Co., Ltd., of Stratford Market, London, E. 15. We understand that a cube of the material to meet Admiralty requirements, placed in a metal box, was immersed in boiling water for 30 minutes, and fulfilled the requirements of the specification. The material was then subjected to a pressure of 2,000 volts between electrodes placed $\frac{1}{16}$ in. apart, for half-an-hour, without breakdown, and when tested again under a temperature of 100° C. for a period of half an hour, an alternating pressure of 2,000 volts was withstood. Two 2-in. cubes of the compound were immersed in distilled and sea-water for a week, and showed an increase in weight of '06 per cent. and '04 per cent. respectively; the specification stated that the weight of neither cube was to be increased by more than '5 per cent.

Three 8-Hour Shifts at Sheffield.—In response to an application by five societies representing the steam service men, the Sheffield and District Engineering Trades Employers' Association have decided to put into operation Award 84 on May 30th. This means that the three eight-hour shifts system will be worked by over 10,000 men, instead of two shifts per day. This arrangement is expected to increase employment and abolish overtime.—*Times.*

Dynamo Manufacturers' Amalgamation.—An amalgamation of interests has been arranged between the Lancashire Dynamo and Motor Co., Ltd., of Manchester, and the Crypto Electrical Co., Ltd., of Willesden. It is intended that all machines below about 10 H.P. shall be manufactured at the Willesden Works, and that machines above this size shall be manufactured at Manchester. Special arrangements have been made to meet the requirements of customers who require to duplicate existing machines of either make.

The Crypto Electrical Co.'s works at Willesden are being extended to double their present size. The extensions are practically complete, and a greatly increased output will be available within a short time. It is hoped that the extensions will ensure the production of approximately four times the existing output of motors from about ¼ B.H.P. up to 10 B.H.P.

The selling organisations of the two companies have been combined throughout the British Isles. The associated firms have branch offices in London, Glasgow, Newcastle, Birmingham, Dublin, Cardiff, and Bristol, and full information regarding the products of both works can be obtained from any of these offices, or from the head offices and works of either firm.

The directors are confident that the increased efficiency obtained by limiting the range of manufacture of each works will greatly increase the combined output, with corresponding benefits in regard to price and delivery.

Canadian Exhibition.—Sir George Perley, K.C.M.G., High Commissioner for Canada, will open the Exhibition of Canadian Products at the Royal Agricultural Hall, Islington, on Thursday, June 3rd, at 12 o'clock. The Exhibition will be open from 11 a.m. to 9 p.m., and will close on June 17th. Up to 2 p.m. each day the Exhibition will be open to traders only. After that hour the general public will be admitted.

The exhibits include iron and steel products, minerals, chemicals, tools, sheet-metal goods, agricultural machinery, furniture, provisions, confectionery, footwear, musical instruments, building materials, &c.

Employment for Disabled Men.—In an endeavour to find work for the 630 disabled ex-Service men at present unemployed in Greater Manchester, local ex-Service Associations recently called a meeting, inviting the men and about 30 employers. This resulted in placing about 60 men in employment. Further steps are being taken, including the sending of a circular letter to all employers in the district. When this task is ended, efforts will be made to secure employment for the other unemployed ex-Service men—about 6,000 at present.

Digitized by Google

National Joint Board of Employers and Members of Staff (Electricity Supply Industry).—We have received from the Secretary of the Electrical Power Engineers' Association a pamphlet containing an account of the constitution and functions of the National Joint Board, which was formed on December 12th, 1919. A list of members of the Board is given, Ald. W. Walker being the chairman, and Mr. J. H. Parker, vice-chairman; the secretary is Mr. A. C. Tappenden, 1 and 2, Great Winchester Street, E.C. 2. In addition to Ald. Walker, the representatives of the I.M.E.A. are Ald. A. R. Jephcott, M.P., Ald. E. Vaughan, Bailie W. B. Smith, Mr. H. Faraday Proctor, and Ald. J. A. G. Beaumont; the Incorporated Association of Electrical Power Companies is represented by Messrs. R. P. Sloan, C.B.E., and W. B. Woodhouse; the Conference of the Chief Officials of the London Electric Supply Companies by Messrs. F. Bailey and F. J. Walker; and the Provincial Electric Supply Committee of the United Kingdom by Messrs. K. A. Scott-Moncrieff and J. C. Wigham. For the employés, the E.P.E.A. is represented by Messrs. J. H. Parker, W. J. Cooper, G. W. Essex, A. L. Lunn, W. A. Jones, and J. W. Thomas; and the Electricity Supply Commercial Association by Messrs. P. Burr, N. A. Chesterfield, W. Goodson, P. R. Jackson, G. R. Smith, and A. J. Squire. Meetings are held monthly. Areas for 13 District Joint Boards have been defined, covering Great Britain. The organisation is based upon that of the Whitley Councils, and the object is to secure the largest possible measure of joint action between employers and members of the staff for the safeguarding and development of the industry, and for the general improvement of conditions, with a view to promoting the best interests of all parties. The functions and procedure of the Board are fully set out in the pamphlet.

We have also received a pamphlet, dated May 12th, defining the "conditions of employment and schedule of salaries for technical engineers on the staffs of electricity supply undertakings." It is stated that the Board has been officially recognised by the Ministry of Labour as the competent authority to deal with all matters affecting salaries and conditions of employment, and that the Board has agreed to the conditions and schedule, which apply to all members of the technical staffs from "student engineer" up to and including the deputy chief official.

The conditions define the "week" as consisting of 48 hours, and cover the questions of temporarily increased responsibilities, sick leave, holidays, termination of employment, &c. The schedule is based upon plant capacity, which is closely defined; undertakings are graded in nine classes, from 1,000 to over 100,000 KW., and there are four basic grades:—(1) Deputy chief official; (3) power station superintendent; (3) mains superintendent; and (8) shift charge engineer. Intermediate grades are provided in the schedule. The total rate of salary and bonus, as at March 1st, 1920, is adopted as a basis of calculation. The salary of a shift charge engineer in the lowest size of station scheduled is to be £293 per annum, or more if he is already paid at a higher rate. The salaries are subject to re-adjustment in proportion to the official figures as to cost of living. The conditions and schedule come into operation as from May 21st, or June 1st, 1920. We print the schedule herewith. No doubt copies of these pamphlets will be in great demand from the secretary during the next week:—

SCHEDULE OF SALARIES.
PLANT CAPACITY IN KILOWATTS.

Grade.	Class A. 1,000—2,000	Class B. 2,001—4,000	Class C. 4,001—6,000	Class D 6,001—8,000	Class E. 8,001—10,000	Class F. 10,001—30,000	Class G. 30,001—50,000	Class H. 50,001—100,000	Class J. 100,001 and over.

The Coal-Mining Industry.—In the May issue of the *Industrial League and Council Journal*, Mr. David Gilmour, O.B.E., general secretary of the National Democratic and Labour Party, who has seen upwards of 40 years' service in connection with the coal mining industry of Great Britain, shows how it is impossible for this industry to be developed to any appreciable extent while the seven-hour working day is in operation. He points out that in 1913 the output from British coalfields was 287 million tons, and had not the war supervened, it would to-day have been at least 300 million tons per annum. Under existing conditions it will work out at about 240 million tons, and the sad fact is, that if the field could only be brought up to 300 million tons the terrible tragedy of the gradual and persistent ever-increasing cost of living would be abated, if not eliminated altogether. Mr. Gilmour says: "My suggestion is, therefore, that it should be made worth the while of the miners to consider reverting to the eight-hours day for the period of one year on trial, and for the extra hour worked they might be paid a higher rate, as for overtime. Supposing the concession of £1 per week higher wage was granted for the extra time, this would absorb about £50,000,000 per annum of the extra £150,000,000 derived from 60 million tons additional exports, leaving a surplus of £100,000,000 yearly, which could be utilised to reduce the price of coal for industrial purposes, and bring down very considerably the charge for house coal. If this could be achieved, British trade would have such an era of prosperity as we have never previously enjoyed."

Training Ex-Service Men.—Sir Montague Barlow, Parliamentary Secretary to the Ministry of Labour, recently stated that the number of ex-Service men in training was 22,856, and the number waiting 24,880. The number already trained was 20,633, including 11,000 trained under the direction of the Ministry of Pensions.

Society for Electrical Development, U.S.A.—The above society has elected Mr. W. W. Freeman to the position of president, while the general manager, Mr. J. Wakeman, and the secretary-treasurer, Mr. James Smieton, jun., have been re-appointed.

Book Notices.—"Public Opinion in Preventive Medicine." Price 4d.; post free 5½d.—The Lady Priestley Memorial Lecture delivered by Sir George Newman, K.C.B. (Chief Medical Officer, Ministry of Health), before the National Health Society, on April 22nd, 1920, has been issued as an attractive little book of 30 pages. Everyone should read this illuminating little book, for the health and well-being of the community are of national importance. Teachers, in particular, can do much to impress upon their pupils the importance of the observance of simple and elementary precautions to avoid disease, of proper food, fresh air, and exercise. Copies of the booklet are obtainable from all booksellers and from H.M. Stationery Office.

"Controllers for Electric Motors." By H. D. James. Pp. xiv + 354; figs. 259. London: Crosby Lockwood & Son. Price 21s. net.

"The Real Wealth of Nations, or a New Civilisation and its Economic Foundations." By J. S. Hecht. Pp. viii + 350. London: G. G. Harrap & Co. Price 15s. net.

"Armature Winding." By C. Sylvester. Pp. xii + 171; figs. 129. London: S. Rentell & Co., Ltd. Price 7s. 6d. net.

"Vickers News." Vol. II, No. 16. Pp. 20.—The present number of this interesting journal includes further articles on the Cairo to the Cape and the trans-Atlantic flights, as well as a description of submarine construction at Barrow.

MESSRS. W. & G. FOYLE, LTD., 121-125, Charing Cross Road, W.C. 2, have sent us a catalogue of new and second-hand technical books (39 pp.). Divided into subject-divisions, the volumes are classified under authors' names, and the published and present prices are given in each case. The subjects range from "Aeronautics" to "Brewing," and the "Electricity" division contains nearly 200 works; dates of publication, however, are omitted.

"Problems in Physical Chemistry." By E. B. R. Prideaux. Pp. xii + 294. London: Constable & Co., Ltd. Price 18s. net.

"Cheap Steam." Vol. IV, No. 3. Pp. 16. London: Ed. Bennis and Co., Ltd.—The May issue of this journal contains several articles of interest, including notes on boilers at iron and steel works, and a description of plant at the works of Messrs. W. & R. K. Lee, Ltd., Sowerby Bridge.

"The *Bulletin* of the Hydro-Electric Power Commission of Ontario." Vol. VII, No. 4. April, 1920. Pp. 32.—This issue is well illustrated, and contains a long article upon the Lincoln demand meter, and a description of the Nipigon power development.

Factory and Plant for Sale.—By direction of the Disposals Board Ministry of Munitions, the Controller of Land and Factories is offering for sale by private treaty H.M. factory and power house at Langwith, Derbyshire, the ground area of buildings cover about 145,000 ft., the power installation consisting of producer gas engines and generators, capable of developing 11,000 H.P. or 7,400 KW. Peterborough Corporation Electricity Department invites offers for one 240 cell, complete with boxes, trays and insulators. Full particulars are given in our advertisement pages to-day.

Catalogues and Lists.—MESSRS. SIEMENS BROS. & CO., LTD., of Palace Place Mansions, Kensington Court, W. 8, are distributing a new coloured showcard of their "Stannos" system of wiring, illustrating the inconspicuous nature of the work in the mansion, and drawing attention to the inexpensivness of the system in the cottage, and to its other advantages. The simplicity of the new way as compared with the old is shown. Merchants, contractors, and traders can have copies of the showcard on application.

BRITISH BRASS FITTINGS, LTD. (Proprietors of Sperryn & Co., Chas. Joyner & Co., Ingram & Kemp, and Player & Mitchell), Moorsom Street Works, Birmingham.—Catalogue Edition B E1. (157 pp.). Beautifully produced on art paper, and profusely illustrated. Dealing chiefly with electroliers and other electric lighting fittings. Fully priced.

MESSRS. ALFRED HERBERT, LTD., Coventry.—Section E 6, a 16-page illustrated, priced and dimensioned list of turret-lathe tools and accessories of all descriptions.

MESSRS. GALLOWAYS, LTD., Knott Mill Iron Works, Manchester.—Two well-produced and illustrated catalogues. "Large Gas Engines" (39 pp.), and "Uniflow Steam Engines" (17 pp.), giving detailed descriptions and specifications.

MESSRS. DONOVAN & CO., 47, Cornwall Street, Birmingham.—An illustrated and priced sheet of electrical accessories, including tumbler switches, cut-outs, bells, accumulators, insulators, jointing materials, &c.

MESSRS. W. CANNING & CO., 133-137, Great Hampton Street, Birmingham.—A booklet entitled "Linking the Past with To-day, 1785-1920." (32 pp.).—This gives a brief history of the firm, and is copiously illustrated by photographs of persons and premises.

Mr. D. C. BATE, 16, John Dalton Street, Manchester.—A four-page list setting forth the advantages of the "Bipol" accumulator, giving prices and details of working costs compared with dry batteries.

MESSRS. DRAKE & GORHAM WHOLESALE, LTD., 67, Long Acre, W.C. 2.—Pamphlet No. 288 describing and illustrating the "Silent Alamo" 1-KW. house lighting plant.

Digitized by Google

Liquidations and Dissolutions.—SIGNAL ELECTRIC CO., LTD.—Winding up voluntarily. Liquidator, Mr. G. L. Winn, c/o Bristowe & Co., Ltd., 11, Tothill Street, S.W. A meeting of creditors was held at Cannon Street Hotel on May 26th.

The following is a list of the principal creditors :—

Fisher & Ludlow, Ltd.	£603	H. K. Brownrigg, secretary (salary)	£46
W. & J. Dangerfield (judgment, including costs)	896	D. Gilson & Co.	39
Abbey Industries, Ltd. (contract amount)	218	W. E. Baker	94
Jas. Cartland & Sons, Ltd. ..	169	Leopold Norman (commission)	22
Ephraim Phillips	169	H. Drewitt, a director (expenses, &c.)	21
Drycells, Ltd. (judgment including costs)	114	S. A. Bailey, solicitor (costs, approx.)	20
R. E. H. Lovelace (including salary)	113	C. D. Flint..	18
Walthamstow Urban District Council (rates)	99	Lea Bridge Gas Co. (deposit, £5, held)..	14
Concordia Electric Wire Co. (judgment, including costs)..	82	C. St. John, a director (balance of account)	13
John Matthey & Co., Ltd. (contract amount)	80		£2,380
British Insulated and Helsby Cables, Ltd.	68	CONTINGENT LIABILITIES.	
		Pref. share interest, approx. ..	134
		Directors' fees, approx. ..	637
			£3,151

The loss for the period from May 31st, 1919, to May 5th, 1920, was £4,375.

GLOBE ELECTRIC CO., LTD.—In this liquidation Mr. W. Osborne is acting as liquidator in place of the late Mr. G. E. Corfield. We understand that a small dividend is available.

THACKER BELL & Co.—Particulars of claims must be sent by June 30th to Messrs. Woodcock, Rylands & Parker, 15, Bloomsbury Square, W.C., solicitors to the liquidators.

THE BRITISH ELECTRICAL ACCESSORIES, LTD., Fawcett Row, Bradford.—In pursuance of Sec. 188 of the Companies (Consolidation) Act, a meeting of the creditors of the above was held on May 21st, at the offices of Mr. F. W. Rhodes, solicitor, Cheapside, Bradford. A statement of affairs was presented by Mr. W. A. Judge, I.A., the liquidator of the company, which showed liabilities of £9,122. The assets were estimated to realise £2,281, from which had to be deducted £192 for preferential claims, leaving net assets of £2,089, or a deficiency as regarded the unsecured creditors of £7,034. The issued share capital of the company was £965, and as regarded the contributories there was a deficiency of £7,999. The liquidator stated that the company went into voluntary liquidation on May 5th of the present year, as it was unable to meet its liabilities. The following day the Sheriff attempted to enter into possession, but the liquidator's title held good, and the Sheriff retired. With regard to the unsecured liabilities, it appeared that about £4,000 was in respect of moneys advanced. During the year to April 30th, 1918, the trading resulted in a profit of rather more than £1,300, and at that date the assets were valued at £7,400. During the following 12 months there was a loss on the trading of between £400 and £500. Further accounts had been prepared covering a period of 23 months to March 31st, 1920. It was estimated that the stock at the commencement of the period was £3,981, while at the close it amounted to £1,330. The trading appeared to have resulted in the 23 months in a net loss of rather more than £5,600, while in the period the purchases aggregated £16,615, against sales of £17,425. The company was formed in May, 1914, with a nominal capital of £1,000 in £1 shares, but in view of last year the capital was increased to £15,000. The position disclosed was discussed at some length by the creditors, and eventually it was resolved to confirm the voluntary liquidation of the company, with Mr. Judge as liquidator, and a Committee of Inspection was appointed, consisting of the representatives of Messrs. Driver, Drennan & Cooper, Ltd., W. Sanders & Co., W. D. Wilson, J. H. Rushworth, and Parkin S. Booth.

COALITE, LTD., and BRITISH COALITE CO., LTD.—Meetings are called for June 30th, at 62, London Wall, E.C., to hear an account of the winding-up by the liquidators, Messrs. H. Bacon and J. H. Macaulay.

ENDALL & SOTHERAN, electrical, mechanical, and automobile engineers, Canal Motor Works, Canal Bridge, Church Street, St. Helens.—Mr. G. W. Endall and Mr. A. W. Sotheran have dissolved partnership. Debts will be attended to by Mr. G. W. Endall, who will continue the business at the same address, under the style of Endall & Co.

A Glasgow Exhibition.—We have received an advance prospectus of the Shipbuilding, Engineering, and Electrical Exhibition which is to be held in the Kelvin Hall, Glasgow, from November 8th to December 4th, 1920. The Exhibition is being promoted by the Corporation of Glasgow with Mr. J. M. Freer, as general manager, and applications for space are now being received. The Engineering Section will include prime movers, traction, mechanical devices, and models. The Electrical Section will cover instruments, magnetos, dynamos, and wireless apparatus. Other sections will be :—Shipbuilding, motor boats, motor cycles, and miscellaneous (including all articles applying to the foregoing trades). The prospectus contains rules and regulations, particulars of space, charges, specimens of stands, and information relating to the Kelvin Hall.

A South African Steel Corporation.—It is announced that the South African Iron and Steel Corporation, Ltd., has been registered at Cape Town, with a capital of £1,500,000.—*Times.*

Bankruptcy Proceedings.—F. MITCHELL (F. Mitchell and Co.), electrical engineer, Manchester.—Discharge suspended for two years until April 27th, 1922.

E. CLONEY, tramways divisional traffic superintendent, 5, Albans Road, N.W. 5.—Second dividend of 5s. in the £, payable at Carey Street, W.C.

Auction Sale.—MESSRS. P. HUDDLESTON & Co. will sell by auction, on June 7th, at Dalling Road, Hammersmith, a quantity of electrical apparatus, including dynamos, motors, generators, &c. For full particulars, see our advertisement pages to-day.

Catalogues Wanted.—MR. E. AMES, consulting electrical engineer, 12, Whitehall Crescent, Dundee, having closed his office at the beginning of 1915 to join the B.E.F., has re-opened to continue his practice. He will be glad to receive catalogues, price lists, and any particulars from electrical manufacturers, gas and steam engineering firms.

Trade Announcements.—MR. F. LAW, electrical engineer, contractor and automobile electrician, of Grove Gardens, Headingley, Leeds, has opened premises at Tower Buildings, Ilkley, and invites manufacturers to send catalogues, lists, &c.

BUCK & HICKMAN, LTD., announce that their Birmingham warehouse and offices have been removed from 55, Station Street, to 23, Newton Street, Corporation Street, Birmingham.

THE JACKSON ELECTRIC STOVE CO., LTD., have removed their showroom and offices from Blandford Street to 143, Sloane Street, London, S.W., and all communications should be sent there.

As from May 31st the telephone number of the West End depôt (Arthur Street, New Oxford Street, W.C. 2) of POPE'S ELECTRIC LAMP CO., LTD., is changed from "Gerrard 3000" to "Gerrard 6074" (two lines). Larger stocks will be held there.

Gas Regulation Bill.—The text of the Bill recently introduced into Parliament by the President of the Board of Trade has now been published. This Bill seeks to fix the quality and price of gas, to institute penalties for deficient values, and to set up the means of making periodical tests. One of the alterations suggested in the present practice of gas undertakings is a system of charging according to the heat value of the gas supplied.

Plant for Sale.—City of Gloucester Electricity Department has for disposal one 150-KW. Belliss-Silvertown generating set, two Blake-Knowles and one Summers 10,000 lb. Scott steam-driven jet condensers. See our advertisement pages to-day.

Liverpool Corporation Electricity Supply Department has for disposal two 2,000-KW. Westinghouse-Parsons turbo-alternators with condensers, air and circulating pumps, &c. See our advertisement pages to-day.

Fire.—Early on Whit Monday morning fire broke out in the power house of Messrs. Brown's engineering works in Chapman Street, Byker, Newcastle-on-Tyne, and considerable damage was done to the installation.

Trade Openings in Italy.—The British Chamber of Commerce for Italy (Inc.), whose headquarters are at Genoa, have issued a lengthy list of openings for British firms to do business with Italian purchasers and agents.

Strike at Liverpool.—Cable jointers employed by the Liverpool Corporation are on strike for the same conditions as obtain in the building section of their Union. About 100 men are affected.

Dispute in Wimbledon Electricity Department.—According to statements issued by the E.P.E.A., a recommendation that the award of the National Joint Board for the Electricity Supply Industry of an increase of salary to station engineers of £30 per annum from January 1st, 1920, was submitted by the Electric Lighting Committee to the Wimbledon Town Council ; the matter was referred to the Staffing Committee, and on the advice of the latter, the Council rejected the recommendation. The technical staff members have, therefore, given notice that they will cease work on Monday, May 31st, unless the Corporation adopts the recommendation of the Electric Lighting Committee, and the executive council of the E.P.E.A. is prepared to support the local members.

Copper and Lead Prices.—Messrs. F. Smith & Co. report May 25th :—Electrolytic copper bars, £109, £5 decrease ; electrolytic wire rods, £124, £5 decrease ; electrolytic H.C. wire, 1s. 4d., ¼d. decrease ; silicium bronze wire, 1s. 11¾d., ¼d. increase.

Messrs. James & Shakespeare report May 26th :—Copper bars (best selected) sheets and rods, no change. English pig-lead £41 10s., an increase of from 10s. to 30s. on the week.

Juvenile Employment.—The fourteenth annual report of the Skilled Employment and Apprenticeship Association has recently been published. Fifteen Committees were affiliated during the period covered by the report, but seven of these have announced their inability to carry on owing principally to the lack of funds and voluntary workers. The Association has been approached with a view to its taking over the management of the East London Apprenticing Fund, established some years ago by the late Lord Swaythling to provide loans for non-Jewish boys residing in the Tower Hamlets entering trades. The Association has expressed its willingness to take over this fund. The office of hon. treasurer has been taken over by Mr. Alfred P. Griffiths. The expenditure for the year exceeded the income by £65, but an appeal for funds is being made, and it is hoped to secure a number of regular subscribers. The Association was successful in finding places for 40 per cent. of the boys who applied and 47 per cent. of the girls, the same proportion as in 1918.

Turkey.—The report of the Société des Tramways et Electricité de Constantinople for the year ending June 30th, 1919, which has only just been issued, states that the year 1918 proved an exceedingly difficult one for the company owing to the scarcity of coal, and the need for tramway material, the service having for these reasons to be suspended for a certain period of time. Thanks to the influence of the Allied missions the tram fares have been greatly increased, which has considerably improved the running conditions. The demand for current is steadily increasing, but the company is not yet in a position to satisfy all the demands owing to it not being possible to promptly secure the necessary material.

New French Company.—La Société des Electrodes de la Seine is the name of a new company which has lately been formed at Paris (2 Rue Blanche), with a capital of 2,000,000 fr., to manufacture electrodes of all kinds.

Italian Company Note.—The shares in the Società Bolognese di Elettricita, of Bologna, which have hitherto been mainly held in Belgium, have been acquired by an Italian syndicate, so that the concern shall become a purely Italian undertaking.

LIGHTING AND POWER NOTES.

Birmingham.—Proposed Extensions.—The Electricity Supply Committee recommends the City Council to approve of the extension of the Nechells station at an estimated cost of £1,757,700. In 1918 authority was given for the erection of the first portion of the station and works at an estimated cost of £1,626,140. The capacity of this new plant is 30,000 KW. It was anticipated that the new station would be in commission for the winter 1920-21, and the principal contracts were placed early last year; but owing to labour disputes which prevented deliveries of material, the station will not be ready for duty before the winter of 1921-22, except possibly to a partial extent. There is at present no reserve plant. The simultaneous maximum daily load on the works during the past winter was about 63,250 KW. In the opinion of the engineer, there should be in reserve not less than 12,000 KW. to allow for normal overhaul of machinery and breakdown of plant. There are at present applications aggregating 27,000 KW., awaiting acceptance, which total would have been bigger had the department been able to deal with new business. The Committee has been advised that the Nechells station should be increased in capacity from the 30,000 KW. now in hand, to 90,000 KW. by the addition of two 15,000-KW. sets. Provisional estimates have been prepared, as follows:—Station buildings, £269,200; engine house equipment, £380,000; boiler house, £603,500; cooling towers, £81,600; switchgear, station transformers and cables, £166,900; sub-station building and equipment, £74,100; 30,000-volt trunk mains, £36,000; and 5,000-volt and low-tension mains, £146,400.

Price Increase.—Owing to the advance in the price of coal, the Electric Supply Committee has revised its rates. Making due allowance for increased output, it finds it necessary to increase the price of low-tension supplies by approximately ½d. to ¼d. per unit, according to the class of supply.

Blackpool.—Year's Working.—During the year ended March 31st last, the Corporation electricity undertaking had a total income of £80,259. Working expenses, £54,913, and £20,077 for the interest and sinking fund, left a profit of £5,269, compared with a deficit last year of £2,727. The capital outlay on the undertaking stands at £273,057, loans and sinking fund, £46,045, loans redeemed, £128,595, net indebtedness, £98,417, reserve fund nil, working balance, £2,835.

Burnley.—Prospective Price Increase.—Owing to the increase in the price of coal, it is anticipated that the cost of electricity for lighting will be ½d. per unit more after the June reading of the meters. The charges for supplies for power and tramway purposes will also be increased.

Castleblaney (Co. Monaghan).—Public Lighting.—The Urban Council has granted permission to the local electric lighting company to erect poles, wires, &c., for the electric lighting of the town.

Clones.—Public Lighting.—The Electric Light Co. has written to the Urban Council denying statements alleging wastage of electricity in public lighting, stating that the lighting was carried out in accordance with the Council's instructions. The opinion was expressed that economy was needed.

Corby.—Public Lighting Scheme.—Subject to the observance of certain conditions, the Northants County Council has decided to offer no objection to a scheme for public lighting by electricity.

Dalkeith.—Unsatisfactory Plant.—A Committee of the Town Council has inspected the power station, and is of the opinion that the plant is in an unsatisfactory condition and requires immediate attention. Several breakdowns have occurred recently, causing a great deal of inconvenience.

Darlington.—Extensions.—Extensions to the electricity undertaking, involving an expenditure of £100,000, have been approved by the Electricity Committee, to meet next winter's prospective demands, and the Finance Committee has been asked to apply for sanction to borrow this sum. The scheme provides for four additional boilers and two 5,000-KW. sets; with one set boilers to be ordered immediately.

Dublin.—Dock Troubles.—Consequent upon the refusal of dockers to handle military stores, the electric cranes and the Port Board's power station were taken over by Royal Engineers. The dock electricians threatened to call out the Corporation electricians, as a protest against the action taken by the military authorities.

East Grinstead.—Power Station Building.—The Urban District Council has decided to purchase premises with a view to adapting them for the proposed electric light works.

Gillingham.—Wages.—Threatened with a strike, the Council has agreed to increase the wages of electrical operatives.

Hamilton.—Electricity Supply.—Subject to a satisfactory report from the consulting engineers, the Town Council has approved of an application by Edmundsons, Ltd., to expand £5,250 on the installation of a 500-KW. rotary converter, &c., and £400 for the laying of a new feeder to Clydesdale Street.

Hatfield.—Mains Extensions Approved.—The Commissioners have informed the District Council that they have informally approved the proposal of the North Metropolitan Electric Power Distribution Co. to lay mains between St. Albans and Hatfield.

Kingstown (Co. Dublin).—Electricity Supply.—The Urban Council has received a letter from the Law Agent stating that an electricity supply might be obtained from the Dublin Corporation or the Dublin United (Electric) Tramways Co. without the erection of a special power station.

Kingston-on-Thames.—Loans.—The Town Council has applied for loans of £6,000 for two new chain-grate stokers, superheaters, and a steel stack with induced-draught plant; and £9,200 for H.T. and L.T. mains and the cost of converting consumers' plant for a three-phase supply.

Lanark.—Electric Light Scheme.—The Town Council has decided that an expert shall be consulted respecting the suggested electric lighting scheme for the town.

Liverpool.—Special Rates.—The Corporation has approved an agreement for the supply of electrical energy for trade purposes to be charged at power rates.

Navan.—Electric Light Scheme.—Mr. L. J. Lawless, consulting electrical engineer, reporting to the Council on a scheme for electric lighting of the town, estimates the cost at £10,750, plus £1,713 working expenses, and revenue at £2,350. The charge to private consumers to be 1s. per unit. The Council has resolved to ask another expert to furnish a separate report.

Perth.—Extensions.—The Town Council is communicating with the Electricity Commissioners with regard to an extension of plant at the power station and the construction of a railway siding.

Price and Supply of Electricity.—In the House of Commons, Mr. W. H. Sugden asked the Minister of Transport if he would say when he hoped to have a definite economical price fixed and increased electrical power at the disposal of industrial undertakings, bearing in mind the fact that the first portion of the cycle of trade activity had now been entered upon, and could assurances be given that some definite portion of the scheme would be operative before the trade activity passed. Mr. Neal (Parliamentary Secretary to the Ministry of Transport) said there would be a fixed economical price, which would be of general application. The fixing of the price or prices would depend on the operations of the new authorities to be set up under the Electricity (Supply) Act of last session. The Electricity Commissioners were engaged on work preliminary to the determination of the new districts, in accordance with the provisions of the Act. It would then be for existing electrical undertakings, local authorities, and others in each district to formulate schemes for submission to the Commissioners embodying improvements in the supply of electricity in such districts. The Commissioners were fully aware of thelimportance of expediting the work of reorganisation under the Act, and had already made substantial progress.—*Manchester Guardian.*

South Shields.—Training Electricians.—A scheme formulated by the Electricity Committee to train boys in the municipal station as electricians was adopted by the Town Council. Trainees will receive no payment for the first six months, but after that time a scale rising from 10s. to £2 per week will be put into force. A proposal for training ex-officers in this work was referred back to the Committee for further report.

Warrington.—Extensions.—Official sanction has been received to the expenditure of £183,000 on extensions to the electricity works.

Wrexham.—Extensions.—Application has been made by the Town Council for sanction to borrow £17.000 for the extension of the electricity undertaking. It is intended to provide a new boiler, complete with stoker, coal bunkers, foundations, pumps, &c., at a cost of £11,350; economisers, flues, &c., £2,230; buildings, £2,000; and water-softener, £1,260.

Digitized by Google

Wigton.—Electricity Supply.—The Urban District Council has asked the Carlisle Town Council the price at which electricity can be supplied to the district.

York.—Time Extension.—The Minister of Transport has extended the time of the York Electric Lighting (Extension) Order, 1914, until April 30th, 1921, for the extension of mains, &c.

TRAMWAY AND RAILWAY NOTES.

Australia.—Wage Demand.—Railway and tramway men in Victoria and New South Wales are demanding double wages during the visit of the Prince of Wales.—*The Times.*

Blackpool.—Year's Working.—The Corporation tramways made a profit during the financialyear ended March 31st last, of £15,583, compared with £30,052 the preceding year. The receipts were £186,475, as against £140,929, but the working expenses totalled £147,770, compared with £90,033 for the previous period.

Bradford.—Proposed Fare Increase.—At a special meeting of the Tramways Committee last week, Mr. R. H. Wilkinson, the manager of the department, presented a report concerning the proposal to increase the fares. Additional information is, however, required as to whether a scheme of short stages for a penny and at the same time increasing the 1½d. fare to 2d. is not practicable, and the question is to be further discussed.

Brazil.—Railway Electrification.—The contract for the electrification of the Paulista Railway Co.'s line between Jundiaby and Campinas, has been secured by the International General Electric Co. The total cost is estimated at $2,000,000, the line being 28 miles in length, double track. The rolling stock is to consist of 12 geared type 3,000-volt D.C. locomotives, four passenger and eight freight engines. The power will be supplied by the Sao Paulo Light and Power Co. at 88,000 volts, 60 cycles. Extension of electrification as far as San Carlos is contemplated, which will make a total length of 128 miles.

Continental.—Italy.—It has been decided to extend the electrification of certain lines in the north-west, especially in Liguria, Piedmont, and Lombardy. The three-phase system is used on the lines already electrified in this region. The following are the sections which the Railway Administration has been authorised to electrify:—Turin-Alexandria-Rouco, 137 km.; Voghera-Novi, 35 km.; Alexandria-Tortona, 22 km.; Asti-Ovada-Sampierdurena, 101 km.; Trofarello-Fossano-Mondovi-Ceva, 80 km.; Bussoleno-Turin, 45 km.; total, 420 km. A sum of 280 million lire has been earmarked for the work, which will be crrried out by the State Railway Department. A further 209 km., comprising Turin-Milan and Milan-Voghera will be electrified. This part of the work is being put to tender by private industry. The cost will be some 60 million lire.—*L'Industria.*

Doncaster.—Inadequate Service.—Some very caustic comments were made at the last meeting of the Bentley District Council anent the dilatory manner in which the village was being served with tramways. The track is partly up, owing to repairs, and only one car has been running for the past three weeks. The Council decided to lodge a complaint with the Ministry of Transport.

Liverpool Electric Signalling.—On the Mersey Electric Railway it is intended to introduce new automatic signalling, so as to concentrate a larger volume of traffic in the busy hours of the day. The system will be similar to that in use on the underground railways in London. The contract for the work has been placed, and it is expected that the new installation, which will be of the most modern type, will be completed by October next in time for the heavy winter traffic, which usually commences about that time. The power for operating the apparatus will be supplied by special sets installed at the power stations, and will be independent of the main supply for operating the trains.

Huddersfield.—Coal Haulage.—It was reported at a recent Council meeting that £1,687 had been received for the haulage of coal along the tramlines to mills at Lindley and Outlane. The loss of revenue in consequence of the recent strike of tramway employés was £7,536.

India.—Tramway Reconstruction.—The Bombay Electric Supply and Tramways Co. has approved a scheme for the reconstruction of the company, and it has been resolved to raise the capital from £1,430,000 to £1,680,000.—*Engineer.*

Johannesburg.—Overhanging Trees.—Unusual circumstances attended the payment by Johannesburg Town Council of £2,000 to a man who lost the sight of an eye owing to an accident while a passenger on a tramway car. The mishap was due to a tree brushing against the top deck and striking him as he sat in his seat. The Tramways Committee reported that it had been advised that the other eye was affected, and on an examination being made, its medical officer reported that the sight of the other eye was limited to five-ninths of the normal. The claim originally was for £4,500, but the passenger's solicitor offered to settle, without prejudice, for the sum already mentioned. That amount was voted "in full and final settlement of the claim." The case is not without interest for other tramway and also omnibus undertakings. It is the duty of owners of trees to keep them from becoming a danger to traffic. In case of neglect the local authority can demand a removal of the obstruction, and, if necessary, carry out the operation. Such action has been taken in the metropolitan district and elsewhere at the request of the London General Omnibus Co. There have been occasions when in cases of delay the company's employés have been seen undertaking the task, the men working from the top of an omnibus. In the case of lamp-posts situated too near the edge of the kerb, disputes have arisen between a local authority and the company. While the former has attributed collisions to the overhanging of the top deck, the company has complained that the road has too pronounced a camber. This is a matter that ought to come under the cognisance of the Minister of Transport, at least on main thoroughfares.—*Tramway and Railway World.*

Leeds.—Reserve Fund.—The Tramways Committee recommends that in future any surplus receipts from that department shall be paid into the tramway reserve fund, authorised by the Act of 1905, and that the fund shall accumulate till £100,000 is reached. Previously the reserve fund was fixed at £25,000. In 1919 the department relieved the rates to the extent of £90,000. Last year's working showed a net surplus of £83,757.

Proposed Fare Increase.—The proposal to increase the tramway fares to 1d. a mile is to be again brought before the full Council for discussion, despite the fact that a similar proposal was negatived by the Council about six weeks ago. It is stated on the authority of the chairman of the Tramways Committee (Alderman R. A. Smithson) that the department is losing £300 a day on the present fares.

Llanelly.—Strike Ended.—The tramway workers have resumed work, after being on strike for three weeks.

London.—Higher Fares.—At a recent meeting of the L.C.C., the chairman of the Highways Committee foreshadowed further increases in fares in the near future. A proposal to reserve cars for women only was not considered desirable.

Oxford.—Strike.—The employés of the Oxford Electric Tramway Co. (which runs an omnibus service in the neighbourhood) came out on strike for higher wages on May 19th, and no vehicles were running. The city is very full of visitors, and the stoppage caused great inconvenience.—*The Times.*

TELEGRAPH AND TELEPHONE NOTES.

Argentina.—New Wireless Stations.—According to the *Review of the River Plate*, the wireless stations are inadequate for a general public service as they are practically constantly occupied in the transmission of official dispatches. They are, therefore, to be augmented, and the wireless telegraph division and the Ministry of Marine has formulated a plan which has been approved by the Government, and a naval officer is to come to England to make the necessary acquisitions. The project comprises the erection of three stations at the Patagonian ports of Gayman, Rawson, and Puerto Gallegos, in addition to one at Buenos Aires. These stations will be capable of transmitting over a distance of 2,000 km. under all conditions. It is intended later to supplement them with four other stations of 800-km. capacity situated at Corrientes, Puerto Militar, Comodoro Rivadavia, and Ushuaia.

Cable Repairs.—The work of repairing the Stornoway, Castlebay, and Skye cables is being carried out quickly. The services of the Lochboisdale and Tobermory wireless stations are no longer necessary, and the repairs to the Stornoway and Poolewe cables would have been completed had the weather remained favourable.

Canada.—Telegraph Rates.—According to the *Times*, a ruling of the Railway Commission permits the increase of rates on telegrams in Eastern Canada by 32 per cent., and in Western Canada by 20 per cent. This ruling does not, however, apply to Press messages.

United States.—Wireless Telephony.—The *Telephone Engineer* announces that tests in the U.S.A. have proved that it is possible to communicate by wireless telephony over a distance of 1,500 miles, using a generator having a capacity of only ½ KW. The De Forest Radio Co., of New York, enlisted the aid of members of the American Radio Relay League in its experiments. Tests, which commenced in February last, were carried out nightly with many members of the League listening in, and Mr. R. F. Gowan, engineer to the De Forest Co., at the New York end, and Mr. R. H. G. Matthews, vice-president of the League, at the receiving station at Chicago. Eventually communication was established between the two cities, a distance of 750 miles, with the power mentioned above. Later, letters were received from observers at Topeka, Kas., 1,500 miles away; Valley City, N.D.; Battle Creek, Mich.; and Gaffney, S.C., announcing that they also had heard the conversation.

The U.S.A. Department of the Interior has equipped its rangers in the forests of the West with small wireless telephone sets having a small range to facilitate communication.

CONTRACTS OPEN AND CLOSED.

(The date given in parentheses at the end of the paragraph indicates the issue of the Electrical Review *in which the "Official Notice" appeared.)*

OPEN.

Australia.—Melbourne.—May 31st. Victorian Railways Department. Four 4,500-kw., 1,500-volt traction converter sets, and eight 1,000-kw., 1,500-volt ditto. (April 30th.)

Sydney.—August 4th. N.S.W. Government Railways and Tramways. Two 1,000-kw. sub-station units. Chief Electrical Engineer, 61, Hunter Street, Sydney.

August 3rd. Department of Public Works. Turbines and generators for the Barren Jack hydro-electric development scheme. Department of Public Works, Sydney.

July 18th. City Council. Maximum demand indicators. Electric Lighting Department, Town Hall, Sydney.

Perth.—July 14th. P.M.G.'s Department. Telegraph and telephone instruments (various parts). Schedule 674.

June 16th. P.M.G.'s Department. Telegraph and telephone instruments (various parts). Schedule 680. (May 14th.)

Adelaide.—June 23rd. P.M.G.'s Department. Telephone parts (schedule 541). (May 21st.)

Barnes.—June 7th. Urban District Council Electricity Department. Coal-handling plant and overhead steel or ferro-concrete bunkers. (May 14th.)

Belgium.—June 2nd. La Société Nationale de Chemins de Fer Vicinaux, 48, Rue Montoyer, Brussels. Installation of the overhead electric equipment of the Namur La Citadelle line and branches. Particulars from the department of the Services Electriques at the above address.

July 9th. Brussels Municipal Authorities. A turbo-alternator at the generating station on the Quai des Usines, Laeken. Specification 2 francs and drawings 1½ francs, from the Hotel de Ville, 15, Rue des Augustins, Brussels.

Carlisle.—June 25th. Electricity Department. One 3,000-kw. turbo-alternator and condensing plant. (See this issue.)

Dublin.—June 7th. Electricity Supply Committee. 12 months' supply of single-phase and three-phase meters.

June 1st. Electricity Supply Committee. 22 direct-current magazine flame arc lamps. (May 21st.)

June 10th. Electricity Supply Committee. Feed pump, tanks, pipework, &c., for Pigeon House generating station. (See this issue.)

Dundalk.—June 15th. Urban District Council. Electricity Department. 750 yd., L.T., 3-core, paper-insulated, lead-covered and armoured cable; disconnecting boxes (pavement type) and joint boxes. (See this issue.)

Edinburgh.—June 19th. Electricity Supply Department. E.H.T. and L.T. switchgear, &c., for Portobello station. (May 21st.)

Grimsby.—June 7th. Electricity Department. E.H.T. cables and pilot cables (specification No. 146). (See this issue.)

Ince-in-Makerfield.—June 15th. Urban District Council. Waterworks Department. Motor-driven pumping sets; cables; alterations to winding engine from steam to electric drive; switchgear. (See this issue.)

Leeds.—June 14th. Electricity Department. 12,000-kw. steam turbine, alternator and condensing plant. (May 14th.)

London.—Hackney.—June 9th. Electricity Department. Four water-tube boilers, each 33,000 lb. per hour capacity, with superheaters, mechanical stokers, &c.; four induced-draught plants; four fuel economisers; one 10,000-kw. turbo-alternator and exciter, with ventilating fan and air filter or cooler; one surface condensing plant; two circulating water motor-driven pumps; E.H.T. switchgear; two 20,000-kw. coupler panels; one 10,000-kw. generator panel; six 2,000-kw. and one 4,000-kw. feeder panels. (May 7th.)

Bethnal Green.—June 7th. Electricity Supply Department. Two 500-k.v.a. transformers; one E.H.T. and one L.T. panel; L.T. feeder cables; section pillars and road work. (May 21st.)

St. Pancras.—June 10th. Electricity Department. 45,000 tons steam coal for the Regent's Park and King's Road electricity stations. Electricity Department, 57, Pratt Street, Camden Town, N.W.

Wimbledon.—June 12th. Electric Lighting Committee. Two boilers, with mechanical stokers, induced-draught fan and motor, pipework, steel chimney, &c. (See this issue.)

Manchester.—June 7th. Electricity Department. Main and auxiliary switchgear; Section A, 33,000-volt and 6,000-volt main switchgear; Section B, pressure-testing switchgear; Section C, 420-volt A.C. auxiliary switchgear; Section D, 240-volt D.C. auxiliary switchgear. (April 30th.)

Auckland.—September 1st. Harbour Board. For the supply of electric capstans and spares. Messrs. W. & A. McArthur, Ltd. 18-19, Silk Street, Cripplegate, London, E.C. 2.

Salford.—June 5th. Electricity Department. 12 months' supply of D.C. and A.C. meters. (May 21st.)

Southampton.—June 14th. Electricity Department. E.H.T. and H.T. switchgear and D.C. control panel. (See this issue.)

Spain.—June 2nd. Gijon-Musel Harbour authorities. Three 3-ton electric cranes. Tenders to the Junta de Obras del Puerto de Gijon-Musel.

Warrington.—June 15th. Electricity and Tramways Committee. Motors and transformers. (See this issue.)

CLOSED.

Government Contracts.—The following Government contracts were placed during April, 1920:—

Admiralty (Contract and Purchase Department).

Conduit tubing and accessories.—Barton & Sons, Ltd.; Oriental Tube Co., Ltd.
Electrical plant.—British Thomson-Houston Co., Ltd.
Electric lighting.—Foote & Milne, Ltd.
Reconstruction of motor-generators, &c.—British Electric Plant Co., Ltd.
Turbo-generator armature.—Metropolitan-Vickers Electrical Co., Ltd.

Ministry of Munitions.

Armoured cable.—Siemens Bros. & Co., Ltd.

India Office: Stores Department.

Accumulator battery.—Chloride Electrical Storage Co., Ltd.
Cells.—Siemens Bros. & Co., Ltd.
Creed printers.—Creed & Co., Ltd.
Insulator cups.—Bullers, Ltd.
Generating sets.—Lancashire Dynamo & Motor Co.
Insulators.—Bullers, Ltd.
X-ray plates.—Kodak, Ltd.
Insulator stalks.—Bullers, Ltd.
Switchboard.—Bertram Thomas, Ltd.
Desk telephone sets.—Peel-Conner Telephone Works, Ltd.
Coolidge tubes.—British Thomson-Houston Co., Ltd.

Post Office.

Laying conduits.—London-York (Sections 1 and 2): W. Dobson; Nottingham-Derby (Sections 2 and 3): W. Dobson; Glasgow (South): A. Duncan; Newcastle-on-Tyne (Sections 1, 2, 4 and 6): W. Turner (Ardwick), Ltd.; Leeds-Harrogate, Leeds-York (Section 1): W. Ellis. London-Bristol-Newport (South Midland, Section 2): J. F. Hodge & Co.; Nottingham-Derby (Section 1): Kettle & Son; London-Southampton (Section 2): Hodge Bros. (Contractors), Ltd.; Lee (High Road): J. Mowlem & Co., Ltd.; Toll Exchange area: J. Mowlem & Co., Ltd.; Penge-Anerley: W. H. Wheeler & Co., Ltd.; Brompton Road, S.W.: O. C. Summers; Nottingham-Derby (Section 4): Chandler Bros.
Manufacture, supply, drawing-in and jointing cable.—London-Southampton (London-Guildford section): Callender's Cable & Construction Co., Ltd.
Repairing battery, East London Telephone Exchange: Hart Accumulator Co., Ltd.
Runaway, ash hoist, overhead travelling crane and geared trolley.—Mount Pleasant E.C. Boiler House and Sub-station: H. Morris, Ltd.
Telephone exchange equipment.—Port Talbot, New Cross, Bradford (central), Crosby, Trafford Park: Western Electric Co., Ltd.; Northwich: Automatic Telephone Manufacturing Co., Ltd.
Sub-contractors for batteries.—Chloride Electrical Storage Co., Ltd.
Starting switch and field rheostat.—Crompton & Co.
Switches, D.P., and measuring instruments.—Park Royal Engineering Co., Ltd.
Fuse switch.—Berry's Electric Co.
Charging rheostat.—Geipel & Co.
Circuit-breaker.—Whipp & Bourne.
Scarborough Telephone Exchange equipment.—Siemens Bros. & Co., Ltd.
Sub-contractors for accumulators.—Tudor Accumulator Co., Ltd.
Charging machine.—English Electric Co., Ltd.
Ringing machine.—Crompton & Co., Ltd.
Knife and meter switches, starting switches, field regulator (switchgear on power board).—English Electric Co., Ltd.
Indicating meters.—Everett, Edgcumbe & Co., Ltd.
Circuit-breaker for generator.—I.T.E. Electric Co.
Fuse switch (switchgear on power board).—Berry's Electric Co.
Protective apparatus.—Siemens Bros. & Co., Ltd.; International Electric Co., Ltd.
Telegraph apparatus.—W. Sanders & Co.
Telephone apparatus.—British L.M. Ericsson Manufacturing Co., Ltd.; International Electric Co., Ltd.; Peel-Conner Telephone Works, Ltd.; Phœnix Telephone and Electric Works, Ltd.; Siemens Bros. & Co., Ltd.
Terminal blocks.—Edison Swan Electric Co., Ltd.
Bolts for insulator spindles.—Horton & Son; Portland Bolt and Nut Co., Ltd.
Iron brackets.—D. Willetts, Ltd.
Telegraph and telephone cable.—British I. & H. Cables, Ltd.; Enfield Ediswan Cable Works, Ltd.; Fuller's United Electric Works, Ltd.; Hackbridge Cable Co., Ltd.; Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Union Cable Co., Ltd.
Artificial cables.—H. W. Sullivan.
Dry cells.—Siemens Bros. & Co., Ltd.
Leclanche cells.—Siemens Bros. & Co., Ltd.
Secondary cells.—Van Raden & Co., Ltd.
Joint box channels.—Bailey Pegg & Co., Ltd.; Falkirk Iron Co., Ltd.; McDowall, Steven & Co., Ltd.
Stoneware ducts.—Donington Sanitary Pipe and Firebrick Co., Ltd.; G. Jennings; Robinson & Dowler, Ltd.; Stanley Bros., Ltd.; J. H. Turner & Lesney, Ltd.
Stoneware Leclanche jars.—J. Bourne & Sons, Ltd.
Glow lamps.—British Thomson-Houston Co., Ltd.; Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.; Siemens Bros. Dynamo Works, Ltd.
Earth plates.—Walls, Ltd.
Insulator spindles.—T. W. Leach, Ltd.; Bayliss, Jones & Bayliss, Ltd.
Swivel stays.—Bullers, Ltd.
Voltoids.—Brunner, Mond & Co., Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.
Enamelled, &c., copper wire.—London Electric Wire Co. & Smiths, Ltd.
H.D. copper wire.—T. Bolton & Sons, Ltd.; British I. & H. Cables, Ltd.; Elliott's Metal Works, Ltd.; R. Johnson & Nephew, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.); J. Wilkes, Son & Mapplebeck, Ltd.
Tinned copper wire.—T. Bolton & Sons, Ltd.
Switchboard wire.—Macintosh Cable Co., Ltd.

H.M. Office of Works.

Engineering work, &c.—Birmingham Hostels electric storage battery: Premier Accumulator Co., Ltd.; Hampstead Research Institute switchboard: Drake & Gorham, Ltd.

Crown Agents for the Colonies.

Aerial cable.—Callender's Cable & Construction Co., Ltd.
Copper cable conductors.—Siemens Bros. & Co., Ltd.
Electrical fittings.—General Electric Co., Ltd.
Telegraph ironwork and line material.—Siemens Bros. & Co., Ltd.

Digitized by Google

Shrewsbury.—
Two new economisers for the generating station, £1,155.—Messrs. Lowcock.

Southend-on-Sea.—Town Council :—
24 40-H.P. traction motors, £6,720; and 12 electric brakes and equipment, £1,800.—English Electric Co., Ltd.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, May 28th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette on "Two Years as an Engineer in the Grand Fleet," by Mr. A. Arnold.

(South-Western Local Section).—Friday, May 28th. At the Public Library, Plymouth. At 7.30 p.m. Inaugural meeting.

Royal Society of Arts.—Friday, May 28th. At John Street, Adelphi, W.C. At 4.30 p.m. Paper on "Lignite," by Prof. W. A. Bone, F.R.S.

Friday, June 4th. At John Street, Adelphi, W.C. At 4.30 p.m. Paper on "The Oil Resources of the British Empire," by Prof. Sir J. Cadman.

Electrical Power Engineers' Association (Southern Division, London Industrial Section).—Friday, May 28th. At Anderton's Hotel, Fleet Street. At 7.30 p.m. Open meeting.

Physical Society of London.—Friday, May 28th. At the Imperial College of Science, South Kensington. At 5 p.m. Discussion on "X-Ray Spectra," to be opened by the President, Sir W. H. Bragg, F.R.S.

Royal Institution of Great Britain.—Saturday, May 29th. At Albemarle Street, W. At 3 p.m. Tyndall lecture on "Recent Revolutions in Physical Science: (1) the Theory of Relativity," by Prof. J. H. Jeans, F.R.S.

North of England Institute of Mining and Mechanical Engineers.—Saturday, May 29th. At the Wood Memorial Hall, Newcastle-on-Tyne. At 2 p.m. General meeting.

Chief Technical Assistants' Association.—Thursday, June 3rd. At Anderton's Hotel, Fleet Street, E.C. At 7 p.m. Paper on "Maintenance of Tramway Equipment," by Messrs. Manley & Stanley.

NOTES.

Parliamentary.—On May 17th the Tramways (Temporary Increase of Charges) Bill was read a third time and was passed.

Electric Vehicle Charging Garages.—We are informed by the chairman and hon. secretary of the Electric Vehicle Committee, Mr. Frank Ayton, that the Electricity Commissioners are prepared to consider applications from local authorities, being authorised undertakers, for sanction to loans for the purpose of providing public electric vehicle-charging garages and the equipment thereof. Provisional sanction has already been given to the borrowing by the Ipswich Corporation of the sum of £4,000 for this purpose.

Brevities.—Work varies inversely as the square of the talk.

The torque of a rotor gets things done; the rot of some talkers doesn't.

If you want to lose your good name, have it stamped on your two-foot rule.

He that will not be ruled by the rudder will be wrecked by the rocks.

There are no half measures about automatic plants; they are either automatic or autoblazes.

Increase of resistance means decrease of current. Some fellows go through life as if this were the last word. What's the matter with increasing the pressure and getting a move on?—"BEOLA," in the *Journal*, N.A.S.E.

The Nobel Prizes.—The distribution of the 1918 and 1919 Nobel prizes will take place in Stockholm on June 1st. Among those who will be present are Prof. Sir W. H. Bragg and his son, Prof. W. J. Bragg, and Prof. Charles G. Barkla, of Edinburgh.

Inquiry.—Makers of the "Hough" watertight ship fitting are asked for.

The Electricity Supply Amending Bill.—According to *The Times* the Electrical and Allied Trades' Section of the London Chamber of Commerce has passed a resolution expressing alarm and regret at the introduction of the Bill for the purpose of reviving the "objectionable clauses" which were dropped from the Electricity (Supply) Act of 1919, largely at the instance of associations (including that chamber) representative of consumers and producers alike.

The Metric System in U.S.A.—In the May issue of the *Journal* of the American Society of Mechanical Engineers, a resolution of the Council is recorded, stating, in view of the publication of articles to the effect that the Society is opposed to the metric system, that the Society has not taken any stand either for or against the metric system. This declaration is important, seeing that the Society has repeatedly been represented as the leading opponent to the adoption of the metric system in the United States.

Oil-Electric Locomotives.—According to *The Times*, oil-electric locomotives have been tried on the French Nord Railway with great success, and it is now proposed to make a more general use of such engines owing to their practicability in case of strikes.

Educational.—Prince Arthur of Connaught has received two important donations to the University College Engineering Fund from America, namely, £500 from Mr. J. Pierpont Morgan, and £500 from Mr. E. R. Stettinius. Other donations received recently include Igranic Electric Co., Ltd, £50; and a promise of apparatus to the value of £50 from Messrs. Nalder Bros. & Thompson, Ltd. The total of the fund up to date amounts to £32,375.

At a recent conference of technical teachers, it was resolved to press for the formation of a Burnham Committee to deal with salaries of teachers in technical institutions. An immediate increase is being asked for, to bring salaries up to the level which would have been reached if the Civil Service bonuses had been awarded.

Legal.—CORK.—At the Fermoy (Co. Cork) Quarter Sessions on June 7th, the Recorder of Cork will have before him for hearing the claim of the Postmaster-General for £230 compensation for the cutting of many telegraph and telephone wires in several parts of East Cork on Saturday night, May 8th.

Judgment was given by Sheriff Substitute Macleod at the Sheriff Court, Edinburgh, in the case in which James Cameron, electrician, 37, Saughton Hall Drive, Edinburgh, was charged with having, between February 11th and 23rd last, resetted in his premises at Haymarket Terrace, three electric motor engines. Evidence had been heard last week. His Lordship, in finding the charge proved, said that accused had yielded to temptation under very special circumstances. It was thus an exceptional case, and therefore he dealt with it by imposing a fine instead of a term of imprisonment. But the fine must be a substantial one of £25.

Turbine Steam Consumption.—In discussing Mr. W. T. Lane's recent paper on "Fuel Economy in Power Production [or Utilisation of Waste Heat]" before the South Wales Institute of Engineers, Prof. F. Bacon said that the figures which the author gave of a turbine of 5,000 KW. capacity, with a guaranteed steam consumption of 10·2 lb. per KW.-hour, were very interesting, and persumably they were based on a turbine which was on order for the Powell Duffryn Co. This showed that South Wales was to possess about the most economical steam turbine yet produced. Particulars had been recently published of the super-power station at Rotherham, and they learned of a Parsons turbine there of more than double the size of that mentioned by Mr. Lane, namely, of 12 500-KW. capacity, with a guaranteed steam consumption of 11·5 lb. per KW.-hour. Then there was a 30,000-KW. turbo-generator being erected at the same station, with a guaranteed steam consumption of 11·1 lb. per KW.-hour. Thus, in South Wales they had a turbine only one-sixth the size with a consumption of 1 lb. less of steam per KW.-hour. No doubt the explanation was that in this case they were making use of exceptional steam pressures and exceptional super-heat—he imagined not less than 350 lb. per sq. in., and temperatures running up to 750° F., which must be getting near the limit of what could be attained with steel castings and steam valves such as were now available.

The Electrical Trades Benevolent Institution.—The report of the committee and accounts for the year 1919 have come to hand; the volume includes the report of the annual general meeting, 1919, and the festival held on November 12th, 1919, as well as a list of governors, members, subscribers and donors, and the rules. The report and accounts for the year were presented at the annual general meeting, of which we gave a report on p. 532 of our issue of April 30th, 1920. A special meeting will be held on June 7th at 2.30 p.m., at the secretary's office, 36-38, Kingsway, to confirm a resolution altering Rule 17 which was passed at the annual meeting.

Appointments Vacant.—Technical assistant (£804) for the London County Council Fire Brigade Department; meter repairer (mechanician) (45s. + 33s. 6d. + 12½ per cent.) for the Borough of Lancaster Electricity Department; lecturer in electrotechnics (£390—£465) for the Salt River Technical Institute, Cape Town; temporary technical assistant for the Chesterfield Corporation Electricity and Tramways Department; charge engineer (£3 + E.P.E.A. award) for the Southwark Borough Council Electricity Department; power-station engineer (£300 + £120 + 20 per cent.) for the Woolwich Borough Council Electricity Department; plumber-jointer (91s.) for the Rhyl U.D.C. Electricity Department. See our advertising pages to-day.

A general manager and engineer is required for the Tees-side Railless Traction Board at Middlesbrough (£500).

New Method of Erecting Poles.—An interesting method of erecting poles by means of a combination tractor and earth-boring machine, which digs a hole and sets the pole in about eight minutes, is mentioned in the *Telephone Engineer*. The earth-boring machine is mounted on the frame of the tractor, which carries it over any obstacles that may be encountered in an ordinary day's travel. The poles, cross arms and insulators, &c., are all assembled beforehand, and when the spot at which the pole to be erected is reached, the power from the Monarch tractor engine is switched to the earth-boring machine. This, in reality, is a giant auger which will bore a hole in the ground any size from 2 to 30 in. in diameter, and as deep as 8 ft. When the hole is bored, the steel tower in which the auger is contained is used as a crane to lift the pole and set it in position. The whole operation is remarkably expeditious, and when once it is seen at work, the manual process ordinarily used seems incredibly slow and awkward.

Digitized by Google

The Educational Kinema.—The Dean of Worcester, speaking at a lecture, said that he considered the kinema of the greatest educational value, and he was in negotiation with the lessee of a leading kinema in Worcester to take it over for a week, when he intended to have children's days, and exhibitions which would elevate and educate adults.

Municipalisation.—Although the methods of municipalities on this side of the Atlantic are often severely criticised, it is, perhaps, comforting to reflect that public opinion on this subject

THE INFLUENCE OF THE ART OF MILLET ON THE MODERN MUNICIPAL STREET GANG.

in the United States of America, justly or otherwise, is much stronger, as the picture reproduced above will testify. This is taken from the National Electric Light Association *Bulletin*, which reproduced it from the well-known *New York Tribune*.

Alumina as a Refractory.—In *Technique Moderne* (Vol. 12, No. 3) a note on the use of products of aluminium as refractory materials is printed. While these products are not suitable for large furnaces, they serve admirably for laboratory furnaces, provided that they are prepared by the process indicated in the note, for temperatures up to 1,600° C.

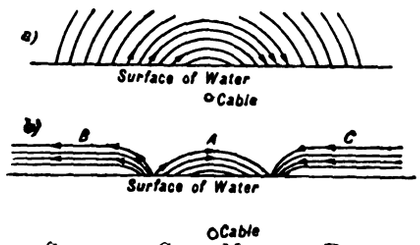
The New Motor Taxes.—The petrol world is greatly exercised over the change from a petrol tax to a vehicle tax based on horse-power or weight. The special committee appointed by the Minister of Transport to report on the matter decided to bring in all power-propelled vehicles, on a basis which would afford an approximation to the distinctive use of the road. Motor cycles are to be assessed according to category, private motor cars on horse-power, hackney vehicles on seating capacity, and commercial and agricultural vehicles on unladen weight. The new scale will not come into force until January 1st, 1921. Some editorial reflections on the matter in the current issue of the *Electric Vehicle* will not be out of place; they are:—

"So far as electric vehicles are concerned, there is little ground for complaint. The committee has, we imagine, not overlooked the fact that battery-propelled vehicles, thanks to their easy running and smooth speed control, are much less severe on road surfaces than other vehicles equivalent in weight and average speed. On this and other grounds the weight of the accumulators is to be excluded from the vehicles in ascertaining the unladen weight of commercial vehicles.

"The minimum tax for private cars is £6, and electrically-propelled cars of this class pay only this amount. Electrically or mechanically-propelled bath-chairs or other vehicles for invalids, not exceeding 5 cwt. in weight inclusive, pay five shillings. In this case the batteries are included. For commercial goods vehicles the rate proposed is from £10 for vehicles not exceeding 12 cwt. unladen weight up to £30 for vehicles over 4 tons unladen weight. Hackney vehicles (other than tramcars, which are to be chargeable as hackney carriages as at present) are to pay according to seating capacity from £15 for a vehicle with a seating capacity from one to five passengers to £84 for a vehicle with a seating capacity of over 32.

"On motor scooters and other motor assisted cycles and motor cycles, up to and including 200 lb. in weight, the tax is thirty shillings, and above that limit it is £3, with an extra £1 on all motor cycles with the right to draw a trailer or side car. These taxes seem rather heavy. A tax of 30s. on a scooter propelled by batteries is manifestly onerous, and a similar observation may be made in the case of a light car propelled electrically. If it is a three-wheeler, it will pay £4; if it is a four-wheeler, it will pay £6, no matter how trifling its efficiency as a destroyer of roads. The application of battery traction to scooters and other small vehicles is as yet in an experimental condition, but when development does occur there ought to be some concession to the electric method, on account of its reduced wear and tear on the roads. The low rating of motor bath-chairs and other vehicles for invalids is welcome, but it rather throws into relief the fact that an electric chair, similar to those used at American exhibitions, would be taxed at the rate of £4 a year, as if it were a high-speed vehicle instead of a handy means of progression at a walking pace. And when some bright genius uses a small battery to push along a perambulator he will pay handsomely for the privilege. Another form of electric traction which the committee has overlooked is the industrial truck. The great majority of industrial trucks are used on private ground—in factories, railway stations, docks, and so on—but in a few cases, notably that of the B.S.A. works in Birmingham, they traverse the public streets on their way to and from various departments. In the latter instance they bear the usual identification plates, and are otherwise regulated as motor vehicles, but it would be absurd to class them, for taxation on behalf of road wear, on the same basis as the ordinary commercial vehicle. One has only to look down the classified list of vehicles in the committee's report to realise that nobody contemplated the possibility of factory trucks using the highway occasionally in the execution of their duty. Presumably they would come under the classification of "commercial goods vehicles," and would pay a minimum of £12—£10 for the truck itself and £2 extra for the right to draw a trailer. This is a preposterous tax for a means of factory transport which involves only a trifling use of the road, and is of a totally different character from the ordinary commercial vehicle. The simplest way out of the difficulty is to exempt electric industrial trucks from taxation or to impose a merely nominal rate. We may note that locomotive ploughing engines, agricultural tractors not exceeding 5 tons unladen weight, or other agricultural engines drawing necessary gear, threshing appliances, farming implements, or supplies of fuel or water shall pay a duty of 5s. per annum only, if not used on roads for other haulage work. The addition of electric industrial trucks to this category would remove the anomaly into which the committee has fallen."

Submarine Cable Magnetic Fields.—Some experiments described in *E.T.Z.* were carried out in 1918 by the Under Water Signalling Section of the Kiel Torpedo Inspection Department, and consisted in an investigation of the magnetic field in the neighbourhood of the surface of the water covering a cable carrying alternating currents of frequencies of 50, 500, and 1,000 cycles. The current was fed in at one end by the generator and out at the other end through an earth connection, and was usually 2 amps. The field was explored by observers in boats equipped with search coils connected to amplifiers and telephones, and in the case of 50-cycle experiments the oscillations were rendered audible by a method that is not disclosed. At 50 cycles the field above the cable was of the distribution shown at (*a*) below, and just as one would expect, but at 500 and 1,000 cycles the lines of force took the form of (*b*) of the figure. It will be seen that the lines A represent the circular field due to the current in the cable, and the lines in the zones B and C are produced by eddy currents induced in the water. The double change of



SUBMARINE CABLE MAGNETIC FIELDS.

direction of the field at the junctions of the zones A and B and A and C was corroborated by various tests. If iron ships are used, it is found that the lines of force follow the direction of the sides of the ship and run at right angles to the axis of the ship—that is to say, the ship becomes a conductor of the current, which is absorbs from the water. The intensity of the field decreases inversely as the square of the distance from the cable. Proceeding along the cable from the end that is fed by the generator, both the current and the magnetic field decreased according to an exponential law. The effect of the depth of water was ascertained by laying the cable so that it gradually increased in depth from 10 m. to 100 m. in a length of 60 km. At 500 cycles the field at the surface of the water decreased to the 1/1.42nd part for each 10 m. increase in depth. At 1,000 cycles the corresponding fraction was 1/1.51. This exponential decrease points to the formation of eddy currents in the water. The electric field was examined by immersing two electrodes in the water and connecting them to a search coil electromagnetically coupled to the acoustical receiving apparatus. Only few tests were made, but it was found that the electric field decreased inversely as the square of the distance from the cable.

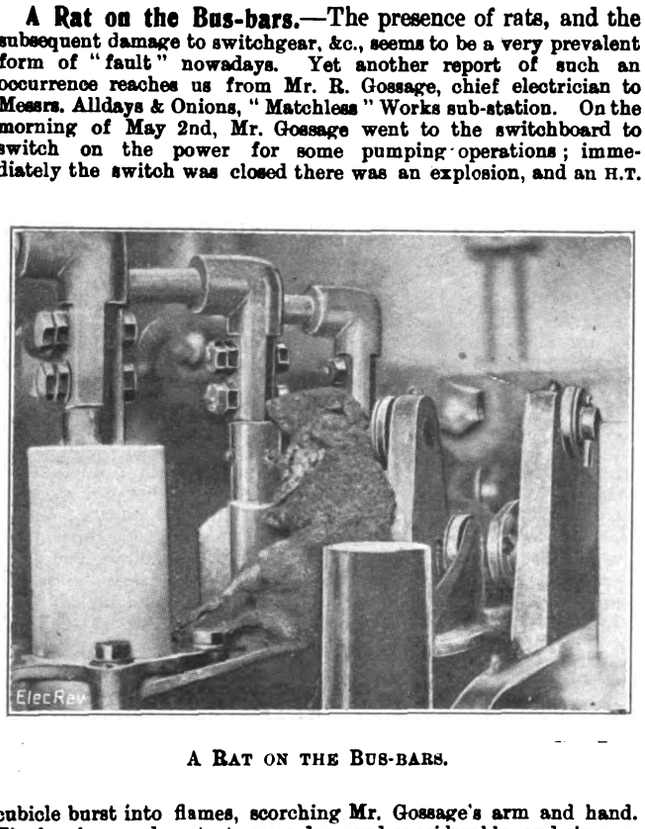
The Optophone.—Some years ago we described an instrument for enabling the blind to read ordinary print, called the "optophone." At the time the idea was considered good, but rather impracticable for ordinary purposes, and it is with great admiration for the work of Dr. E. E. Fournier d'Albe, Mr. W. Forster Brown, and Messrs. Barr & Stroud, Ltd., of Glasgow, that we read of the success attained by recent developments of the apparatus. The latest form is described in detail in a recent issue of *Nature*, and the writer, Dr. Fournier d'Albe, considers that "the problem of opening the world's literature to the blind is now definitely solved."

A Rat on the Bus-bars.—The presence of rats, and the subsequent damage to switchgear, &c., seems to be a very prevalent form of "fault" nowadays. Yet another report of such an occurrence reaches us from Mr. R. Gossage, chief electrician to Messrs. Alldays & Onions, "Matchless" Works sub-station. On the morning of May 2nd, Mr. Gossage went to the switchboard to switch on the power for some pumping operations; immediately the switch was closed there was an explosion, and an H.T.



A Rat on the Bus-bars.

cubicle burst into flames, scorching Mr. Gossage's arm and hand. The bus-bars and contacts were damaged considerably, and six H.T. insulators were smashed. Upon subsequent investigation, it was discovered that a large rat had got across the bars, as the accompanying photograph shows—with fatal results to itself, of course. It seems as though a rat-trap will soon have to be a recognised item in power-station equipment, as the present method of destroying rats is far too costly.

Fraternity.—By "Ruddigore." A little poem dedicated to the Corporation of York, which recently advertised for a jointer at a wage of £4 7s. 6d. per week, and for a mains superintendent at a wage of 6d. a week more.

When I was young and very fly
I thought the world was all awry;
I studied books on politics
Learnt all its "isms" and its tricks.
In short—I found for perfect rhythm
We all should plump for communism.

So when my father said to me,
"Now, boy, what do you choose to be?"
All his proposals I turned down—
They might bring money, fame, renown.
I answered, "I shun profiteering.
My predilection's engineering."

"For there, no matter what your age,
You always get the same low wage,
And though you rise to be the chief
It never brings you much relief.
The slide-rule calculating joker
Is just the equal of the stoker."

But now I'm nearing fifty-four
My views are not quite those of yore.
My communistic life has seemed
Not quite the heaven that I dreamed.
In fact—I fear I'm growing slacker.
I've thought of selling tripe, or 'bacca.

Corona Discharge.—Under this title a recent issue of *The Iron and Coal Trades Review* gives details of an exhaustive investigation carried out at the University of Illinois.

The authors considered that a study of the corona caused by continuous potentials may produce engineering data of value owing to the increasing development of high-tension direct-current generation and transmission, and for this reason the experiments were conducted with continuous potential.

The type of the corona discharge tube used in most of the experiments was a cylinder with a wire strung along its axis. This type of tube was chosen for several reasons:—(1) The corona phenomena occurring when this type of apparatus is used lend themselves peculiarly well to mathematical analysis. (2) The construction, manipulation, operation, and repair of the apparatus are extremely simple. (3) The field distribution is symmetrical with respect to the wire, and any irregularities in the wire are immediately recognisable in the discharge. (4) This type of apparatus has been used by other investigators; thus results could be compared with greater assurance of reliability.

As the voltage across the corona apparatus is gradually raised a point is reached when a marked increase in the current occurs, and a further increase in voltage causes the current to increase very rapidly. The voltage at which this sudden increase occurs is called the "critical voltage." "Visible glow voltage" means the voltage at which the light about the wire first appears. The visible glow voltage may be identical with, or higher than, the critical voltage.

The positive and negative coronas have entirely different appearances.

Wire Positive in Air.—For all pressures and sizes of wire used a uniform purple glow surrounds the positive wire. The wire has a tendency to vibrate at high pressures and high current densities. The thickness of the luminous film seems to be a constant for all current densities and pressures, the density or brilliance of the discharge only varying with the current and pressure.

Wire Negative in Air.—With the wire negative the appearance of the corona is changed in a very marked degree. The following properties can be observed:—(1) With a constant wire diameter and decreasing pressure the discharge gradually changes from a fairly uniform luminous mass with ragged boundaries to a beady discharge. (2) For a constant pressure and decreasing wire radii the fairly uniform luminous discharge gradually changes to the beady discharge, so that for small wires (less than 0·17 mm. in diameter) the beady discharge occurs at all pressures between atmospheric and 50 mm. of mercury. Under certain conditions of pressure and voltage these negative beads, or brushes, distribute themselves uniformly along the wire. For the lowest pressures the beads consist of a bright cylindrical core along the wire, this core being surrounded by a narrow dark space and enveloped in turn by a purple glow of relatively large diameter. For increasing pressures the central core contracts to a point on the wire, from which the discharge spreads out fanlike in a plane at right-angles to the wire. For still higher pressures the fan seems to close and finally to degenerate to a small brush.

Moisture.—To determine whether the presence of moisture in the air has an effect upon the critical voltage, a test was run as follows under a pressure of 736 mm. and humidity 68·5 per cent. Air was drawn from the room through the tube, and the voltage was noted at which the initial jump of the galvanometer occurred for the wire positive. The positive glow voltage and the negative glow voltage were then determined. Then dry air was pumped through the tube and the same measurements were taken. The results were:—

	Wet air.	Dry air.
Positive critical voltage	4,300	4,190
Positive glow voltage	4,350	4,260
Negative glow voltage	4,275	4,370

The effect of moisture apparently is to raise slightly the starting point of the positive corona, but the reverse is true for the negative polarity.

Slight differences in the starting points for the different metals were noticed; these differences, however, are of such a nature that they cannot be explained as being experimental errors. Steel and copper seem to have about the same starting point, while that for aluminium is a little higher and silver has a value still greater. The different metals not only affect the behaviour of the characteristic curves but also the starting points of the corona glow.

The voltage used for the experiments varied considerably, but did not much exceed 9,000 volts.

Naval Wireless Telegraphists.—In order to assist ratings of the wireless telegraph branch of the Royal Navy due for discharge in obtaining posts as civilian wireless telegraph operators, the Admiralty has arranged with the Postmaster-General for the issue of the latter's certificate of proficiency to such ratings on their passing an examination in the naval signal schools while still serving. It has not been possible for the Admiralty to make similar arrangements for the examination of telegraphists who have been discharged or demobilised, and such men should apply for the certificate direct to the Secretary of the General Post Office, who will inform them of the conditions of the examination.—*The Times.*

Service Notes.—The Admiralty announces that rules have been approved for determining the dates from which officers specialising in engineering shall become eligible for the higher rates of pay laid down for the engineer branch in July last, as a result of the Halsey Committee's recommendations.

Lower-deck Improvements.—A recent note in *The Times* foreshadows a great improvement in the living conditions of petty officers of some of the Navy's light cruisers. Electric lighting is to be installed in messes and reading-rooms, and electric heaters for keeping meals hot, as well as radiators and other appliances.

INSTITUTION NOTES.

Institution of Electrical Engineers.—The forty-eighth annual general meeting of the Institution was held on the 20th inst.; there was a very small attendance, and few comments were made. The President, Mr. Roger T. Smith, announced the result of the election of members of Council, as follows:—

President, Mr. Ll. B. Atkinson; vice-presidents, Dr. W. H. Eccles, Messrs. J. S. Highfield, and S. L. Pearce, C.B.E.

Digitized by Google

hon. treasurer, Sir J. Devonshire; ordinary members of Council, Messrs. F. Gill, P. V. Hunter, A. H. W. Marshall, W. Noble, C. Vernier, and Dr. A. Russell.

Out of the total of 1,526 ballot papers that were returned, 29 were spoiled, leaving 1,497, or about 32 per cent. of those issued, which was a good improvement on past years.

The President introduced the report of the Council for the year 1919-20, an abstract of which appeared in our last issue, with a running commentary, in the course of which he mentioned that the gratifying increase in membership was to some extent an estimate, as there were a number of members whose subscriptions had lapsed, and they were not yet sure how many of them had definitely ceased to be members. He pointed out that although the number of subscribers to the Benevolent Fund had increased substantially, the amount subscribed had remained practically at the same level as before. Referring to the benefaction to the Institution announced in the report, he said that both the donation and the manner in which it was given, were admirable examples to them all, and trustees had been appointed for the Institution. To the list of territorial centres and sub-centres that had been visited by the President during the session, Loughborough could now be added. Owing to the continued increase in the cost of publication, the Council regretted that it had been compelled to increase the subscription rates for *Science Abstracts*. The premiums awarded by the Council for papers read before the Institution during the period April 10th, 1919, to April 15th, 1920, were then announced, as follows:—The Institution premium, valued at £25, to Mr. M. B. Field for his paper on "The Navigational Magnetic Compass"; Ayrton premium (£10) to Mr. W. H. Patchell for his "Notes on Operating a By-product Producer-Gas Plant for Power and Heating"; Fahie premium (£10) to Messrs. E. A. Laidlaw and W. H. Grinsted for their joint paper on "The Telephone Service of Large Cities, with Special Reference to London"; John Hopkinson premium (£10) to Mr. J. C. Thompson for his paper on "Transformers for Electric Furnaces"; Kelvin premium (£10) to Mr. H. W. Taylor for his paper on "Eddy Currents in Stator Windings"; Paris premium (£10) to Mr. G. Stead for his paper on "The Short Tungsten Filament as a Source of Light and Electrons"; Webber premium (£10) to Major A. C. Fuller for his paper on "The Fullerphone, and its Application to Military and Civil Telegraphy"; an extra premium (£5) to Captain J. M. Scott Maxwell for his paper on "Scientific Management: a Solution to the Capital and Labour Problem"; and another extra premium (£5) to Major K. Edgcumbe for his paper on "The Protection of A.C. Systems without the Use of Special Conductors."

The motion to receive the report was seconded by Mr. J. Shepherd, and, without comment, the report was adopted unanimously.

Sir James Devonshire, in moving the adoption of the accounts for the year ended December 31st, 1919, said that that was his first presentation of the accounts since the resignation of his able predecessor, Mr. Kingsbury. The cost of publication of the *Journal* continued to increase. The temporary housing of the Institution at Albemarle Street was, from a financial point of view, entirely satisfactory, as the Institution thereby benefited to the extent of nearly £4,000. Negotiations had been opened for the sale of the Tothill Street property, and he was glad to announce that there were prospects of disposing of the property on favourable terms. The accounts showed a margin to the good of £1,495, an increase of £225.

Prof. J. T. MacGregor-Morris seconded the motion; few remarks were made, and the accounts were adopted unanimously.

Messrs. Allen, Attfield & Co. were appointed hon. auditors for the year 1920-21, and the proceedings terminated with votes of thanks to the Institution of Civil Engineers for the use of its premises and library, and to the hon. officers of the Institution at home and abroad.

North Midland Centre.—The annual meeting of the Centre was held at Leeds on May 11th. The chairman (Mr. W. M. Selvey) presided. The accounts for the past year were unanimously approved. The ballot for members of the committee for the ensuing year resulted in Messrs. Furness, Jones, Spurr, Turner, Col. Vignole and Mr. Wraith being elected. Mr. Leonard Milne then read his paper on the "Electrical Equipment of Artisan Dwellings," and a discussion followed.

Local Centre in Argentina.—The first Committee is made up of the following members:—

Chairman: Vernon Lindop.

Vice-chairman: W. C. Laidler.

Members: J. T. Cornish, H. L. Randolph, L. B. Trant, and J. Wilson.

Secretary: A. C. Kelly, 783 calle Florida, Buenos Aires.

The Committee will be glad to be of assistance in any matter affecting the interests of the British Electrical Industry and of British Electrical Engineers.—*Review of the River Plate.*

Society of Chemical Industry.—Modern High-speed Electric Telpherage was the subject of a paper at a Conference of the Chemical Engineering Group (National) of the Society of Chemical Industry, at Birmingham, on April 23rd. The author, Mr. H. Blyth (Strachan & Henshaw, Bristol), pointed out that in all branches of industry there was a necessity to-day for doing everything at high speed and with the greatest all-round economy. The electric telpher was a particularly convenient and simple machine for conveying any class of goods or materials over a moderate distance with a minimum consumption of energy and at a low maintenance cost. Telpherage had been very extensively adopted in gas works for handling coke and other materials, and also in electricity works for coal and ashes.

A coal telpher, fed by crane, was installed at Stepney electricity works. It was not permissible in this case to have the telpher structure overhanging the barge, and a three-motion crane had to be used to transfer the coal from the barge, first to the hopper of the automatic weighing machine, which in turn discharged the coal to the bunker which fed the telpher skip. The supply of coal was kept up in the bunker, and the telpher operator lowered his skip in front of the automatic shoot; the skip was filled in about 10 seconds (two tons of coal), lifted 40 ft., and carried a maximum distance of about 300 ft. The capacity (guaranteed) of the plant was 40 tons per hour, but in an emergency 70 tons per hour had been handled.

In 1916 Messrs. Nobels required to unload coal from 10-ton wagons and store it evenly over an area of 350 ft. × 136 ft. × 10 ft. deep, and it was necessary to provide for a storage of 12,000 tons. The coal trucks are emptied by a Fraser & Chalmers tipper, at the rate of eight to ten per hour, into a pit which has a partition at a depth of 15 ft. and a chamber 7 ft. deep below this partition. Coal can be lifted by the telpher and grab from the upper portion of the pit at the rate of 40 to 50 tons per hour, and conveyed to store, and simultaneously conducted at about the same rate by means of a rotary feed table, below the partitions, to an elevator, and thence by a band conveyor to the boiler-house bunkers. The special feature of the telpher installation lies in the fact that the track itself is made to travel the full length of the store ground, and by means of a running switch maintains contact with the fixed track leading to the grabbing pit. The telpher machine can thus lift the coal from the pit and convey it directly to any part of the store ground, and similarly pick up from any point of the store and carry it back to the pit for feeding the elevator and conveyor for the boiler house. It was not possible in this case to run the track through to the boiler house, as the structure for the latter had already been determined when the telpher was ordered for the store.

The telpher has a lifting motor of 20 H.P. and a travel motor of 8 H.P., the energy consumption per hour being 6 units—that is, 0·15 unit per ton. The present-day labour cost would be ¾d. to ¼d. per ton. The elevator is driven by a 10-H.P. motor, and the band conveyor, 5 H.P.; total consumption, 11 units per hour.

Societe des Ingenieurs Civils de France.—This institution is organising a tour in France, from June 22nd to 25th, primarily for its British section, but it has been decided to admit members of any recognised British engineering institution. The tour, which embraces Paris and the factories and mines of the north-eastern war area, including Amiens, Lens, Lille and Vimy, will cost about £12, and a programme has been arranged and can be obtained from the Hon. Secretary of the British Section, 45, Great Marlborough Street, W. 1.

Institute of Transport.—Reading a paper on "Some Railway Operating Problems," on May 17th, Major-General Sir H. W. Thornton, general manager and engineer-in-chief of the G.E. Railway, said he hoped to increase the already heavy train service during the rush periods by 40 per cent. The trend of thought was towards private ownership and administration under Government regulations. To deal with the London traffic problem, in addition to other improvements, they must employ electricity in the suburban zone on a very large scale.

British Science Guild.—At the annual meeting of the Guild, to be held at the Goldsmiths' Hall, Foster Lane, E.C., on Tuesday, June 8th, at 3 p.m., Lord Sydenham, G.C.S.I., F.R.S., in vacating a Presidency marked by two most successful Scientific Products Exhibitions, will deliver an address on "Science and the Nation," and this will be followed by an address on "Some National Aspects of Transport," by the incoming President, Lord Montagu of Beaulieu. Lord Bledisloe and Sir Gilbert Parker will indicate what has been done in the past year in this connection, and describe the significant efforts now contemplated by the Guild. Applications for invitations to the meeting should be addressed to the Secretary of the British Science Guild, 6, John Street, Adelphi, W.C. 2.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the Electrical Review *posted as to their movements.*

Mr. Weston has resigned from the Sterling Telephone and Electric Co., Ltd., and has joined Cryselco, Ltd., as London representative, with office at Craven House, Kingsway.

Mr. E. G. Phillips, M.I.E.E., who for the last 12 years has been chief engineer to Messrs. Boots Chemists, Nottingham, has resigned that position and opened offices at Queen's Chambers, King Street, Nottingham, as a consulting engineer, specialising in power plants working against back pressures, and utilising the exhaust for "process" work. On Friday last at the Island Street works, over 100 of the power house staff and engineering department presented Mr. Phillips with a secretarial desk. Mr. T. S. Ratcliffe, general manager, made the presentation, and Mr. H. B. Clarke, chief technical assistant, expressed the staff's esteem and appreciation.

Recent changes in the civilian staff at the Admiralty outports, include the following:—Electrical Engineering Department—Mr. H. Martin, to Electrical Engineer, Lower Grade, Portsmouth

Digitized by Google

Yard (Acting); Mr. W. A. Knight, to 1st Assistant Electrical Engineer, Portsmouth Yard; Mr. G. R. Davies, to 1st Assistant Electrical Engineer, Dover Yard (Acting).

Mr. J. W. A. Renshaw, assistant electrical engineer of Fleetwood, has been granted an additional bonus of £30 per annum.

On May 21st, Mr. F. C. Edgars, foreman armature winder to the Halifax Tramways Committee, was presented with a silver flower vase by the members of the staff. He is about to start business in the electrical trade on his own account. He had been with the Corporation over 20 years.

Lieut. H. Foster Smith, R.E., M.C., has been appointed chief engineer to the Electric Lighting and Tramways Co, Para, North Brazil.

Lieut. Breeds, of Morecambe, has been appointed traffic manager to the Morecambe Corporation.

A Reuter dispatch states that Sir Auckland Geddes, on May 19th, received the Franklin Medal from the Franklin Institute for Sir Charles Parsons.

Messrs. Charles P. Sparks & Partners have changed their address to Blackfriars House, New Bridge Street, London, E.C. 4. Telephone Nos. "4725 and 4726 Central."

Mr. T. MacLennan, first engineer at Lake Coleridge hydro-electric station, New Zealand, has been appointed public works electrical engineer at Hamilton (N.Z.), and will take charge of the Hora Hora works. Mr. H. S. Dix, engineer and manager of the Prahran and Malvern tramways trust, has been appointed acting chief manager and acting chief engineer of the Melbourne Tramways Board, which controls the cable and electric tramway services of the metropolitan and suburban areas.—*Commonwealth Engineer.*

Obituary.—Mr. R. Sharp.—The death has taken place of Mr. Robert Sharp, of Briercliffe Road, Burnley, who had been for many years in business as an electrician. He was in his 59th year.

CITY NOTES.

London and Suburban Traction Co., Ltd.

Lord Ashfield presided at the annual meeting on May 19th. He said that the result was disappointing, but no other result could have been expected considering the expenses and how little the fares, &c., had been advanced. Increased operating expenses more than counterbalanced the increase in revenue of the three companies. There were no signs of any decrease in the price of materials necessary for the operation and upkeep of the undertakings, and further demands were received for increases in the wages of the operating staff. It was therefore essential that more revenue should be earned. The Government had introduced the Tramways (Temporary Increase of Charges) Bill, which, while it did not afford a permanent measure of relief, would give the companies an opportunity of increasing their revenue by bringing the fares more into relation with the present economic position and with the expenses of carrying the traffic. It remained to be seen to what extent the public would accept this additional burden, but he could not but believe that they would be willing to pay such fares as might be necessary to meet reasonable working expenses and to provide adequate sums for depreciation and a fair return on capital. There was a rate of fare which would secure the maximum earnings, and to go beyond that rate of fare would reduce the earnings and bring disaster to the undertakings. He would, therefore, take that opportunity of warning those who were constantly agitating for increased wages that they could overburden the undertakings and bring disaster to themselves and to all those associated with them. The tramway and omnibus undertakings in which their company was interested were not earning sufficient to meet their actual expenses, and until fares had been increased and it was known definitely just how much the public would pay, and whether sufficient revenue could be obtained to meet even the present expenses, including depreciation and a reasonable return on capital, it was difficult to see how further increases in expenses could be incurred.

Calcutta Electric Supply Corporation, Ltd.

The report for 1919 shows as follows: Units sold 31,881,710, as against 30,431,132 in 1918. Houses connected 10,271, an increase of 374. Gross revenue £359,949, against £304,955. Net revenue £237,206, against £173,949. The net profit for 1919, plus balance brought forward and interest received, totalled £298,459. £34,408 has been placed to the credit of the depreciation and renewals account. The balance of excess profits duty in respect of 1917-18 £27,724, and an estimated liability in respect of 1919 for similar duty £34,070, is provided for. £55,000 is put to reserve, £5,000 to the insurance fund, £5,000 to the pension fund, and a final dividend is recommended on the ordinary shares for the second half-year of 6 per cent. actual, making 10 per cent. for the year. Further, it is recommended that, subject to the shareholders' approval and to the alteration of the articles of association, one fully-paid preference share shall be issued as bonus for each 10 ordinary shares held, fractions to be paid in cash. A balance estimated at £45,693 is carried forward after providing for the directors' additional remuneration of £4,000. Expenditure on capital account last year £51,653. Total outlay to December 31st last £1,48,000. The demand for electrical energy still continues to increase. In order to meet the same, after considering a report on the situation from their consulting engineers in conjunction with the company's engineer, that the capital should be increased, the directors find themselves inevitably committed to an increase of the system involving 1½ millions sterling. The power station must be more than doubled, and the network of distribution in proportion; they therefore recommend that the capital shall be increased from £1,500,000 to £3,000,000 by the issue of 300,000 additional shares of £5 each, also that the rate of dividend payable in respect of the preference shares be increased from 5 to 6½ per cent.

Swedish Companies.

The Elektriska Aktiebolag Volta reports that a total loss of 1,129,000 kr. was incurred in 1919, of which 656,000 kr. concerned the manufacturing departments, as compared with net profits of 555,000 kr. in the previous year on a share capital of 5,000,000 kr. All the subsidiary companies are being liquidated, and the Volta company itself is to be reorganised by the formation of a new company with a share capital of 6,500,000 kr.

The directors of the *Telefon A.B. Cedergren, of Stockholm*, reporting on the past year, states that the network in Warsaw was for the most part restored after the damages caused during the German occupation. The company's concession expired on November 14th, 1919, and a provisional agreement was entered into with the Polish Ministry to continue working until July 1st, 1920, whilst negotiations were proceeding as to the conditions for further maintaining the service. The total loss for the year amounts to 1,889,000 kr., of which 883,000 kr. represents the writing down of Russian debts.

The report of the *A.B. Elektraverken* states that the situation of the market in 1919 was not satisfactory for the company's manufactures. The unfavourable conditions of exchange facilitated foreign competition, and compelled the company for the present to cease the production of batteries and thermo flasks, and rendered impossible the export of other manufactures. The results were also prejudicially affected by a three months' strike at the installation materials factory, and the great advance in wages. As net profits the accounts show the sum of 557,000 kr., as against 713,000 kr. in 1918, when a dividend at the rate of 10 per cent. was paid. It is, however, not proposed to make any distribution for last year, but to dispose of the surplus available by allocations to the renewal and reserve funds, and by the carrying forward of 318,000 kr., as compared with 157,000 kr. in 1918.

French Companies.

The Compagnie de Telegraphie Sans Fil reports net profits of 2,525,000 fr. for 1919 and a dividend of 40 fr. per share, this comparing with 27.22 fr. per share for the eleven months comprising the previous financial year.

The Société d'Electro-Chemie de Bozel has declared a dividend at the rate of 22 fr. per share out of net profits of 762,000 fr. in 1919, as against 22 fr. and 766,000 fr. respectively in the previous year.

The net profits of the *Société Gramme* in 1919 are reported at 697,000 fr., as compared with 703,000 fr. in the previous year. After making allocations to the legal reserve fund and provision for the tax on war profits, there remains a balance of 402,000 fr., permitting of the payment of a dividend of 50 fr., as against 48 fr. per old share and 25 fr. per new share in 1918.

The Société d'Electro-Chimie et d'Electro-Métallurgie, which last year absorbed the Electro-Chimique du Giffre et des Carbures Métallurgiques and increased the share capital from 18 to 35 millions of francs, reports net profits of 3,855,000 fr. for 1919 as compared with 1,546,000 fr. in 1918. It has been decided to pay a dividend of 45 fr. per share on the augmented capital, this contrasting with 50 fr. per share in the previous year.

Babcock & Wilcox, Ltd.

The net profit for 1919 was £455,089, plus £92,089 brought forward. After paying the interim dividends of 3 per cent. and 2½ per cent. on the preference shares, and 6 per cent. on the ordinary, further dividends at the same rates on the preference and 9 per cent., free of income tax, on the ordinary shares, are to be paid; £150,000 is to be put to reserve; £10,000 is to be put to staff pension fund; and £123,225 carried forward. The capital has been increased by 500,000 ordinary shares, but these do not rank for the dividend now announced on the old ordinary shares. The construction of the works of the Sociedad Espanola de Construcciones Babcock & Wilcox will be completed this year. The company is equipping auxiliary works in Australia and Italy, and is extending its Japanese works. The French B. & W. works, in which the company is interested, have been enlarged and the capital of that company increased. At Renfrew considerable extensions are being undertaken; a new foundry and pipe shop are being built, the crane making department is being enlarged, and new offices are being erected. Extensions are in progress at the Dumbarton works. The use of B. & W. marine boilers is increasing, and the amount of orders in hand for all the company's manufactures is satisfactory. "Whilst there is some improvement noticeable in the output of our workmen, it is still below the pre-war standard, and there are also continual interruptions, through trade disputes, to contend with."

Belgian Companies.

The accounts of the *Ateliers de Constructions Electriques de Charleroi* show total profits of 2,703,000 fr. for 1919. It is therefore possible to extinguish the provisional debit balance of 2,337,000 fr. which existed at the end of 1918, pay interest on the loans, and carry 209,000 fr. forward.

The Compagnie des Railways et de l'Electricité reports net profits of 359,000 fr. for 1919, which sum has been carried forward. At the recent general meeting the chairman stated that the company hoped to resume the payment of dividends next year, and the directors were devoting special attention to industrial undertakings which were more remunerative than tramways and supply works.

The Société Générale Belge d'Entreprises Electriques reports net profits of 784,000 fr. for 1919, and a dividend at the rate of 25 fr. per share has been declared on the old capital and 1.67 fr. per share on the partly-paid shares. The report states that the supply works in which the company is interested have profited in general by the resumption of industrial activity, especially as the use of electricity is becoming general, and electric motors are being increasingly adopted both by small and big industries. At the same time, the public authorities in most cases have sanctioned an advance in supply tariffs and in tramway fares.

German Companies.

The directors of *Voigt & Haeffner A.G., of Frankfort-on-Main*, recommend a dividend at the rate of 18 per cent. for 1919, being the same as in the previous year.

The accounts of the *Elektro-Salpeterwerks A.G., of Berlin*, show net profits for 1919 which permits of the reduction of the debit balance from 1,420,000 marks to 1,380,000 marks.

The *Norddeutsche Seekabel Werke A.G., of Nordenham*, after making provision for depreciation and losses on investments, reports a loss of 47,000 marks for 1919, as compared with net profits of 291,000 marks in 1918.

The *Ver. Isolatoren Werke A.G., of Berlin-Pankow*, after making provision for depreciation, reports net profits of 166,000 marks for 1919, as compared with 126,000 marks in the preceding year. The directors recommend a dividend at the rate of 12 per cent., this comparing with 10 per cent. in 1918.

The accounts of the *Elektrochemische Werke, of Berlin*, after writing off 2,100,000 marks for special depreciation on new plant in 1919, as against 900,000 marks in 1918, show net profits of 2,629,000 marks, as compared with 1,926,000 marks in the previous year. It is intended to distribute a rate of 15 per cent., this comparing with 12 per cent. in 1918.

The accounts of the *Bergmann Elektrizitats Werke A.G., of Berlin*, show gross profits of 22,162,000 marks for 1919, as compared with 23,683,000 marks in the preceding year. After providing 1,937,000 for depreciation, as against 2,578,000 marks, the net profits are returned at 7,448,000 marks, as compared with 7,149,000 marks in 1918. It is proposed to pay a dividend of 12 per cent. on the paid capital of 47,750,000 marks as in the previous year. The unpaid capital is to be called up, and the share capital then increased by 28,000,000 marks to 80,000,000 marks.

Neuhausen Aluminium Industry Co.

The report for 1919 of the Aluminium Industrie A.G., of Neuhausen, states that the expectations that with the conclusion of peace the conditions of production and sale would revert to normal paths, and relief take place in the provision of raw materials, had not been fulfilled. On the contrary, increased difficulties had to be contended with in order to supply the works with raw materials. With the exception of the Lend works in German Austria it was possible to maintain restricted working at all the manufacturing plants, and the production under these circumstances was less than in the preceding year. In addition to the large decline in the output, the unfavourable conditions of exchange, the enormously increased wages, and the advance in the cost of raw materials and freights, were the causes of the less favourable results as contrasted with the preceding year. The gross profits, including the balance forward declined from 38,062,000 fr. in 1918 to 16,390,000 fr. last year. After considerably reducing the amount provided for depreciation as compared with 1918, the net profits have fallen from 12,093,000 fr. in the latter year to 8,821,000 fr. in 1919. As recently mentioned, the dividend is at the rate of 18 per cent. on ordinary share capital of 42,000,000 fr., this comparing with 20 per cent. in 1918 and 20 per cent. in each of the three preceding years on considerably less capital. The report further states that the seizure of the works in France had not yet been raised, although speedy settlement was to be foreseen. The Hungarian Bauxite Co. had to suspend activity after the revolution, and had not yet been able to resume. Nevertheless the Neuhausen Co. possessed large stocks of bauxite which would last a long time forward.

Edison Swan Electric Co., Ltd.—The financial Press states that the directors propose to increase the borrowing powers of the company.

Brisbane Electric Tramways Investment Co., Ltd.—Dividend of 8 per cent. per annum, free of tax, on ordinary shares for half-year, making 8 per cent. for the year; £20,000 to reserve; £38,876 carried forward.

Potteries Electric Traction Co., Ltd.—Mr. R. J. Howley, presiding at the annual meeting, said that the traffic receipts amounted to £251,745, an increase of £46,221, due to a small increase in traffic and a further increase in fares. The administration and general expenses increased by £5,022. The introduction of the 48-hour week in April, 1919, had caused the largest single increase in wages which they had had to meet in any year, being equivalent to 13s. per man per week on the old basis of a 60-hour week. In November a further 4s. a week had been granted by an award of the Committee on Production. A further increase of 8s. per man per week, which would rise to 9s. on June 1st next, recently recommended by the National Industrial Council, was now being paid. Increases in wages during the year had out-distanced the increased cost of living, and there must be some finality to the increases which could be granted. Wages continued to advance, and the raising of additional revenue became more difficult. Their efforts had not been unsuccessful during the year under review in maintaining the balance available for distribution, but there was a limit to which fares could be raised.

Richardsons, Westgarth & Co., Ltd.—The profit for the year ended December 31st, after providing for estimated liabilities to the Government, amounts to £185,040, against £133,275 in 1918, to which is added £23,818 brought forward. One year's arrears of preference dividend to April 30th, 1912, paid June 17th, absorbed £21,000; two years' arrears of preference dividend to April 30th, 1914, paid November 28th, £42,000. It is proposed to allocate £45,000 to depreciation for 1919; portion of capital expenditure in 1919, written off, £13,565; leaving a credit balance of £48,842. The company's liability for excess profits duty for the past four years has not yet been finally adjusted, but it is estimated, says the *Times*, that out of the retainable profits for the year 1919 a total payment of £105,000 can be made to the preference shareholders. Of this sum, a distribution of £63,000, as shown above, has already been made, and it is now proposed to pay £42,000 out of the balance of profit remaining; the dividend on the preference shares will then have been paid to April 30th, 1916.

Arbroath Electric Light and Power Co., Ltd.—Mr. George Balfour, M.P., said at the annual meeting that the present consumption of current was about 30 per cent. greater than that of a year ago. Naturally this increase of business, he said, required an extension of their plant and machinery and cables, and each, of course, meant additional capital. After referring to the arrangements for the increase of capital, he said it was not the intention to issue all the new shares at one time, but the directors had thought it wise to make ample provision, and shares would be issued as and when fresh capital was required. A special vote of thanks was passed to the engineer (Mr. J. Cathcart Christie) and his staff.

Anglo-American Telegraph Co., Ltd.—The three quarterly interim dividends on the preferred and ordinary stock absorbed £157,500, and the directors on January 31st last paid the final dividend of 30s. per cent. for the year on these shares and on the deferred stock. These payments absorbed altogether £262,500, being the rent paid by the Western Union Telegraph Co. for the year, equal to 3¾ per cent. on the ordinary stock, 6 per cent. on the preferred stock, and 1¼ per cent. on the deferred stock. The balance at credit of revenue account (£68,822) includes £3,197 interest received, and the balance of £65,625 is available for the payment of dividends for the quarter to March 31st, 1920.

Stock Exchange Notices.—The Committee has ordered the undermentioned to be officially quoted:—

Erinoid, Ltd.—100,000 shares of 5s. each fully paid (Nos. 600,001 to 700,000).

Greenwood & Batley, Ltd.—168,000 ordinary shares of £1 each, fully paid (Nos. 1 to 168,000); and 96,000 7 per cent. cumulative preference shares of £1 each, fully paid (Nos. 1 to 96,000).

The Committee has specially allowed dealing in the following under temporary regulation 4 (3):—

River Plate Electricity Co., Ltd.—122,440 ordinary shares of £1 each, fully paid (Nos. 175,001 to 297,440).

Ramsgate & District Electric Supply Co., Ltd.—Profit for 1919 £4,247, as against £2,026 for 1918. After deducting interest on outstanding accounts due to contractors (£1,132) and adding £743 brought forward, the balance is £3,857. Dividend 5 per cent.; £2,000 to reserve; £857 carried forward. Mr. A. N. Rye has been elected a director in place of Mr. A. D. Chamen, resigned.

Mirrlees Bickerton & Day, Ltd.—The report for the year ended March, 1920, states that the net profit, after providing for depreciation and excess profits duty, &c., is £41,842, plus £5,720 brought forward. It is proposed to pay a dividend on the ordinary shares, making 12½ per cent., free of tax, placing £5,000 to reserve, and carrying forward £7,510.

British Mannesmann Tube Co., Ltd.—Interim dividend of 4 per cent., less tax.

Digitized by Google

Dublin and Lucan Electric Railway Co.—At the annual meeting Mr. J. W. Hill said that the gross income had largely exceeded that of any previous year. The increase was accounted for to a certain extent by the increased passenger fares, but the increase in the number of passengers as against those carried in the previous year was almost 52,000. The service was still curtailed, but it was hoped to improve it. As to expenditure, wages were double the amount of 1918 and coal was dearer, while the coal supply prospects were anything but reassuring.

Companies Struck off the Register.—The following have been struck off the register and are dissolved:—

Faringdon Electric Light and Power Co., Ltd.
Star Vacuum Cleaner Co., Ltd.

Western Telegraph Co., Ltd.—Interim dividend of 5s. per share, free of tax.

STOCKS AND SHARES.

TUESDAY EVENING.

STOCK EXCHANGE markets appear to be the better for their Whitsun holiday, and a fair amount of business rewarded those who were sufficiently conscientious to return to town to-day (Tuesday). The holiday passed without giving rise to any unexpected complications at home and abroad, so there was nothing to check the mildly better tone established at the end of last week.

The dramatic drop in many prices in the commodity, food and metal markets is regarded from various points of view. New York sends apprehensions as to its further course being undesirable in view of possible slump consequences in the market for Government and other securities, and this aspect naturally occurs to the holder of stocks and shares, the prices of which are bound to suffer if forced liquidation goes to extremes. At the same time, it is well recognised that the fall in Stock Exchange prices has been extremely severe during the past two months, and that the forced selling has been accomplished to no small extent already. The City, therefore, is not alarmed at the outlook, and the manner in which gilt-edged stocks are supported is evidence of the investors' frame of mind.

People are buying preference shares and fixed interest stocks to-day on the ground that dividends on ordinary shares are likely to be eaten into by the additional E.P.D., and that this may make material difference to the dividends on ordinary shares. In these circumstances, the attractions stand out from such investments as General Electric 7½ per cent. B preference, which can be bought at about 19s. 3d., and are representative of the class of shares for which the investor is now asking. No doubt the course of time will bring the ordinary shares into favour again, but—equally no doubt—preference issues are more popular with the public at present.

Electricity Supply shares are weaker on account of several decreased accounts which have come to market this week. County ordinary and preference have felt this more particularly, but London Electrics and Metropolitans also gave way. City Lights are quoted in their £1 (instead of £10) guise, the ordinary being called 1⅛ and the preference 17s. At these prices the former give a return of nearly 9 per cent. on the money, and the preference offer a little over 7 per cent. Calcutta Electric Supply are 5s. lower at 8, although the report is regarded as being quite a good one.

Edisons at 23s. 9d. have hardened up; otherwise the manufacturing group is dullish, with General Electrics easier at 31s. 3d., and Siemens at 26s. Henleys shed 1-16 to 40s. Castner Kellners recovered to 4 on the declaration of an interim dividend at the rate of 20 per cent.

The International, which took over a large part of the Automatic Telephone shares, issues a report dealing with the share capital and other figures, but which is otherwise colourless. American and other dollar securities are lower in many cases, the New York Stock Exchange being subject to depressing conditions due to causes not unlike those which have made prices dull over here. Cuban Telephone 6 per cent. preference fell 2 to 120, and American Telephone and Telegraph capital stock dropped to 117¼. Rio Tramways 1st mortgage bonds weakened to 82½. Brazilian Tractions reacted to 49½, after being above 50. The Anglo-Argentine Tramways list is rather firmer, the first preference hardening to 3⅛. Mexican Light and Power firsts at 41 are 5 points better on the fortnight. The death of President Carranza has had little effect other than this upon Mexican issues. Stock Exchange opinion, already quoted, persists that no change can be for the worse in Mexico.

Cable stocks are as langourous as the weather. Anglo-American deferred continues its downward course. Globe ordinary shares are 5s. lower. West India and Panama have given away further to 10s. owing to the poor report. Shares changed hands down to 8s. 6d. Marconis remain a firm market at 3½, but the new ordinary are still at 2s. 6d. discount, and Marines are 1-16 better at 38s. 9d.

Reference was made here last week to Atkin's "Manual." To quote further from its pages may appear to savour of laziness on the part of the commentator, yet, in these kaleidoscopic days, it is very interesting to have a lucid reminder of the Electricity Bill (1919) which is now law. Risking the charge just mentioned, we repeat from the Manual before us: "This Bill, owing to strong opposition in the House of Lords, directed specially against its financial proposals, was considerably modified . . . all its compulsory features withdrawn, and the proposals relating to the appointment of Commissioners and the control and advice which they are enabled by the Act to give in connection with the development of electricity were retained." The power enjoyed by the London County Council to purchase in 1931 the undertakings of all the companies together for fair market value without goodwill (Electric Lighting Act, 1888) is now transferred to the Joint Electricity Authorities for the area in which a company operates. This is how the position stands at present, and the element of uncertainty which obviously continues to exist is sometimes held responsible for the reluctance that many investors entertain in regard to putting money into electric lighting shares.

Home Railway stocks are more or less moribund. The vast numbers of passengers carried by the motor-'buses during the Whitsun holiday has failed to infuse any interest into the market for the Underground Railways group. Armament shares make a fairly good showing, with Vickers hardening slightly. Rubber shares rallied on the raw material picking up to a florin per lb., which brought in a few buyers and a great many inquiries.

THE LOWER SEVERN ELECTRICITY DISTRICT.

By H. M. S.

(*Concluded from page* 647.)

If the Commissioners sought for an area in which the industrial and population factors vary widely with a large proportion electrically undeveloped, so that their first scheme may be tested through a considerable range of conditions, this area seems to offer a good opportunity. It may be only a coincidence that Hereford, which is in the district, has the only supply undertaking which has definitely tried to cater for agricultural demands. There are those who think that electric supply in rural districts will prove of social and economic value, providing some encouragement to the development of village and home industries, some social amenities, as well as assistance to the agriculturist, and thereby promote an increase in the rural populations which social reformers agree to be desirable.

This district gives the Commissioners an opportunity of testing the theory, if they or others can finance the enterprise.

Another feature of the district is that outside Bristol and Bath the existing supply stations are on the small side, situated in small towns, each isolated from its colleagues by relatively considerable distances, so that interlinking is hardly practicable or of advantage. Also, no part of the area, excepting the Severn shore, appears to offer any facilities for the operation of a large economical station, whilst all parts of it can be reached by transmission lines not exceeding about 50 miles in length, a length which is very moderate compared with American and Continental practice. The conditions, therefore, give a super-station a rather better opening to show its utility, than will be the case in some other areas. It may prove that some of the small isolated stations will find a bulk supply cheaper than their own generating costs, especially as regards any increase in load.

Clearly, if this idea is in the Commissioners' minds, its success depends very much upon the way in which the possibility of supply stimulates the growth of demand throughout the district. As so much of it, including many large villages and small towns, is without a supply now, it is safe to suppose that there is already some unsatisfied demand to start with.

Authorised undertakers within the proposed district will naturally wish to know how the proposals of the Commissioners will affect them, and may bring forward a scheme which will propose the formation of a joint electricity authority with the proposers as the undertaker members. It would not be surprising to hear that such a scheme has already been put before the Commissioners in some form, though this is only guesswork.

But two things may be kept in mind. The first is that if a joint electricity authority is set up, that authority becomes an authorised undertaker for the whole of the district not covered by the areas of supply of existing undertakers, and is under the general obligation of an authorised undertaker to give supplies in the area. This obligation is not unlimited, but may be made mandatory by the Commissioners in respect of any area. It is, therefore, distinctly onerous.

The other is that the Commissioners may not accept any scheme submitted to them, but may amend it or formulate one of their own, and give effect to the amended or substituted scheme. These facts may have a considerable bearing upon the future of existing undertakings. The authorised undertakings in the district are somewhat scattered. Some of them are quite isolated, surrounded by rural territory outside their areas of supply, which does not tempt them to obtain extended powers. The extended power to use overhead lines, and the power of the Commissioners to make orders having the effect of provisional orders, may modify the conditions. What steps can they take to safeguard their interests? Circumstances differ so much in different cases that it would be foolish to offer any general advice. The owners of each undertaking should consider whether the organisation of the supply throughout the district is likely to benefit them, or whether they have anything to fear from it, and shape their course accordingly. The 1919 Act is not very difficult to understand, and a careful perusal of it will reveal the powers, duties, and responsibilities of the authority with reference to individual undertakings.

As before stated, it is known that some of the most important undertakings have conferred, with a view to co-operation in establishing a joint authority, and it may be expected that such a scheme will be put forward with Bristol in the forefront. Any authorised undertakers may, jointly or separately, propose schemes. Whilst other bodies than authorised undertakers may submit schemes, it does not seem likely that any such will propose schemes for this particular district.

The point is that no undertaker can be sure of being left outside the operations of a joint authority by merely refraining from acting with others in preparing a scheme. If such an authority is set up, every undertaking in the district will become subject to its supervision, and at the same time have a right to such benefits as the authority may be able to dispense.

There is, however, nothing to prevent any authorised undertaker from submitting a scheme for the improvement of the supply in its own vicinity.

If all the authorised undertakers in the district can agree upon a scheme in which their separate interests will be equitably treated, and the supply organisation demonstrably improved, the Commissioners will have to give such an agreed scheme very serious consideration. Naturally, in such an event, they will examine it rather closely from the public point of view, but the fact of unanimity will be a strong point. If discussion between the undertakers leaves some of them dissatisfied with the arrangement favoured by the majority, the dissentients will at least have the advantage of knowing what case they will have to meet at the local inquiry, and be prepared to set out their own objections and proposals for amendment.

Some of the undertakers, especially those who are most isolated, may fail to see any advantages to themselves from the operations of a Joint Authority. It appears to be open to them to submit schemes for local improvements, including the extensions of their own areas of supply. The powers given by the Act for the use of overhead lines and the compulsory acquisition of wayleaves may in some cases make this course quite attractive. But the Commissioners cannot grant them an extension of tenure, the one thing needful for small companies.

Another course open to any undertaker is to ask that the proposed area of the district may be altered by excluding the undertaker's area of supply. This can be done by submitting an objection or representation to the delimitation notice under Section 5, Sub-section (1), or the point can be raised at the local inquiry to be held under Sub-sec. (2). The prudent course is to submit an objection. The success of such an objection seems to be the only way in which an undertaking preferring to be left alone can attain that object. But success does not seem very likely, unless it can be shown that the isolation desired will enable the said undertaking to serve the public better than when working under a joint authority. The Commissioners may be expected to examine such a proposition very critically.

It must be remembered that the Commissioners may approve one of the schemes submitted with or without modification, or if no scheme submitted is approved, the Commissioners may themselves formulate such a scheme. Also that the scheme approved does not necessarily include the formation of a joint authority. But as the Commissioners have formally stated that it appears to them that the existing organisation for the supply should be

Digitized by Google

improved, it is extremely unlikely that things will be left in *statu quo*. That would be an admission by the Commissioners that what they have said should be done, cannot be done.

Under the Act of 1919 no generating station or other property of an authorised undertaker can be acquired by a joint electricity authority without the consent of the owner. But the amending Bill of this Session proposes to empower the Commissioners to establish either a joint electricity authority or a District Electricity Board in any district. A District Electricity Board will take over all the generating stations in the district by compulsory purchase on the terms which were so strongly opposed in the discussions on the 1919 Bill. The opposition last session, and the pressure of time, led to the Government withdrawing these provisions. The 1920 Bill seeks to restore them, with the very important addition that the compulsory purchase powers may (but not shall) be conferred on joint electricity authorities, as well as district electricity boards.

Whether the Commissioners will be in possession of these additional powers when they come to approve or formulate a scheme for the Lower Severn district, cannot yet be said. The Bill has not yet passed its second reading in the House of Commons, a good deal of opposition has been organised, largely on the Government side of the House, and the Irish Bill will block the way for some weeks.

But as the local inquiry will take place after July 31st—one would say in September at the earliest—the fate of the Bill will be decided before the Commissioners have to approve or formulate a scheme. It is not uncharitable to suppose that this fact had something to do with the fixing of the date. It is, however, rather embarrassing for the undertakers who do not know whether the Commissioners will, or will not, have the power to make a scheme with compulsory purchasing powers. It may conceivably make all the difference to their attitude towards any scheme which may be discussed among themselves.

There is this to be said about it. If the authorised undertakers, or a substantial majority of them, can agree upon a scheme which is calculated to meet the public requirements without the introduction of compulsory purchase powers, there seems no particular reason why the Commissioners should put in those powers, supposing that the present Bill has been passed. And if any undertaker considers that it would be to his advantage to transfer a part, or the whole, of his undertaking to the Joint Authority, the scheme may include provision for such transfer on agreed terms.

The weak point of the 1919 Act is that there is no provision for financing Joint Electricity Authorities. Whilst the Act contemplates that these bodies may purchase land, generating stations, and whole undertakings, and prescribes that the consent of the Electricity Commissioners shall be obtained to any proposed capital expenditure, there is not a word showing how the authorities are to raise the necessary capital. It is true that the scheme setting up an authority "may contain any consequential, incidental, and supplemental provisions which appear to be expedient or proper for the purpose of the scheme," and perhaps borrowing and other financial powers may be held to be covered by the words quoted. Also the scheme may provide for the exercise by the Joint Authority "of all or any of the powers of the authorised undertakers within the electricity district," which certainly seems to cover borrowing and other financial powers, including the borrowing powers of municipal undertakings on the security of the rates.

It seems, therefore, that any scheme approved or formulated by the Commissioners must incorporate provisions for financing the authority, with sufficient elasticity to allow for future development. This part of the scheme will not be the easiest to arrange.

To revert to procedure. When the Electricity Commissioners have approved or formulated a scheme, they are to publish it, and to hold a public inquiry on it. After that, they make an order giving effect to the scheme, possibly with modifications resulting from the last-named inquiry, present it to the Ministry of Transport, which may confirm the order, with or without modifications. The order has then to be laid before each House of Parliament, and is not to come into operation until it has been approved—with or without modification—by a resolution passed by each House. With these approvals the order giving effect to the scheme will have the validity of an Act of Parliament. It may be altered at any future date by an order which has passed through the same procedure.

It may be useful to recapitulate the steps of this procedure :—

1. Notice of provisional delimitation of electricity district by the Commissioners.

Objections or representations regarding the inclusion or exclusion of any area in the proposed district may be submitted, and if such are submitted the Commissioners have to hold a Local Inquiry No. 1.

2. Notice that it appears to the Commissioners that the organisation of supply in the district should be improved, and inviting authorised undertakers and certain other bodies to submit schemes for its improvement within a definite time.

The Commissioners have to hold a Local Inquiry No. 2 into this matter. At this inquiry questions of the inclusion or exclusion of any area in the district may be raised, whether Local Inquiry No. 1 has been held, or not, and it is only after No. 2 inquiry that the area is to be finally determined.

The Commissioners evidently consider that these two notices may be issued simultaneously.

3. Publication by the Commissioners of any scheme which they may have approved or formulated, and the holding of Local Inquiry No. 3 thereon.

4. Presentation by the Commissioners of an order giving effect to the scheme decided on as the result of Inquiry No. 3 to the Ministry of Transport.

5. Confirmation, with or without modification, of an order so presented, by the Ministry of Transport.

6. Approval by each House of Parliament by a resolution of an order so confirmed, with or without modification.

There will be opportunities for parties interested to present their case :—

1. As to the inclusion or exclusion of any area, by objection or representation, at Local Inquiry No. 1 ; and at Local Inquiry No. 2.

2. As to schemes for the improvement of supply, by the submission of such schemes, at Local Inquiry No. 2, and at Local Inquiry No. 3.

3. Generally by representations to the Ministry of Transport with respect to an order giving effect to any scheme, before the Ministry confirm it.

4. Generally, in discussion in Parliament on the resolution to confirm any order, if they can find a member of either or both Houses to put forward their views.

The Commissioners and the Ministry of Transport may make rules in relation to the various inquiries and other proceedings above summarised. Until these rules—which have to be laid before Parliament—have been made, nothing more definite can be said as to how action is to be taken under headings 1, 2 and 3. As to No. 4, there are no rules, but there are manners.

The Electrical Resistivity of Iron.—At the annual meeting of the Iron and Steel Institute, Mr. A. L. Norbury discussed the effect of various elements on the electrical resistivity of iron, and gave a *résumé* of the most important papers on the subject, up to and including that of Benedicks in 1902. He showed that Benedicks's method of plotting the resistivity values of quenched carbon steels on a straight line, and extrapolating to 7·6 microhms as the resistivity of pure iron, could not be considered correct. Recent determinations gave 9·9 microhms per centimetre cube as the resistivity of pure iron at 20°. The results obtained by recent investigators showed that equi-atomic quantities of different elements dissolved in iron did not increase the electrical resistivity to exactly the same amount. A new factor depending on the electronic properties of the particular element in solution determined the atomic resistivity increase in each case. The problem of calculating the electrical resistivity of a steel from its chemical composition was briefly discussed.

In a paper by Prof. C. A. Edwards and Mr. A. L. Norbury on the effect of heat treatment on electrical resistivity, it was stated that in the annealed condition the effect of chromium was to raise the resistivity of iron by 3·75 microhms for each 1·0 per cent. in excess of 4·3 times the carbon content. It appeared that the effect of chromium upon the resistivity of iron was to cause an increase of about 5·1 microhms per cubic centimetre for 1·0 per cent. held in solid solution.

THE ELECTRIC PROPULSION OF SHIPS.

By R. J. BUTLER, M.I.N.A.

(*Abstract of paper read before the* Greenock Association of Engineers and Shipbuilders.)

It is the purpose of this paper to consider some aspects of what appears to the author to be the logical outcome of the geared turbine for ship propulsion, namely, the substitution for the mechanical means of speed reduction of a method which shall be more in keeping with developments in the transmission of power in other industries, *i.e.*, an electrical one. In putting forward a proposition, no matter how great the technical merits of the scheme may be, it is necessary to offer the prospective buyer either a cheaper price or to produce indisputable evidence that an extra outlay will be more than recouped in a short period; and that definite advantages result from this increased initial expenditure. To the shipowner the cost per ton-mile of goods carried is the criterion by which his machinery is judged, always, of course, assuming reliability of the equipment.

In the original paper a list of the electrically-propelled vessels so far completed is given, besides which there have been six other installations completed, including three 3,000-h.p. set by Japanese firms, some smaller repeat vessels for Swedish owners, and some 40 vessels aggregating about 70,000 h.p., are under construction, principally for Scandinavian owners; all these sets are equipped with Ljungstrom type generators. It must be conceded that there is another side to the picture, and the principal objections levelled against the system are:—

1. Additional first cost. It may be stated broadly that the average increase of cost over, say, double mechanical reduction turbines should not exceed 20-25 per cent. for a tramp steamer of moderate size and diminishes with an increase of power.

2. Difficulties of cooling the generators and motors. This is a serious problem, as 5 to 6 per cent. of the total energy through the machines is dissipated in heat, but can be much assisted by intelligent grappling with the ventilation system. Sir Charles Parsons employed water to cool the rotors of generators some years ago, with very successful results. For marine propulsion the provision of cooling water to the stator also appears to be a very desirable object, and Mr. J. Shepherd has shown how this can be arranged.* Practically the whole of the heat so generated can be returned to the boiler. Further, the system would practically eliminate fire risks; at present a flash over is fed by the forced draught of the cooling air. It is realised that very careful construction would be necessary to obviate damage to the electrical parts by water leakage, but the system appears feasible, and, moreover, prevents deterioration and other troubles from salt air, which is extremely destructive when moist and warm.

3. Speed regulation and drop in motor efficiency. This cannot be strictly alleged as a disadvantage, and will be touched upon later.

4. The effect of helm on propelling motors running at synchronous speeds. In a twin screw vessel, when the helm is put over, the revolutions of one of the propellers show a large drop, depending on the direction of turning or, in other words, to keep up the revolutions requires a large increase of power. In the case of A.C. motors running at approximately synchronous speed, the effect of this is equivalent to an increase of propeller torque, and the motors must be designed to meet this virtual overload. Moreover, when going astern, full motor torque will be available, seeing that the synchronous speed will be maintained or nearly so. At the same time, induction motors could not lose their speed to the same extent as a steam turbine, without falling out, but trial results on the point are, as far as I know, not yet published. As an offset to this, if the load be removed, for example, by shedding a blade or breaking a shaft, the motor will not race.

5. The loss involved in transmission due to the inherent principle of converting mechanical into electrical energy and then back again to mechanical. Whilst it may be conceded that the loss is to some extent greater than with straight mechanical transmission, yet the disparity is very small, and is more than balanced by the advantages obtained. The average figure taken for single reduction gear loss is 2 per cent., and it has been common practice to assume 4 to 5 per cent. for double reduction gearing. This figure is, probably, too low, particularly at fractional loads. Some experiments carried out by the G.E. Co. of America showed an efficiency of 94½ per cent. for double reduction gearing, and a figure of 93 per cent. is attainable with the electric drive if properly designed. Bearing in mind that a considerable gain accrues from not having to drive an astern turbine whilst running ahead, 1½-2 per cent. should be about the difference involved. Further, mechanical gearing can hardly be expected to maintain its prime efficiency over a number of years of working.

It appears that the greatest scope for the system is in large vessels of the battleship and cruiser type where economy is vital at reduced powers and speeds and where the military and strategic aspects of the installation are unequalled by any other. Also in the case of high-powered mercantile vessels the system offers advantages in weight and space occupied. The case of small steamers of the tramp type is not so attractive, although the steam and fuel consumption of vessels tried out is certainly excellent. In the case of the *Wulsty Castle*,* the results of three long voyages come out at 1.05 lb. of coal of poor quality per I.H.P.-hour for all propelling purposes, which is some 9-10 tons better per day than a reciprocater of the same size. This, together with the increased cargo capacity attainable by placing the motors aft, the most prominent feature.

One of the objections urged against electrical driving is that it involves the carrying of skilled electrical as well as steam engineers. All engineers, if worthy of the name, have at least a smattering of electrical knowledge, and provided the gear be made of the simplest character and as fool proof as possible, and of the same general nature as is already found on ships, it is submitted that this argument does not carry a great deal of weight.

As regards reversibility, the writer himself saw the ease with which this was done on the *Wulsty Castle*, the average time being 7 seconds ahead to astern, whilst the *New Mexico*† is stated to take from 7 to 9 seconds for the same operation. The turbines can also be started from cold in about 12 minutes, a vast difference from the old lengthy period of warming up.

D.C. is neither technically nor commercially a sound proposition for any but the smallest installations. The limitation of pressure means that very high current densities must be carried, and the size of the cables, commutators, brush gear, and windings becomes so large as to make the expense prohibitive. Moreover, large commutators and brush gear limit again the speed of the prime movers, so that, unless mechanical gearing is introduced, the turbine speed necessary is not the most economical one, and the turbine is itself of increased size, due to the restricted rate of revolution. With large commutators, moreover, a flash over might possibly stop the ship. These considerations, together with the heavy upkeep of commutators and brushes, have ruled out the D.C. machine for all but submarines, where current is supplied from storage batteries. All other installations have employed A.C. to date.

The main turbo generators will not differ largely from land practice, until the advent of water cooling mentioned earlier; they are usually of the 3-phase bipolar type with, in small machines, an integral type exciter, and in large sets with separate source of supply for this purpose. The number of turbines should, in any case, be two, and in all installations so far no stand-by generator has been provided, but both generators operate in parallel. In the case of the *New Mexico* the machines are of two phase design, but this is the only example of the type I am aware of. The voltage at which the machines work is partially determined by the method of driving auxiliaries, but in practice the pressure has been increasing up to 4,242 volts in the *New Mexico*; 3,000 volts would appear to be the most suitable figure, giving moderate size cables, but there seems to be no reason why, in the future on large vessels, pressures of 6,600 volts or even higher should not be employed.

The turbines should be arranged for as high a superheat as is possible without unduly affecting the economy of the steam generators, so as to take every advantage of the absence of an astern turbine, and it is in this respect that the Ljungstrom type with its known capability of standing any practicable temperature without distortion is so satisfactory, irrespective of its high economy.

The vacuum should be as high as is obtainable compatible with the sea temperature conditions of the waters traded in and provided that the power expended in obtaining it does not neutralise the gain in efficiency.

In designing both the generators and motors, it must be borne in mind that a large overload torque is necessary to pull up the ship when going full ahead and then suddenly reversed. In the case of the *New Mexico*, this condition was met by temporary over-excitation of the generator fields, a booster being put in for this purpose. As this overload only occurs for a very short period, and is automatically cut out, there is no danger of overheating, and the generators can be designed for normal load, if provision for this condition is made. The main motors can be either of the squirrel cage or slip ring type.

If motors of the squirrel cage type are desired, the rotor conductors must be specially arranged so as to provide the characteristic of starting on load, which the ordinary squirrel-cage motor will not do. In the *New Mexico* the rotors are provided with inner and outer conductors, one of high

resistance and one of low resistance with a deep air gap between the windings; this, however, is the only modern example of this method. The advantages thereof are so great, viz., it eliminates the necessity of fitting liquid resistance in the circuit, that it is thought the scheme will be more generally adopted. In the case of other vessels, the slip-ring type of motor is used with liquid variable resistances in the circuit for providing the necessary starting torque. If two economical speeds are required double windings on the motors will be provided, but this should only be necessary in the case of battleships, and will not, of course, be required in the case of mechant steamers running at constant speed, for which the motors can be wound of the ordinary induction type. In some cases of high power and low propeller revolutions, it may be necessary to insert a helical gear reduction between the motors and the shaft, but this should be avoided if at all possible.

Speed regulation is at present accomplished by: (*a*) Changing the speed of the turbine, *i.e.*, altering the periodicity and voltage. (*b*) Insertion of resistances. (*c*) Change of voltage without change of generator speed. (*a*) and (*b*) are the usual methods in modern ships, and can be done readily on all A.C. installations. In ordinary land practice, the revolutions are maintained constant with change of load and steam consumptions of turbo-alternators are given by makers at full and fractional loads with the speed constant. This condition does not apply at sea, the revolutions being a function of the ship's speed required to overcome the resistance to movement through the water. Information concerning alternator and motor efficiency under these conditions is practically impossible to obtain. In this connection, when the *New Mexico* was built a propeller model was made and the torque and speed plotted; the motors were then designed from the information so obtained, one of the figures obtained being the overload torque on rapid reversal already discussed. In most cases, it is to be presumed, the motors have been made of amply large size, without elaborate investigation, and the appearance of existing sets goes to confirm this supposition.

Much yet remains to be done in the evolution of the control gear suitable for use on shipboard, where the conditions are so very different from those obtaining in power stations. Great care in the design and fitting up of all switchgear, instruments, &c., must be exercised to exclude wet salt air, and sometimes coal dust. The provision for running cables where out of reach, but readily accessible for examination, must be very carefully considered, and they should be placed in positions where there is no danger of flooding; particularly should they be kept out of bilges.

The Diesel engine is now rapidly overcoming prejudice and gaining the confidence of shipowners, and for reasonably low powers, say, up to 3,000 B.H.P., is a powerful rival to the steam equipment.

The disadvantages of the lack of experience of builders leading to breakdown at sea; the weight of machinery per B.H.P. developed, and the comparatively high price of the equipment compared with steam plant, are being steadily reduced, and the day appears not far distant when the two systems will have drawn level on all three scores.

The average consumption of ½ lb. of oil per B.H.P.-hr. cannot be approached by steam, although the consumption of lubricating oil to some extent offsets the saving in running costs. With direct-connected Diesel engines, where the speed of rotation is moderately low, say, 125 for 1,000 B.H.P., the weight heretofore has been excessive, and should higher speeds be adopted with a view to cutting weight and price, a diminished propeller efficiency results. Mechanical gear has been fitted in one or two recent American vessels, with apparently successful results, but the insertion of an electrical reduction appears preferable, in that it abolishes the great bugbear of starting and reversing the Diesel engine. The maximum speed of, say, 500 R.P.M., corresponding to highest submarine practice, is eminently suitable for D.C. generation so that in this respect D.C. generators and Diesel engines approach their maximum suitable power and speed together. It is doubtful, however, if this fast-running type will ever prove to have the necessary reliability, which it must have in the rough and tumble of commercial work; submarine engines being notoriously of a kind that require much nursing and tuning up.

It will be seen, then, that the Diesel electric combination drive has not the attractions of a turbo-electric drive, where both turbine and alternator essentially need high speed for operating at maximum efficiency. It should be added that no electrical difficulty should arise, except that overload conditions cannot be met so readily as in the turbo-driven plant, especially when the boilers are oil fired.

Turning now to a consideration of the auxiliary machinery, an enormous saving of fuel consumption results from the ability to drive these electrically, at a cost of, say, 15 lb. of steam per H.P.-hr. (including all losses), against some 40 lb. (a very conservative figure) for the direct steam-driven machines. It will be noted that the source of supply of exhaust steam for feed heating is removed, but as shown above, either the water-cooled alternators themselves can be arranged as feed heaters, or if cooling air is adhered to, a supply of low-pressure steam can be bled from the turbines at a stage where the pressure is appropriate. The absence of auxiliary steam and exhaust pipes, with their accompanying radiation losses, is a source of further economy, and relieves space congestion.

It has always appeared remarkable that the electric driving of auxiliaries in ordinary vessels, with an internal combustion engine generator, has not appealed to superintending engineers as a fuel-saving proposition of high merit. It remains to be discussed whether the auxiliary plant motors should be D.C. or A.C., and at what voltage. These are questions which must be dealt with on the merits of each specific case. In the first place, in a small vessel, where the percentage of auxiliary power to propelling power is high, the demand for energy in harbour will be the determining factor, and it would probably pay to run one of the main generators (there should never be less than two installed) at reduced load, rather than fit a separate unit for auxiliary purposes.

In larger ships where the power required for auxiliary purposes is fairly considerable, but a small percentage of that of one of the main generators, it would pay to install one or more machines solely for this purpose, and if the auxiliaries are to be run with D.C. motors, these supplementary sets may be arranged to excite the main fields also, with, of course, provision for regulating independently.

In any case, we are confronted with fitting the auxiliary motors to take a supply either: (*a*) A.C. direct at voltage of the main or auxiliary generator. (*b*) A.C. at reduced voltage through static transformers, either from main or auxiliary sets. (*c*) D.C. at reduced voltage through a motor converter, either from main or auxiliary sets. (*d*) D.C. at any desired voltage direct from separate D.C. machines.

(*a*) Unless the propelling power is very small, the generator voltage will not be sufficiently low to enable it to be used on the corresponding small A.C. motors direct. Moreover, high-voltage A.C. motors of small H.P. are difficult to build and maintain, have not very flexible characteristics, nor in the case of a breakdown can they be readily repaired or replaced from stock, unless the voltage and periodicity are the standard of the country in which the ship happens to be. This system is fitted in the *Wulsty Castle*, but has little except simplicity to recommend it; in this case the voltage is 650 and periodicity 60, which voltage is not a standard in any country.

(*b*) This is a more satisfactory method. The periodicity question still holds here, and in both cases (*a*) and (*b*) when annual survey is being carried out and all steam raising plant is out of operation, it is very unlikely that the shore supply would be of the same voltage and frequency as that provided on board.

The control of small motors, *e.g.*, for air and circulating pumps, where flexibility is such a desideratum, is not so readily effected with A.C. motors, so that whilst (*b*) is superior to method (*a*), (*c*) appeals to me as readily meeting all the conditions. As far as is known the system is not yet fitted in any ship, and it suffers from the introduction of another moving link in the chain, and whilst the efficiency of the converter is not so high, nor is it so cheap as the static transformer, yet seeing that the auxiliary current will usually be some 6-8 per cent. of the main, the loss of economy will not be serious, and there are very great advantages to be derived from its employment.

Method (*d*) is that fitted in the American battleships, and fulfils the same requirements as (*c*). Two 300-KW. sets of which 60 KW. are used for exciting, are fitted, and their exhaust is led either to the feed heater or main turbines.

So far as weight and fuel consumption are concerned, there appears on paper very little to choose between the rival electric and mechanical double reduction gears, but reliable consumption data for the double reduction gear drive are not yet to hand, and such figures as have been quoted certainly do not bear out the glowing estimates which have been made.

In the opinion of the writer, the system of electrically-propelling ships has come to stay, particularly for large high-powered vessels. The Scandinavian nations and the U.S.A. are going ahead vigorously. Unfortunately the war dislocated all the British plans, but a revival should appear in the near future.

National Health Insurance.—The Ministry of Health makes the following announcement:—

The National Health Insurance Bill, which has just received the Royal Assent, makes important changes in the benefits and contributions under the National Health Insurance Scheme, to operate from July 5th next.

The object of the changes is to provide for an increase in the rates of benefit in view of the fall in the value of money. The normal rate of sickness benefit will be raised from 10s. to 15s. a week in the case of men, and from 7s. 6d. to 12s. in the case of women; disablement benefit will be raised from 5s. a week to 7s. 6d. for both men and women; and the amount of maternity benefit will be raised from 30s. to 40s.

In order to provide for the increase of benefits, the joint weekly contribution is to be increased from 7d. to 10d. in the case of men, and from 6d. to 9d. in the case of women, of which the employer's portion will normally be 5d. in each case. In certain cases where low wages are paid the employer will pay a larger, and the worker a smaller, portion of the joint contribution. The contribution cards from the week beginning July 5th next must in all cases be stamped at the rate of 10d. a week for men and 9d. for women; stamps of these values will be on sale at post offices.

A NEW TYPE OF SHIPYARD CRANE.

By W. HOK.

(*Abstract of paper read before the* Institution of Engineers and Shipbuilders in Scotland.)

Some eight years ago it was decided by the Lindholmen Shipbuilding and Engineering Co., of Gothenburg, to lay down three new berths for the construction of ships up to 12,000 tons deadweight. It became imperative to decide what kind of hoisting appliances should be adopted for the new berths, and in 1913 I set out to visit about 40 shipyards. I found that a large number of very efficient yards adhered to the ordinary mast and derrick arrangement. Invariably the hoisting winch, whether steam or electric, common to two or more derricks, was placed on the ground level, with the attendant trouble of having the hoisting rope leading from the winch to the derrick mast always entangled in bars and plates, staging uprights, and all sorts of rubbish. Besides, signal men placed here and there were part of this equipment, as the winch operator could not as a rule see what he was doing. Other yards were equipped with all kinds of expensive overhead travelling cranes, cantilever cranes, and revolving cranes.

Nobody seemed entirely satisfied with the crane arrangements he possessed. On the whole the tendency was to discard very expensive crane sheds, covered in or not, and to substitute cheaper arrangements.

I came to the following broad conclusions:—

1. The mast and derrick arrangement is quite satisfactory, provided it can be so arranged that all side staying of masts can be done away with.

2. The operator's platform should be placed high up above the ground so that the operator can see what he is doing, thus obviating the necessity of using signal men.

3. The lead from the hoisting winch to the derrick mast should be free from all obstructions.

4. A space or passage-way is desirable between contiguous ships to enable building material to be brought down between

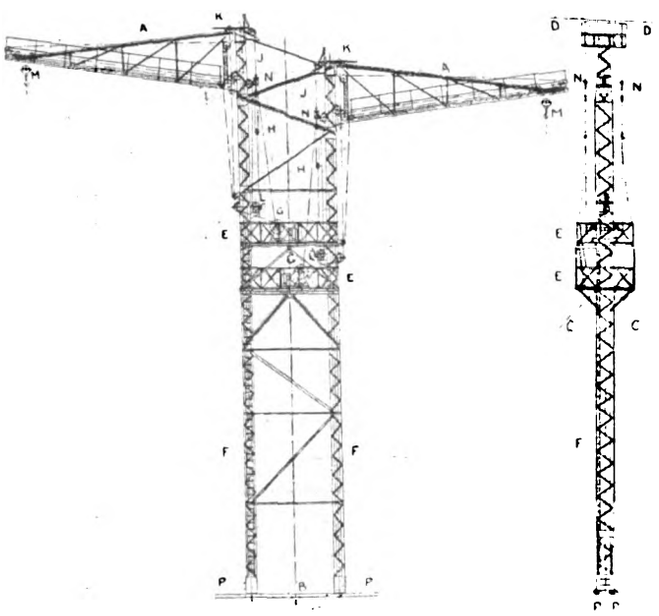

Fig. 1.—Side and End Elevations of the Hok Shipyard Crane.

ships and hoisted on board from the nearest point at the ship's side, and not from the ship's end only.

Guided by the leading features just mentioned, I designed the stationary building-berth crane here illustrated, eight of which are erected at the Lindholmen Works, and have been in good use since 1914.

It will be seen that the new type of berth crane is chiefly composed of a stationary main structure and two swinging arms, the former consisting of two lattice-work masts placed about 15 ft. 3 in. apart from centre to centre, and rigidly connected to one another by cross stays and trusses, making the main structure stable in the thwartship direction, thus obviating the necessity of fitting the objectionable side-stays which are an inevitable essential of the ordinary mast and derrick arrangement.

Each derrick frame carries two derricks or arms A, fig. 1, as shown, which can swing about 120 degrees to each side of a vertical thwartship plane through the derrick frame, *i.e.*, well past the centre line of railway B, laid down in the passage-way between contiguous ships. The derrick frame is held in place by fore and aft wire stays only, as shown in figs. 1 and 2, *i.e.*, by two sets of stays, the lower ones C being fitted, partly for giving rigidity to the frames in a fore and aft direction, partly for preventing collapse of a whole group of interconnected cranes in case for some reason the top end stays R, fig. 2, or some of the top stays D, figs. 1 and 2, fitted from crane top to crane top of that group should give way.

At a suitable place above the ground two operators' or winch platforms E, are built into the derrick frame, one above the other, access to which is obtained by ladders inside the frame legs F.

Each crane arm and the load are in the present case controlled from their appropriate platform E by a single ordinary A.C. electric shipyard-winch G, that is to say, controlled by one electric motor only. Hoisting and lowering are done with the winch centre barrel in the ordinary way, and slewing with the extended winch ends by taking a couple of turns round the appropriate extended winch end with the loose end of a tackle H, actuating the wire J which is carried round and fastened to the rim of the horizontal wheel K on top of the crane. The wheel is fixed to the top centre pin of the crane arm.

A spiral spring N is introduced above the slewing tackle for the purpose of taking up the inertia of the crane arm when it arrives at the extreme end of the swing, in this way preventing damage and unnecessary straining of the connections in case of rough usage or ignorance on the part of the man handling the crane; for the crane is so easy to manipulate that any ordinary platers' helper or labourer can officiate.

Racking is done with a small hand winch L. It will be noticed that the lower member of the arm along which the trolley moves is not horizontal, but slightly sloping. It is in this case purposely so arranged in order to make it comparatively easy to move the trolley towards the outer point of the arm, when there is no weight on the crane hook, and to make it very easy to move the trolley towards the derrick frame when the load is on; and for these reasons the trolley M is always moved, before the weight is on, as far out towards the extreme end of the arm as considered necessary in each individual case, after which it is a very simple matter to adjust the trolley in the direction of the derrick frame, if necessary, after the load is on. In practice this method has shown itself to be satisfactory and quite sufficient. If it should be preferred to manipulate the crane with three motors, one for hoisting, one for slewing, and one for racking (the member on which the trolley travels being in that case horizontal); it can, of course, be easily done.

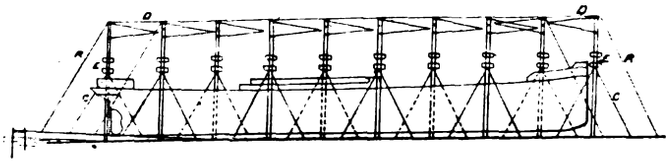

Fig. 2.—Berth Equipped with Cranes.

The frame legs stand on joists P, laid thwartship, and about 3 ft. apart—*i.e.*, the fore and aft dimension of the frame legs apart. These two joists are securely fixed to the solid rock, and the frame legs are securely bolted to the upper flanges of the joists. In this way is the transverse stability of the crane doubly secured.

The present cranes were built flat on the ground. When the arms had been fitted on to the frames and secured, the cranes were raised into a vertical position, and then screw-jacked into their absolute position. The frames have a height above the ground of 110 ft.; the section of each frame leg is 22 in. wide and 36 in. in a fore and aft direction. The crane arms are about 40 ft. long; the upper winch platform is about 60 ft. above the ground, the lower platform about 8 ft. below the upper one, and the height from the ground to the underside of crane hook in its highest position is about 90 ft. Ball bearings are fitted throughout. The clear distance between the frame legs is 13 ft. 6 in., thus admitting one or perhaps even two parallel railways between the frame legs and between contiguous ships. With these cranes 22 ft. only are required between contiguous hulls.

They were built to lift 2½ tons at the extreme end of the arm, but it was found that with a slight strengthening they could be made to lift 5 tons at the extreme end of the arm and 10 tons at about 10 ft. from the derrick frame.

One or both groups of cranes surrounding a ship can be shifted sideways without great difficulty.

Each crane, including one complete frame and two arms, but excluding winches and hoisting wire, weighs about 33 tons. These cranes are cheaper than any other existing hoisting appliance with the exception of the ordinary mast and derrick arrangement.

THE BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION'S DINNER.

ON Thursday last week the annual dinner of the Association was held at the Savoy Hotel. The Right Hon. Lord Ampthill, G.C.S.I., President of the Association, was in the chair, and there was a very large attendance, some 400 members and guests being present. Amongst the guests were Sir J. Fortescue Flannery, M.P., Mr. George Balfour, M.P., Sir John Wormald, C.B.E., Mr. C. Hamilton Wickes, C.B.E., Lord Carmichael, G.C.S.I., Sir John Snell, Lord Vaux of Harrowden, Engineer Vice-Admiral Sir George Goodwin, K.C.B., Rear-Admiral F. L. Field, C.B., Lord Ashfield, Lieut.-Col. Sir J. Dunlop Smith, K.C.S.I., Lord Sydenham, G.C.S.I., Mr. Andrew Fisher, Sir John A. Aspinall, Mr. James Swinburne, F.R.S., Mr. Roger T. Smith, President I.E.E., Sir Allan Smith, K.B.E., M.P., Sir Richard Redmayne, K.C.B., Sir J. E. Petavel, K.B.E., Sir Philip Nash, K.C.M.G., Sir William Clark, K.C.S.I., Mr. W. W. Lackie, Sir Harry Haward, Mr. C. H. Wordingham, C.B.E., Sir Frank H. Heath, K.C.B., Mr. G. Scott Ram, Mr. Archibald Page, Mr. C. Le Maistre, C.B.E., Mr. P. F. Rowell, Mr. Summers Hunter, C.B.E., Lieut.-Col. Mervyn O'Gorman, Mr. Michael Longridge, C.B.E., Mr. S. L. Pearce, C.B.E., Sir Thomas Robinson, C.B.E., M.P., and many other well-known engineers and leaders of industry.

Proposing "The King," the CHAIRMAN described him as the keystone of the arch of the constitution, and the bond of Empire, and eulogised his high qualities; he also drew attention, when introducing the following toast, to the splendid work of the Prince of Wales.

SIR JOHN SNELL proposed "The Industry," remarking that since 1916 no fewer than seven departmental committees had been appointed, on six of which he had served. The Electrical Trades Committee under Sir Charles Parsons showed that electricity was a key industry; combination at home was essential to successful competition abroad. The Electricity Supply Committee gave rise to the Electricity Supply Act, which was regarded on all hands as the great charter of electricity. The Coal Conservation and Water-Power Resources Committees showed how the national stores of energy could be better utilised, and the Committee on Electroculture had shown that an increased yield of 30 to 40 per cent. of grain and straw was obtainable. These committees, together with those on Imperial Wireless Communication and the Electrification of Railways, covered the whole gamut of electrical enterprise, and their work would bring about an era of prosperity in the electrical world such as had never been dreamt of in the old days. The output of energy from British electricity works rose from 1,300,000,000 units in 1913 to 4,500,000,000 units in 1919; five years of war had shown what an essential necessity electricity supply was, and in the next five years the output would be more than doubled again. The accompanying increased output of plant would bring improved methods of manufacture and lower the costs, besides developing export trade, and he predicted in ten years an unimagined prosperity for the whole electrical industry. He was glad to see that the Association was promoting the cause of education and research; we should train our own water-power engineers, for if the designing was done at home the trade would be kept at home—as a rule work followed the engineer. He was grateful to the Government for the colleagues given him as Electricity Commissioners. So far they were an extremely harmonious and hard-working body. No one could realise the immense amount of work that had accumulated; they had to perform all the electrical duties of the L.G.B., Board of Trade, L.C.C., &c., and in addition they had to develop their new procedure, bring the electricity regulations up to date (they were rather behind the times), study the whole country, and divide it into districts, promote new legislation, and deal with an immense number of extensions of plant. They had got under way with some celerity—the first district was published two weeks ago, the next was about to issue—but the industry must be patient till they had overcome the accumulation of five years. They had no idea of sweeping away all the existing stations and substituting 16 new ones, as the lay Press had it; they would weed out the bad ones, improve others, and add large complementary ones as required to meet industrial needs.

Sir C. ELLIS (Vice-president), in his reply, emphasised the importance of education and the provision of scholarships.

Mr. W. L. HICHENS proposed "The Profession," describing consulting engineers as the watch-dogs who prevented undue inflation of prices, and thereby benefited the industry, for it was important to keep prices low in order to retain the export trade. The Research Committee of the Association, he said, was doing excellent work, but every business should do some research of its own, and that was the soundest argument in support of the big amalgamations that had been taking place. The industry should also support research work at the universities more generously. He paid a tribute of admiration to the work of Mr. A. P. M. Fleming and his committee, which had produced a report on engineering training which everyone ought to read. They needed also a research into the ultimate aims of industry. Was it to amass private riches, or to produce the maximum wealth for the benefit of the community, or was it to promote the glory of God and the advancement of humanity? The root cause of industrial unrest was that they had no common ideal; co-operation was essential to the country's progress, but how could they expect it without an ideal?

Mr. ROGER T. SMITH, President I.E.E., replied, and pointed out that the war made it clear that science and research were the mainsprings of electrical industry. Only production was required in addition. The industrial engineer and the consulting engineer were of equal merit; the Institution of Electrical Engineers had for many years ceased to be a professional institution, and sought to represent every section of the industry, none more than the manufacturers' section. Their association, in connection with the Department of Scientific and Industrial Research, was a most important step; the Association and the Institution were also jointly represented on the Committees of the British Engineering Standards Association, whose specifications were a form of "protection" to which no party could take exception, and ought to become national standards.

Mr. JAMES SWINBURNE also replied, putting in a strong plea on behalf of the salaried members of the industry. He accused the Government of blank ignorance of the fundamental principles of the currency problem; it first debased the currency to half its pre-war value, and then, when an engineer was paid at double the pre-war rate to compensate for this, it took away one-third of his income by taxation. People had little idea how badly off the unfortunate salaried man was; let those who were in control of salaries realise that the Bradbury was only worth half a sovereign, if as much as that.

The CHAIRMAN proposed "The Guests," remarking upon the happy relations which prevailed between the buyers and sellers at that table.

Rear-Admiral F. L. FIELD, in reply, said that nothing had increased so rapidly in the Navy in the last few years as electrical plant. The Navy was now to be reduced, but he maintained that the smaller it was, the more perfect the material must be, and they must spend more money on research than ever before.

Sir ALLAN SMITH also replied, remarking that as the industry had survived seven committees, he was confident in its ability to continue to prosper.

Mr. W. O. SMITH (Chairman of Council), proposing "The Chairman," said that the absence of Lord Ampthill on military service for five years had been a serious loss to the B.E.A.M.A., but during the war their membership had doubled.

The CHAIRMAN, in reply, expressed his pride in presiding over the Association, which was helping to "win the peace." National security depended on economic security, which involved the ability of the nation to provide for itself all essential commodities without dependence on any foreign nation. The electrical industry, the handmaid to all other industries, was a key industry—and the B.E.A.M.A. was going to see that that key remained in the hands of Britain.

During the evening the band of H.M. Scots Guards played a programme of music, and all the arrangements were admirably conceived and carried out. The gathering will rank as one of the most important social functions of the electrical industry.

REVIEWS.

Telephonic Transmission, Theoretical and Applied. By J. G. HILL, Assistant Staff Engineer, General Post Office, London. Pp. xvi+308, 196 diagrams. London: Longmans, Green & Co. Price 21s. net.

This volume on telephonic transmission is the first of a series of manuals on telegraph and telephone engineering edited by the late Engineer-in-Chief of the Post Office, and now in course of preparation. If those which are yet to appear are analogous to the present one in their general structure and method of treatment, we shall be provided with material which will be of immense service to all telegraph and telephone engineers in everything appertaining to the lines and apparatus with which they have to deal.

Following a plan which a number of recent writers of text books involving somewhat advanced mathematics have adopted, the author gives a preliminary chapter to a statement of the more important formulæ which are brought into use throughout the book. This chapter will be particularly helpful to the student by the clearness with which the structure of the various formulæ, particularly those of hyperbolic functions is arrived at, although it is to be feared that the reader whose knowledge is confined to algebra up to the theory of indices, and a knowledge of ordinary trigonometrical formulæ, will have some difficulty in recognising $e^{jx}=\cos x + j \sin x$ as de Moivre's theorem.

The succeeding thirteen chapters deal with the "infinite" line and equivalent circuit, the loading and design of cables (all from the direct current standpoint), the human voice in telephony, application of alternating currents to lines, reflection and power in telephone circuits, the constants of telephone circuits, the loading of circuits, measurements on transmission lines, the standard cable and its uses, cost problems in transmission, transmission formulæ for lines in

Digitized by Google

series with apparatus in series and in leak, and the thermionic valve as a telephone relay. It will thus be seen that Mr. Hill covers a wide field in his treatment of the subject.

The student, however, will find it necessary, before commencing a serious study of the transmission problems to thoroughly acquaint himself with the mathematical proofs given in the appendices at the end of the volume, having done which he will be in a position to follow the mathematical portions of the book. These portions are more or less restatements of the work done by the pioneers in the subject, along with their application, in illustrative examples, to present day problems.

In Chapter IX the author deals with the loading of telephone circuits comprising overhead, underground, and submarine lines, and the three types of loading, viz., continuous, series, and leak. Much useful information is given on this extremely important branch of telephonic transmission which has contributed so largely to the extension of the limits over which ordinary commercial speech was practicable. Not only has Mr. Hill dealt exhaustively with the advantages incidental to the several types of loading, but he also enumerates the disadvantages which may likewise be operative, *e.g.*, in the case of continuous loading, the limitations of the method are set forth seriatim. It would be interesting to know, in this connection, if the unequal ageing of the iron windings is still a possible objection to the method or whether it has been borne out by actual experience.

Chapter X is a particularly useful one, inasmuch as it is devoted to the measurement of impedance, and line constants; worked examples being freely interspersed in the text. A full description of the Franke machine, and its application to impedance measurements, is also given. An interesting account follows of the W.E. Co.'s cross-talk meter, and the method of using it in the estimation of cross talk from any disturbing source.

Not the least interesting chapter in the book is that dealing with cost problems in telephonic transmission, and here the author has not confined himself to purely academic statements or generalities. Starting from the electrical constants of some specific type of line, the equations of cost are built up, and curves are given which embody the results arrived at.

The final chapter is appropriately devoted to the latest development in the field of practical telephony, viz., the thermionic valve and its use as a telephone relay. Many attempts have been made since the telephone became a commercial success to introduce repeating devices, such as in the case of the telegraph, that would enable signals to be repeated at one or more points, and hence extend the limit to which it was possible to communicate; but all have proved more or less unsatisfactory. With the advent of the thermionic valve, however, new possibilities suggested themselves, and telephone engineers were not slow to avail themselves of the solution of a problem that had so long baffled them, which the valve offered them. Much good work has been done in the application of the valve amplifier as a telephone relay by the British Post Office; and although finality cannot be said to have been reached, even with Mr. Hill's anticipated 27 miles of standard cable improvement, we are nevertheless in possession of an agent which has given an entirely new trend to the efforts of those who are dealing with long distance telephony, and which in its revolutionary aspect, as regards existing means of communication, appears to be fraught with far-reaching consequences.

In seven appendices are given the mathematical proofs of the formulæ employed throughout, and an eighth appendix shows graphically the relation between x and e^{-x} from $x = 0$ to $x = 13.8$, and from $e^{-x} = 1$ to $e^{-x} = 1 \times 10^{-6}$ which will be found useful.

The book appears to be extremely free from typographical errors, but attention is drawn to page 166, fourth line from bottom, where "171 miles" should read "171 mils"; and on page 224, eleventh line from top, the final "d" of "designed" is inverted.

We expect that this volume will have a wide circulation, not only for its own intrinsic merits but because it is the production of one who has already done so much careful and extensive work in the field of telephonic transmission; and if the remaining volumes of the series promised by Messrs. Longmans are at all similar to the present one, in so far as letterpress and illustrations are concerned, little will have been left to be desired. A. F.

Guide to the Study of the Ionic Valve. By W. D. Owen, A.M.I.E.E. London: Sir Isaac Pitman & Sons. Pp. vii +58. Price 2s. 6d. net.

At a time when technical education is of such paramount importance, every new publication which will increase popular knowledge in the accomplishments of science has its value. During the war, the progress of wireless telegraphy was very rapid, and, owing to the conditions, the general public and the amateurs interested in wireless have had little opportunity of studying the new advances. The result is that there is now a general thirst for knowledge. That it helps to supply this knowledge to a slight extent appears to be the only excuse for the publication of this booklet.

The price of the book seems rather high for about fifty small pages of large type. There are fifteen chapters, each of them very elementary and discursive. The first contains the statement that "the assumption that electricity travels from positive to negative is incorrect." This sweeping assertion in capital letters is likely to give the elementary reader an unnecessarily rude shock, especially since no real explanation is given for the dramatic statement.

On page 11, after discussing the Fleming valve as a hot-to-cold electrode rectifier, the reader is directed to fig. 3. A plate battery, however, is shown in this figure, and the beginner for whom the book is written will undoubtedly wonder what object it serves. It is only later that rectification due to non-linear plate current variation is explained.

No mention is made of rectification at the saturation bend of the curve.

Referring to the use of a grid, the author states that "the additional electrode must be such as to have capacity with respect to the filament." As a matter of fact, the smaller the capacity of the grid the less will be the energy required to charge it to a given potential. It is an advantage to have the grid capacity as small as possible.

In chapter VII the author opens his remarks by an extraordinary demonstration of the principle of the valve as an amplifier. Two lines are drawn, one a steep one representing the straight portion of the grid voltage-plate current curve of a 3-electrode valve, and the other a straight line at 45 deg. representing Ohm's equation $C = E/R$. The explanation is that the valve "curve," being steeper, gives an amplifying effect. It is hoped that the reader will realise that the slope of the $C = E/R$ curve depends merely on the value of the R chosen. In any case, it is not possible to compare the result of Ohm's law with the effect of voltage in one circuit on current in another.

On page 39 the author tells his readers that the various types of tubes now used vary intentionally in degrees of vacuum. With the exception of admittedly soft valves, every attempt is made to exhaust valves to the highest possible degree in all cases.

The second half of the booklet contains practically no information, but is a hurried attempt to say *something* about each of the different applications of the valve. If published in 1917, the book might have been of some slight use, but now, when so much more complete information has been published in book form, there seems no need for a sketchy introduction to the subject.—John Scott Taggart.

Diesel Engine Design. By H. F. P. Purday. London: Constable & Co. Pp. xiii+301, 271 figs. 1919. Price 21s. net.

This book, based on 12 years' experience of Diesel engines, mainly from the drawing office point of view, presents an account of the main considerations which control the design of these engines.

The design of Diesel engines is now long past the rule-of-thumb stage; designers have agreed on many fundamental principles and general ideas of construction, and these same principles are not likely to be greatly changed. It is now possible to compute with accuracy the various stresses occurring in the component parts, and results can be foretold almost as closely as with the steam engine and turbine.

The progress made in the manufacture of Diesel engines can be seen from the fact that one foreign firm has built over 30 sets with an average indicated horse-power of 2,700, and is now building sets of engines up to 8,000 indicated horse-power, also one English firm is constructing four-cycle engines having an indicated horse-power of 6,600, which are proving a great success.

The first two chapters of the book deal with first principles and thermal efficiency. These provide a useful introduction to engine design and detail, and will be read with advantage by the student and engineering draughtsman.

Exhaust, suction and scavenge are dealt with very thoroughly, and the methods used in calculating areas are fully shown.

The principle of similitude, a very important subject when considering new types of engines, is dealt with in Chapter IV. The figures and tables given are based on a practical knowledge of modern engine design, and are very reliable.

Chapter V deals with crank shafts, and a considerable amount of space is devoted to the arrangement of cranks, order of firing, proportions of journals, twisting moments, and lubrication.

The design of fly wheels, and their application to Diesel engines, is fully considered, and a large number of examples are worked out

Framework, design of cylinders and cylinder covers, and running gear are all dealt with in a very able manner, and fully illustrated.

A description of the various fuel oil systems, both as regards the storage tanks and piping which are external to the engine, and the organs of the engine itself which are directly concerned with the delivery of the fuel to the working cylinder, is given and illustrated with useful line drawings.

Air and exhaust systems and valve gears are dealt with at the end of the book.

Mr. Purday's book is an extremely valuable and practical contribution to the literature on the Diesel engine; it is a pleasure to read, and can be strongly recommended to both students and designers for its completeness, conciseness, and

Digitized by Google

intelligent selection of examples and illustrations. The whole book points to a thorough practical knowledge of the subject. The reference to literature (authors and publishers) which is inserted at the end of each chapter is to be commended.

E. P.

THE ELECTRO-DEPOSITION OF IRON.

ALL users of machinery have been concerned on occasions at the necessity for scrapping important and valuable parts owing to a small portion having become worn. In high-speed machinery, such as aeroplanes and internal-combustion engines, and also in connection with guns, during the war, this became a serious problem, and considerable progress was made in developing the process of the electro-deposition of iron upon the worn parts. This not only had the effect of saving valuable parts from the scrap heap, but the saving in time and the greater speed in getting aeroplanes, guns, &c., back again into action, was of even greater importance. In commercial engineering of all kinds the process of electro-deposition of iron should find an important place, although, so far as we have been able to ascertain, the application of the process on a commercial scale is only being attempted to a small extent.

Yet quite a considerable amount of research has been carried out upon it, and much valuable practical experience was obtained in the Motor Transport and R.A.F. repair depôts in France, and also at Farnborough. The practical repair work by means of the process in the field was necessarily of a more or less unscientific nature viewed from the standpoint of the laboratory research worker, but the greatest possible credit is due to certain officers whose enthusiasm led to really wonderful results in the face of difficulties from both outside and inside. It was found possible, for instance, to deposit a layer of iron up to about 2 mm. in thickness on any simple cylindrical surface of wrought iron or steel, mild or cast, and although, in a paper just read before the Iron and Steel Institute*, Mr. W. E. Hughes, late chief research chemist to the Electro-Metallurgical Committee of the Ministry of Munitions, points out that the work was not done under proper scientific control, and that the results, although apparently satisfactory, were very far from being so in fact, an earlier paper before the Institution of Automobile Engineers, by Major B. H. Thomas, described the conditions under which the work in the field was carried out, which were very different from those obtaining in a laboratory. At the same time, Mr. Hughes did not intend his comment to be taken as adverse criticism, but only as pointing out some of the defects which may occur unless workshop conditions, in commercial practice, are much more scientific than they were, of necessity, under war conditions.

The necessity for quickly building up worn parts made itself felt in 1915, and in the third heavy motor transport repair shop in France, the process was applied under difficulties. The solution which was found to yield the best results was made up of ferrous ammonium sulphate at a strength of 75 grammes per litre of water, with a current density of 0·1 ampere per 30 sq. cm. The rate of deposition was 0·005 mm. thickness per hour, and the operation was carried out in separate vats of approximately 30 litres capacity. The general method of operation was to suspend the work in a vertical position in the vat,

* ELECTRICAL REVIEW, May 28th, p. 681.

Digitized by Google

by means of standards fixed to the bench, which were provided with universally jointed arms fitted with clamps at the end to hold the work. The anode was then suspended from a rocker arm, and made to surround the work concentrically as, especially with thick deposits, it appears to be important to keep the anode as nearly as possible equidistant from the work at all points. The anodes were made of Swedish iron wire about 16 S.W.G., thoroughly annealed and wound into the form of a woven cylinder. They were suspended and stiffened by means of a ¼-in. iron rod on one side, which was attached at the top to the rocker arm. The anodes were fitted, in addition, with two celluloid cones to produce an upward pumping action. The effect of this action was found to be important, as it is essential to avoid having stagnant solution in contact with the work, and it is also desirable to keep the ferrous carbonate in the solution in a state of suspension. Some difference of opinion existed between the motor transport repair officers and the R.A.F. repair officers as to whether it was better to deposit the metal direct or on a thin film of copper. The latter view was held by the R.A.F., but on the other side, the efficacy of such a method was contested. The R.A.F. people apparently found that good results followed the practice of applying a thin film of copper and then a layer of iron, repeating the process when greater thicknesses were required. However, the advantages of one method over another are subjects for investigation and experiment. The point is that the work which was carried out during the war has opened up a prospect of considerable economies for machinery users by electro-deposition, and it is to be hoped that this valuable experience, gained at the public expense, will not be allowed to be wasted. It is improbable that private individuals in normal times would have been able to undertake such work, and good use should now be made of it.

German Electric Tramways.

It has been known for a long time past that conditions in connection with the electric tramways in Germany have been going from bad to worse, and the situation with regard to many undertakings is now becoming desperate. The chairman of one of the principal electrical manufacturing companies, which is also interested in a number of tramways, recently stated that nothing further could be gained by increasing fares. This statement is more than confirmed by the directors of a tramway company in Rhineland. They point out that it has been necessary to have recourse to raising fares in order to meet the increase in working expenses, but in this respect they have been opposed by the local authorities, who have placed great difficulties in the way of the introduction of higher fares. On the other hand, the municipal tramway fares have been advanced time after time, and in some cases the municipal councils have also increased the rates in order to endeavour to relieve the tramways—at the expense of the ratepayers in general. It is now proposed to attempt to solve the question of fares by arbitration, as in the case of the fixing of charges for the supply of energy, but experience has shown lately that increases in fares, far from yielding a larger revenue, are actually resulting in a decreased income.

The new advances made in the prices of coal with the consequential rise in the prices of materials, &c., will further prejudicially affect the working of the tramways. The charge made for power before the war to tramways not having their own generating stations, ranged from 5 to 10 pfennigs per KW.-hour; it now amounts to 40 to 50 pfennigs, and will further advance in the next few weeks, owing to the higher cost of coal. The question of introducing minimum fares of 60, 70, or even 80 pfennigs has been discussed by a number of tramway managements, but these have been vetoed by municipal bodies, on the ground of political considerations, recourse being again had to the indirect method of increased rates and taxes.

Some interesting examples are given in order to demonstrate the great increase in the cost of permanent-way material, rolling stock, &c., during the war. For instance, the sale price of tramway rails, which amounted to 139 marks (£6 19s.) per ton on the outbreak of war, reached 300 marks in March, 1919, and is now 3,200 marks per ton. The price of copper has risen from 1·50 to 52 marks per kilogramme in the same period of years; and the cost of a motor-tramcar has advanced from 15,000 to 200,000 marks, while the cost of maintaining or renewing the surface of the tramway tracks has also enormously increased. It is contended that the tramways can no longer continue to meet the heavy expenditure, and that they will be brought to a standstill in the near future—as has already taken place in the case of both private and municipal lines of minor importance—unless an improvement is brought about in some form or another.

"Situations Vacant."

In our "Correspondence" columns to-day, "J. C." approaches the vexed question of "Box numbers" and their associations from a somewhat novel point of view. As regards the inability of the applicant to guess at the identity of the advertiser, we may point out that our Advertising Department makes provision for the case in which the applicant desires that, if the advertiser is, say, "Mr. X," his letter shall not be forwarded to that quarter—such letters are destroyed. Again, the failure to acknowledge the receipt of replies to an advertisement, and to inform unsuccessful applicants as to the result, shows a lack of ordinary courtesy to which we have previously drawn attention; why should a man who answers an advertisement, but fails to secure selection, be treated as though he were a dog? To our mind the practice is a serious breach of good manners. The neglect to communicate with an applicant who has been granted an interview, and whose hopes have been raised thereby, is a still graver discourtesy, and may involve serious injury to the victim's interests, for he may refuse good openings whilst waiting in the confident expectation of securing the appointment. He has a clear right to be informed of his fate as soon as possible after the decision is made.

But the main point which our correspondent makes is of graver import. The suspicion that employers who are members of certain great associations have secret arrangements for preventing members of their staffs from moving from one firm to another within the same association, whether well-founded or not, has in the past given rise to much bitter feeling, and if it were justified in fact, would constitute not only a gross and illegal infraction of the rights of a free man, but also would be fraught with dire results to British industry in the long run. Our best and most worthy engineers and artisans would miss no opportunity of transferring their services to some country where freedom could still be found; to remain here under such a tyrannical *régime* would be unbearable.

Such suspicions, as our correspondent says, if not true should be allayed, and his suggestion that the subject should be brought to the notice of the Joint Industrial Councils is very commendable. It can, however, apply only to the case of members of Trade Unions, for the Councils as yet afford no representation to members of technical staffs, and the only instance in which this omission has been rectified is that of the staffs of power stations, who now have their Joint Industrial Board. So far as the field remains uncovered, apparently, we must look to the Society of Technical Engineers for appropriate action; and we are so frequently asked nowadays what that society is and what it is doing, that we suggest to its directors the desirability, or even the necessity, of its abandoning, at least in part, its customary secretiveness and telling the public something more of its aims and work.

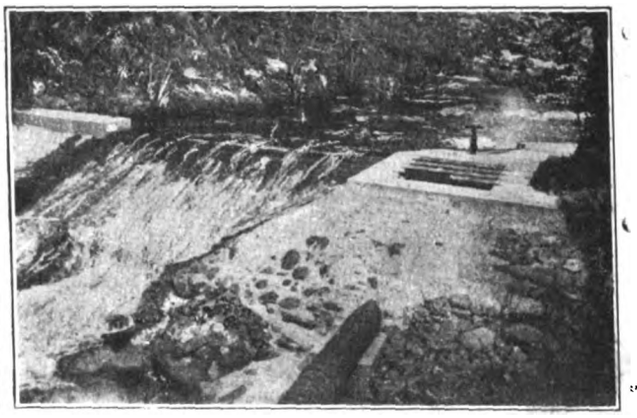
A MODERN ALL-ELECTRIC COUNTRY HOUSE.

By THOS. B. WRIGHT, A.M.I.E.E.

In December, 1918, the writer was instructed to prepare a scheme for lighting, heating and cooking required at a large country house, and told that it was all to be done with water power. In January, 1919, a few days were spent on the job, taking particulars, and principally surveying and levelling off the various alternative water-power schemes. Work was actually started early in February, and the installation was working on August 4th, 1919.

So far as we know, this is the first large completely electrical country house in the kingdom.

The Dam, from Up-stream side.



View of Dam, showing Overflow and Intake Tank.

The river passes near the house and is fast flowing, running in a rocky ravine, and is subject to very rapid rise and fall. It is fed by many good springs and a large hill loch.

A 6-ft. dam wall is built across the river, about 25 ft. thick at bottom and sloping up to about 6 ft. thick at top. The overall length is about 65 ft., and both ends are securely built into the solid rock. At the high end of the dam, starting behind the centre line is built a large concrete intake tank measuring 11 ft. 4 in. by 8 ft. 3 in., connected to the reservoir by a concrete duct about 6 ft. long by 4 ft. wide and 2 ft. 6 in. high. A heavy rough bar iron strainer of about 80 sq. ft. area is fitted outside this duct, in addition to a large cast-iron gate sluice. Inside the intake tank is the fine strainer made of perforated cast-iron plates.

From the intake tank about 260 ft. of 26-in. bore riveted steel pipe is carried on stone piers built on the river bank to a concrete connection tank, with manhole, and from this tank about 800 ft. of 27-in. bare special rock concrete pipes are carried underground to a second concrete tank with manhole. The head of water on this tank is about 20 ft. The relief pressure open-ended concrete pipe is taken from the base of this tank.

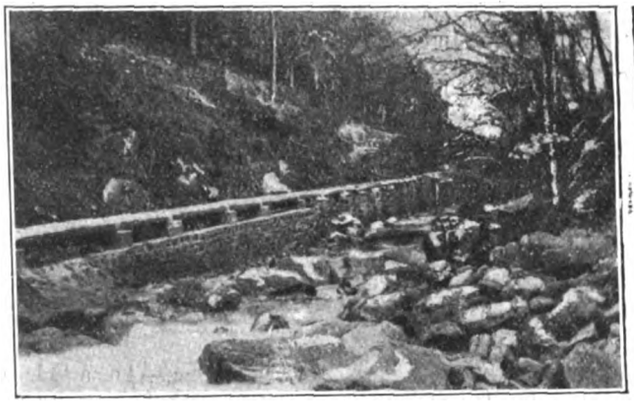
About 200 ft. of 26-in. bore riveted steel piping is carried on concrete piers downhill to the power house, special anchorage arrangements being made for the piping, which ends in a large cast-iron "Y" bend, each tail having a large slow-acting sluice-valve fitted.

The measured head is 96 ft., including 17 ft. of suction tail piping. The suction pipe discharges vertically into a concrete duct, from which the water returns to the river.

At present one turbo-dynamo set of 110 B.H.P., consisting of a Gilkes Francis turbine and an E.C.C. dynamo, is installed, and a second set of 50 B.H.P. is on order. The working pressure is 250 volts, but the generators are over-compounded to give from 250 volts at light load to 265 at full load. An oil governor is provided.

The main power house switchboard is built up of heavy marble slabs mounted in angle-iron framework, two panels control the generators, and a third panel the outgoing mains. The usual meters, switches, and fuse gear, &c., are fitted on each panel.

Three pairs of V.I.R. cables in tubing connect the switchboard with the outside overhead line. This line consists of three pairs of 37/14 S.W.G. bare copper wires run on poles about 20 ft. above ground level, protected at both ends by lightning arresters. The overhead line is about 300 yards in length, after which a pair of 0·5 sq. in. bitumen cables are laid solid to the house, a distance of about 210 yards.



Steel Pipe Line below Intake.

Concrete Pipe Line.

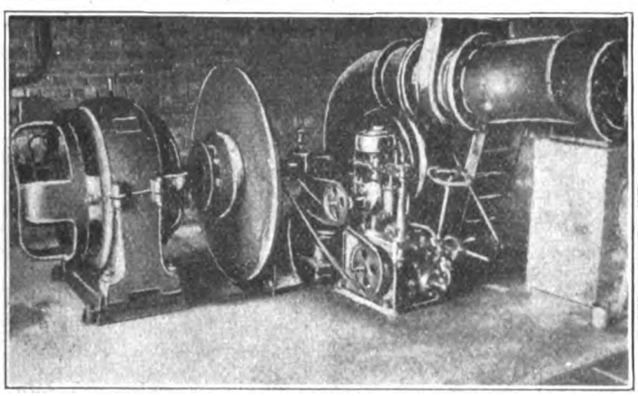
At the house the cables terminate at the main switchboard. This board has four heavy main switches (controlling the lighting, radiators, power, and cooking panels), and separate panels for the various meters, switchgear, and sub-fuses. A recording ampere-meter is fitted, from which most interesting records are being taken.

The switchboard is of polished white marble, and is

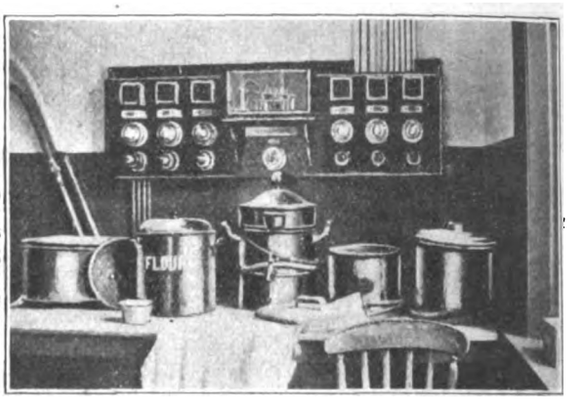
Digitized by Google

mounted with free access to all parts both back and front. The whole of the wiring work is carried out with C.M.A. cables run in heavy screwed steel tube in the contractor's usual standard manner.

The heating installation consists of about thirty 20-amp. radiator sockets and switches, fitted in all cases in special iron boxes in the skirtings, with brass face plates. Double-pole diamond H switches are used throughout. Each radiator socket forms a separate circuit from the main board. The radiators are generally of 3-KW. capacity each, with three-heat control, having elements made up of flat wire wound on mica. The heating of the house is much better than when coal fires were used. Normally the radiators are turned on full for from half an hour to an hour, then turned to half heat.



GILKES-E.C.C. TURBO-DYNAMO, WITH OIL GOVERNOR.

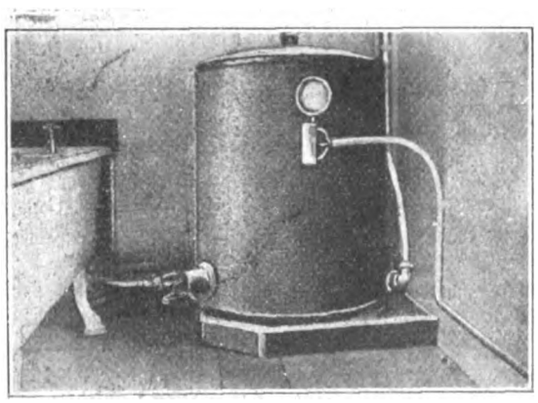


SCULLERY SWITCHBOARD FOR COOKING APPARATUS, AND CALORIFIER RELAY.

For water heating four calorifiers are used. One of 70 gallons capacity supplies hot water to the kitchen, scullery, wash-house, pantry, and to two dressing rooms and bathroom overhead. Another of 70 gallons capacity is erected in a clothes drying-room—where its waste heat is used—and supplies two bathrooms and four lavatory basins.

One of 50 gallons capacity is fitted in the principal dressing-room, supplying bath, basin, &c., and another of 50 gallons capacity is fitted on the top floor, supplying a bathroom and basins there. Two instantaneous water-heating geysers are fitted experimentally, but these are not needed.

The 70-gallon calorifiers are each fitted with immersers of 8 KW., but normally only 6 KW. are used. The 50-gallon calorifiers are each fitted with immersers of 6 KW. All the calorifiers are fitted with thermo-control double-action



FIFTY-GALLON CALORIFIER.

switchgear, combined with a double-coil relay which makes and breaks the main current in mercury cups. The thermo-switch and relay are operated by means of a battery of dry cells. The water is always maintained at a constant pre-arranged temperature of 170° F., night and day, but could equally well be kept at any desired temperature less than boiling point.

The cooking apparatus consists of one double oven range, each oven being provided with three-heat regulation. Each oven is loaded to 3 KW. capacity, and the internal size is 18 in. × 18 in. × 14 in. The hot table above is fitted with four 8-in. 1,100-watt and two 6-in. 600-watt hot-plates in addition to a plate-warmer and a 15-in. by 10-in. grill loaded to 2,000 watts. Each separate unit has three-heat regulation fitted. All switches, fuses, and indicators are mounted on iron barrel standards above the range. Two fish kettles or stewing pans are fitted, one of 18 in. size, and one of 22 in. size, and in addition a baker plate and various sizes of boiling pans, both lined and unlined, are provided. A hot closet loaded to 1 KW. is fitted in the pantry, close to the dining-room service door. Small table sets of toasters, egg boilers, coffee pots, &c., are also in use.

Special circuits are fitted for the motor washing machine, ironing machine, mangle and drying room, and in the laundry for the usual hand electric irons. The heating apparatus is mostly of the Falkirk make.

The estate cottages and offices are also being lighted and heated in the same way, and provided with electric cooking.

The whole of the arrangements have been worked out in such a way that one of the estate men is able to attend to the running of the installation, in addition to his other duties. The turbines run night and day. The running cost, therefore, is very small, and is made up of part of this man's wages plus the cost of lubricating oil, and a periodical inspection visit of a skilled man every four months.

The maintenance cost so far has been nothing, no renewals of any kind having been supplied. All the elements used for heating are of the easily replaceable type, so that when any do burn out they can be replaced by the man on the job.

The domestics are highly delighted with the working arrangements, and in the course of a few days were working the electrical apparatus freely and confidently. One of the first things found out was that instead of having to get up before 6 a.m. in order to be ready for breakfast time, they do not require to be down till after 7 a.m. This is owing principally to having no fires to clean and lay, hot water always being ready, and the absence of dirt.

The contractors for the whole survey, design, and carrying out of the complete installation were Messrs. Anderson and Munro, Ltd., electrical engineers, Glasgow. It is interesting to note that this most modern electrical installation was carried out by the oldest firm of electrical engineers and contractors in the kingdom.

Anglo-Swiss Commercial Relations.—An article on this subject is contributed to the first number of the *Anglo-Swiss Review* (May 1st) published at Basle. The author is Mr. J. B. Cahill, the British Commercial Attaché at Berne. He gives tabulated statistics relating to trade between Switzerland and the British Empire, discusses where British methods of dealing with the market have fallen short in the past, and refers to the recently established British Chamber of Commerce for Switzerland, and the service which it should be able to render. He states that the effort on the British side to secure Swiss business has been sadly wanting in the past, and urges British firms to explore more minutely the potentialities of the market, and to make organised efforts on settled lines to start or to develop trade. Membership of the new Chamber of Commerce should greatly assist them to that end. Among the other articles in the *Review* is one on "Mutual Interests of British and Swiss Machine Industries," by O. Cattani, and one on "University Matters: the Case for Exchange of Swiss and English Students," by J. H. Smith.

CABLE-FAULT LOCALISATION.*

By EDWARD RAYMOND-BARKER

To the "Correspondence" columns of the ELECTRICAL REVIEW of May 7th, 1920, a writer communicated a decidedly instructive inquiry as to a quick and correct method of localising a certain unusual type of cable fault. Advisedly is the adjective "instructive" here used, for few data are more so than those descriptive of some fresh, puzzling experience; an experience utilised—may-be—by an intelligent observer, to arouse sympathetic interest of, and further inquiry from, some fellow-reader of the ELECTRICAL REVIEW, with ultimate acquisition of corroborative data and—perhaps—assistance.

The correspondent has written over the appropriate pseudonym "Kon Denser," as if, in pursuing elucidation of his problem, he, with true instinct, already scented the track of his cable's own electrostatic inductive capacity.

"Kon Denser's" inquiry has brought to the present writer—across a quarter of a century of time—a salt-laden gust, or two, from stormy seas, with distinct recollection of curious characteristics evinced by a fault (of a hitherto unheard-of species) in cable coiled in a ship's tank—a fault, however, now seen to be not without certain points of resemblance to that which has caused our fellow-reader "Kon Denser" to send out a somewhat urgent S O S.

Almost exactly 25 years ago, during a fairly long voyage from port to port, through—as it happened—heavy seas and generally bad weather, we had to turn over cable and bring about redistribution of cable in the ship's tanks.

One section of india-rubber core cable was 43·684 N.M. in length, and consisted of 23·980 N.M. spliced on to 19·704. This length, at an observed temperature of 58° F., ought to have shown a conductor resistance of just over 463 ohms, and an inductive capacity of a little over 14 mfds.

Yet tests on this piece of cable presented curious, and, at first sight, inconsistent features.

Insulation.—Whether test was applied to top end in tank while bottom end *free*, or *vice versâ*, or into both ends looped, insulation was good, and showed normal dielectric resistance for the whole 43·684 N.M.

Capacity.—(Whether by comparison of deflection throws, or by the Kelvin method.)

Results of tests (1) into top end while bottom end *free*, or (2) *vice versâ*, or (3) with ends looped, always gave the correct total capacity of just over 14 mfds.

Conductor Resistance.—Here was the mystery. Tested by various methods the C R of this piece of cable, instead of being what it ought to have been, namely, about 463 ohms, persistently gave a steady three hundred and fourteen thousand ohms (314,000ω).

All this appeared to point to a broken conductor with ends separated within the rubber covering. Yet with some degree of continuity through, perhaps, a conducting film, on the inner surface of the rubber, sufficient for passage of static charges in the inductive-capacity tests.

How, then, if capacity charges always got past the break, over the film, was the break in the conductor to be localised?

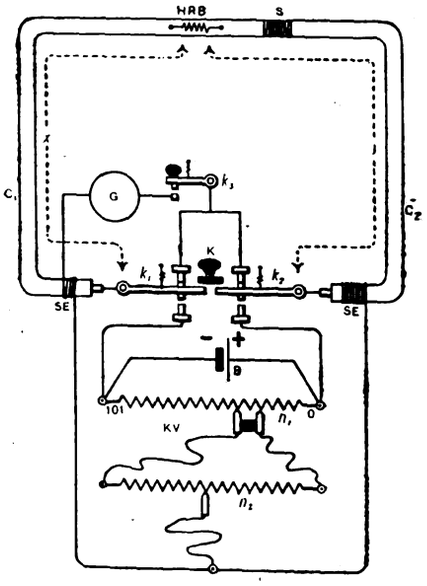
The late Mr. C. N. C. Evers, then acting, on board, as the present writer's senior assistant, made a very good suggestion as to the possibility of obtaining by the use of slides, relative distances from the two ends of the 43·684 N.M. cable by means of charging simultaneously the two ends of the cable from opposite *sign* potentials, from some very low E.M.F.

This happy suggestion, due to Mr. C. N. C. Evers, was successfully effected by the present writer using Kelvin capacity test connections with Kelvin-Varley slides.

Instead of the cable being balanced against a standard condenser, one cable end of the 43·684 N.M. was balanced against the other, the high-resistance film at the break being, in this case, of a resistance sufficiently high to keep separate the two adjacent but opposite *sign* charges.

In this manner, then, two charges were to be adjusted, by means of the Kelvin-Varley slides, to balance each other when blended or mixed, the slide-reading then indicating not only relative charging potentials, but also the relative amounts of the two cable charges in the two portions of the total length of 43·684 N.M. This, of course, is tantamount to giving the relative lengths on either side of the fault. Thus the fault is localised.

The connections as arranged by the present writer are shown in the accompanying diagram:—



C_1 = 23·980 N.M. of I.R. cable.
C_2 = 19·704 „ „ „ „

43·684 „ total cable section joined through at splice S, and coiled in ship's cable-tank.

H R B = High-resistance break of conductor inside dielectric.

S E = Cable-sheathing "earth" connection.

B = One Leclanché cell.

G = Sullivan mirror galvanometer ("Marine" pattern).

K V = Kelvin-Varley slide resistances = 100,000ω.

K k_1 k_2 k_3 = Lambert mixing key for Kelvin capacity tests.

K depressed causes k_1 k_2 to connect up C_1 and C_2 respectively to opposite sign battery potentials.

K raised causes k_1 and k_2 to rise and to connect and blend converse electrical cable charges balanced by means of the K V slides till depression of k_3, after the said mixing, gives deflection throw *nil* on G.

[*Note.*—The Lambert mixing key is shown here as it lends itself well, in the various stages of the test, to diagrammatic clearness. See H. R. Kempe's "Handbook of Electrical Testing." Seventh edition, p. 405. The key actually used by the present writer was W. A. Price's excellent (Silvertown) mixing key, as shown in H. D. Wilkinson's "Submarine Cable Laying and Repairing." Latest edition, p. 483.]

Dotted lines *x* and *y* show relative position of high-resistance break (H R B) as deduced from test with K V slides, n_1 n_2 = slide reading of 2,559, *i.e.*, 2,559 out of 100 × 100 = 10,000 total subdivisions of the slides

* On May 20th this article was posted to the Editors of the ELECTRICAL REVIEW. On May 23rd the writer received privately from "Kon Denser" interesting data and incidental proof that, at 3 p.m. on April 24th, he was called upon to tackle the fault-localisation, and that, by capacity methods, not only was the fault successfully localised, but by 6 p.m. the repair had been effected, and the plant was again running O K. Owing to academic and theoretical interest attaching to an unusual type of fault, "Kon Denser" wrote to the ELECTRICAL REVIEW the letter which appeared on May 7th. On his own initiative does the present writer add this note to show that, after all, it was "off his own bat" that "Kon Denser" attained success.—E. R.-B.

Digitized by Google

causing relative charges on each side of the high-resistance interior fault H R B to neutralise each other, so that deflection throw on G when k_3 is depressed becomes *nil*.

The slide-reading 2,559 gives the proportion :—

2,559 : 10,000 :: x : 43·684 N.M. or x = 11·179 N.M.
7,441 : 10,000 :: y : 43·684 N.M. or y = 32·505 N.M.

10,000 43·684 N.M.

Distance of fault from splice = 23·980 N.M. − 11·179
= 12·801 N.M.

This merely approximate value was sufficiently accurate to point to the fault being at the sixth joint in this length of cable, which joint, by section-book, was 12·111 N.M. from splice S.

This cable was then turned over from one tank to another. When the cable was purposely bent at the sixth joint-mark, the electrical control test gave indications of the fault being there. On the cable being cut, the conductor was found to have been broken at the braze of the sixth joint. Although the conductor, together with its lapping of fine copper wire, had been severed, and the two portions of the braze slightly drawn apart, a high-resistance, but nevertheless conducting film (= 314,000 ohms), due to chemical action between the braze and the surrounding india-rubber, had formed on the inner surface of the rubber, just, in fact, as the curious behaviour of the cable when first tested successively for insulation, capacity and conductor resistance, had led one to suspect.

To sum up :—It appears to the present writer that, in certain respects, the foregoing instance is somewhat analogous to the case cited by "Kon Denser."

In the latter instance, one of the copper conductors of a twin cable embedded in glazed troughing run in with pitch and capped with tiles, had developed a fault owing, apparently, to water getting through the pitch and eating away the copper strand. The resulting sulphate of copper at the fault gradually came to constitute a comparatively non-conductive block, this block virtually insulating, one from the other, each side of the severed copper strand.

Except that, in this instance, the insulation of the cable appears to have been affected primarily, from the outside, by water—whereas in the case cited by the present writer, cable insulation remained unimpaired—the two cases seem fairly analogous.

Hence it would be most interesting to know if electrical tests on lines similar to those afore-described—namely, by balancing, in the Kelvin mixing method, the two cable capacities separated by the copper sulphate crystal block—have helped in any way to solve the problems so interestingly described by the ELECTRICAL REVIEW correspondent "Kon Denser." To him, by the kind courtesy of the Editors of the ELECTRICAL REVIEW, the present writer has already been privileged to communicate some suggestions.

Since the above matter was written the writer has heard that "Kon Denser's" two cables are without any metallic sheathing or wire armouring.

This leaves one rather in doubt (1) as to the inductive capacity of the two braided wires laid in glazed troughing run in with pitch, the nature of the bed in which the trough lies being doubtful, and (2) as to whether the inductive capacity conditions—whatever they may be—*are uniform* along the entire length of "Kon Denser's" two braided conductors.

If conditions be not uniform, the difficulty of localising an insulated break is much greater than it would otherwise be.

It might, however, be feasible to act in the following manner: Earth the good cable, and, with one pole of testing cell likewise to earth, measure relative inductive capacities between the faulty line (respectively on each side of the high-resistance break fault) and the good line which has been earthed.

Actual capacities in terms of microfarads would not be necessary. Relative discharge throws, in terms of scale divisions on a mirror galvanometer scale, from the two cable ends would be sufficient so long as exactly similar testing conditions prevailed at both ends of the faulty line.

Relative charge, or discharge, deflection throws—from any really insulated break—would indicate relative cable lengths out of the total length of 100 yards which, according to "Kon Denser," is the length of his twin cables.

Similarly, with the faulty cable earthed at both ends, a charge, or discharge, deflection from the good cable (insulated at the far end) in terms of galvanometer-scale divisions, ought to be equivalent to the sum of the two deflection throws from the two separated sections of the faulty cable, when the good cable was earthed.

"WIRED WIRELESS" TELEGRAPHY AND TELEPHONY.

REFERENCE has from time to time been made in our pages to the experiments that have been carried out by the U.S.A. Signal Corps in connection with multiplex telephony and telegraphy over open-circuit bare wires laid in the earth or under water. A paper on this subject presented to the National Academy of Sciences in April last by Major-Genl. G. O. Squier, chief signal officer, U.S. War Department, was recently abstracted by *Science*, from which the following particulars are taken.

The "key problem" in the procurement of essential Signal Corps supplies in the United States during the war, curiously enough turned out to be the production of the necessary braiding machines for finishing insulated wire. The bare wire itself and the insulating materials could be obtained, but the necessary machinery for braiding the thread was never anything like adequate for the enormous supplies required in the field.

The braiding capacity of the entire United States, at September 1st, 1918, was about 8,000 miles of twisted pair insulated wire per month, while the requirements for the American forces alone at that date were about 40,000 miles a month. The Allied Council decided that beginning March 1st, 1919, the United States should furnish all of this type of wire used by the Allied armies in the field. To supply this amount of insulated wire would have required cargo space for overseas shipment to the amount of 14,000 ship tons a month, but had it been possible to use single conductor bare wire in place of the twisted pair insulated wire, the space required would have been reduced to 2,500 ship tons a month, thus releasing the balance for transportation of other vitally necessary supplies.

The above facts show the necessity of developing, if possible, new methods by which a reduction may be effected in the enormous quantities of expensive and bulky insulated wire, which was so difficult to procure, and which must now be buried in the earth to a depth of 8 or 10 ft. throughout the advance sectors of the front line of a modern army.

The following reasoning led to the carrying out of the experiments to be described :—

1. Since we can already communicate by radio means between one submarine and another submarine both completely submerged, it was considered that connecting two such stations by a submerged copper wire could have no other effect than to facilitate the propagation of the electric waves between the stations.

2. It was considered possible that the behaviour of earth or water under the action of high frequency currents might exhibit greatly different properties from those with which we are familiar at direct or low frequency currents.

3. It was realised that whatever high frequency energy losses might occur in the case of bare wires laid in earth or water, yet the over-all efficiency would be higher than in the case of radio space transmission where the plant efficiency is so very low.

4. It was noted by the writer in September, 1910, that the three-electrode audion could be used as a potentially operated device on open circuits. This arrangement was considered reliable for the reception of the signals over bare wires in earth or water.

The first experiment was a simple one: A bare No. 18 phosphor bronze wire was laid across the Washington Channel of the Potomac river. It was paid out with sufficient slack to lie on the bottom of the river. A standard Signal Corps wireless telephone and telegraph set, SCR 76, was directly connected to each end of the wire, one set serving as a transmitter and the other as a receiver. At the receiving end of the line the bare wire was directly connected to the grid of the receiving set and the usual ground connection left open. A frequency of about 600,000 cycles a second was used, and the line tuned at each end by the usual methods. Excellent telegraphy and telephony were obtained. Care was taken to make this preliminary experiment as simple and basic as possible and precaution taken to ensure that the wire itself

Digitized by Google

should be bright and clean and entirely free from any grease or other insulating material.

This success immediately led to more thorough consideration of the entire subject. The following experiment was made:—

A strip of wire netting was buried in the snow outside an office in Washington and a wire attached thereto leading to the second story of the building. The upper end of this wire was connected directly to the grid of an electron tube, which was to be used as a potentially operated device. It was necessary for maximum sensitiveness to connect it to the point of maximum potential of the antenna which in the case of a linear oscillator occurs at the open end. By this arrangement, messages were readily received from distant points in the United States.

These two simple experiments demonstrated the possibility of transmitting electromagnetic waves along bare wires submerged in water and the use of an electron tube as a potentially operated device for the reception of signals. The Signal Corps has recently undertaken certain investigations in the phenomena connected with the transmission of high-frequency electromagnetic waves over bare wires in earth and in water. In attacking the problems from various angles, the research staff of the Signal Corps laboratory at Camp Alfred Vail, Little Silver, New Jersey, was directed to carry out experiments on bare wires laid on the surface of moist ground and also buried in earth. The Signal Corps research laboratory at the Bureau of Standards was directed to investigate fundamentally the transmission of electromagnetic waves over bare wires in fresh water. In addition to this, the office of the Chief Signal Officer has carried out from time to time certain experiments of a more or less crucial character which have come up for solution in the prosecution of this work at the other laboratories. The phenomena associated with the transmission of high-frequency waves over bare wires in earth or water are obscure and complex, and the writer has formulated no definite theory at the present time.

The results obtained are as follows:—

1. Telephone and telegraph communication has been established across the Potomac river, below the city of Washington, over a distance of about three-quarters of a mile, by the use of a bare No. 12 phosphor bronze wire laid in the water to connect the stations. The transmitter consisted of an electron tube oscillator which delivered a current of about 270 milliamperes to the line at a frequency of about 600,000 cycles a second. At the receiving end of the line an electron tube and a 6-stage amplifier were used without any ground connection. With this arrangement good tuning was obtained at both ends of the line, and telegraphic and telephonic transmission secured over the bare wires immersed in fresh water.

2. A resonance wave coil has been developed in the form of a long helix wound with a large number of turns on which stationary waves are produced by the incoming wireless signals. An electron tube is used as the detector, the grid being connected to the point of maximum potential on the coil. The wave coil may be used either as a part of the usual antenna system or a part of a line wire, or it may act itself as the antenna for picking up the energy of the signals. In the latter case the coil may be either free at both ends or grounded at one end. Good results have been obtained in either case. It has been also found that the open coil has directional properties and can be used as a goniometer not only for horizontal measurements, but for vertical measurements as well. This form of wireless goniometer has the great advantage that it permits not only of determining the plane where the signals are strongest, but also the direction from which such signals proceed.

Telegraph and telephone communication has been also established between two stations at Camp Alfred Vail, using a bare No. 16 copper wire buried in the earth to a depth of about 8 in. to connect the stations. The distance between the two stations was three-quarters of a mile. Frequencies as high as one million cycles a second were used. Similar communication has been carried on over a bare wire one and three-quarter miles long laid on the surface of moist earth. The current at the transmitting station in these installations was about 100 milliamperes. It has been shown that a bare wire buried in moist earth with the distant end open can be tuned both at the transmitting end and at the receiving end.

In the older art of ocean telegraphy, the elaborateness of line construction has already reached a practical limit. The most promising hope of improving the line construction for ocean cables is believed to be to abandon the present method of design and construction, and to start with the simple case of bare wires in water, using high-frequency currents, and study the necessary changes to produce optimum transmission. The use of a high-frequency "carrier" has the inherent advantage that the distortion phenomena accompanying present methods of long-distance transmission are eliminated, and we are principally concerned with the problem of reducing attenuation. The most suitable voltage may be employed and present multiplex methods may be utilised. The electron tube is available for both the generation and the reception of the waves.

During the last few years an intensive study has been made of the surface conditions of wires necessary to produce the emission of electrons, and to this intensive study, both by universities and industrial research laboratories, is due the high state of efficiency of the present electron tube. Nothing short of a similar study of the surface conditions of wires for preventing the emission of electrons instead of producing them, will finally give us the wire conductor of the future.

The development of types of resonance wave coils, both open at one end and at both ends, for general wireless work offers an interesting field for investigation. This involves the study of the electron tube as a potentially operated device. The application of such coils properly designed for specific purposes may lead to the practical solution of a number of wireless problems such as directional effects, and wave coil antennæ of very small dimensions.

THE ELECTRIFICATION OF HOLLAND.

A NATIONAL SCHEME.

One of Holland's greatest difficulties as an industrial country has been the high cost and consumption of coal in all her industrial undertakings. This it is now proposed to remedy by an extensive scheme of electrification, embracing practically the whole country. According to the *Board of Trade Journal*, a network of H.T. transmission lines has been planned (fig. 8), and it is hoped that in due course Dutch industries shall enjoy the advantages of cheap power in order to be more favourably placed for export purposes against more fortunate competitors. In any case, it is considered that great economies will be effected by concentrating the various electricity supply undertakings into a national scheme which, at the same time, will be useful to develop the smaller manufactories all over the country.

Fig. 1.—Electric Winder.

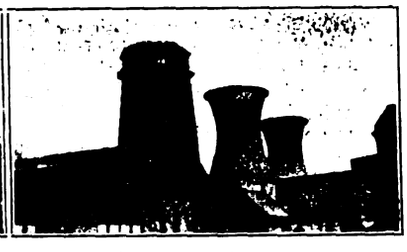


Fig. 2.—Cooling Towers. Limburg State Coal Mines.

The scheme, as at present estimated, is to cost 125,000,000 florins, and it is understood that as Dutch manufacturers are not in a position to tender for all the plant required, a fair proportion of this will be placed abroad. Already orders amounting to over £1,000,000 have been secured in this country.

There are several companies in Holland supplying electrical power, &c., in various localities. Their activities, under the new scheme, will be allied to those of the State—the former being charged with the 10,000-volt, and the latter undertaking the 50,000-volt distribution. Such a scheme will necessitate the surmounting of many difficulties in such a country as Holland, which lacks any assistance from water power.

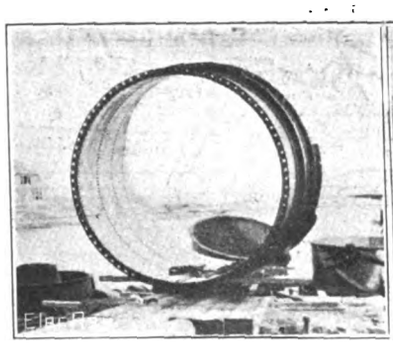

Fig. 3.—Large Pump Casing.

Fig. 4.—Outdoor 3,000-volt Switch at a Farm.

The following table illustrates the very considerable increase that has taken place in the consumption of electrical power, &c., in Holland since 1913:—

Digitized by Google

	Max. load on station. KW.	Total consumption per annum. KWH.
1913	45,600 ...	114,000,000
1914	53,600 ...	134,000,000
1915	69,600 ...	173,000,000
1916	88,400 ...	221,000,000
1917	90,000 ...	216,000,000
1918	100,000 ...	240,000,000

To meet present requirements the Government Committee reporting on the question under the present scheme is of opinion that it is necessary to arrange for a total load on the electrical power stations of 4,000,000 KW., giving a total capacity of 1,000,000,000 KW.-hours per annum. Such a supply will mean, with an anticipated population of 10,000,000 inhabitants in the next 30 years, a consumption of 100 KW.-hours per head per annum, as against 35 to 40 at present. This will compare with a present approximate consumption in the United States of America of 176 KW.-hours per head, 140 for Switzerland, 60 for England, 50 for Germany. The estimate does not take into account the electrification of railways and the replacing of all steam traction by electric traction, for which it is provisionally estimated that 250,000 KW. will be necessary, although not more than one-third of this amount will be required for the next 15 years.

The construction of the transmission lines for the whole country may take from 5 to 10 years. For the H.T. network three-phase current, 50 cycles, is to be adopted, the minimum voltage being 50,000. The capacity recommended for the power stations supplying the system is approximately 30,000-75,000 KW. Each station will be equipped with generators developing 15,000 KW. As the first step in the scheme, certain

FIG. 8.—PROPOSED H.T. NETWORK IN HOLLAND.

legislation is necessary to empower the Government to take over those electrical supply undertakings which are necessary for incorporation in the scheme. These are:—

1. The power station at Geertruidenberg, with the 50,000-volt lines in the Province of North Brabant belonging to that power station.

2. The recently-built power station of the municipality of Amsterdam.

It is also recommended that the construction of H.T. lines should commence immediately as under:—

1. Roosendaal-Flushing or Middelburg.
2. Helmond or Uden—South Limburg.
3. Geertruidenberg-Rotterdam-The Hague-Amsterdam, with a branch line to Utrecht.
4. Uden-Nymegen-Arnhem-Zwolle.

The cost of the above is estimated at 35,000,000 to 40,000,000 florins.

As far as is known at present, a special Administration is to be created for this service. Several alternatives have been under consideration, particularly a proposal under which the State would hold a large block of shares in a company registered for the purpose. Preference has been given to a State enterprise under which the supply of electricity is to be a direct Governmental service endowed with a large measure of freedom. Working agreements will be made as to the supply of electricity and the sharing of profits with municipal and other companies administering the scheme.

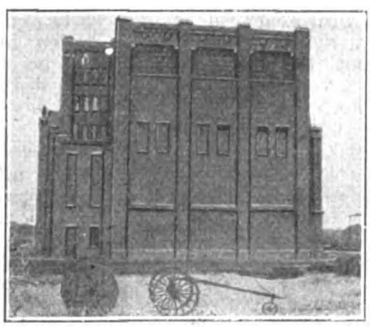

FIG. 5.—50,000-VOLT SUB-STATION.

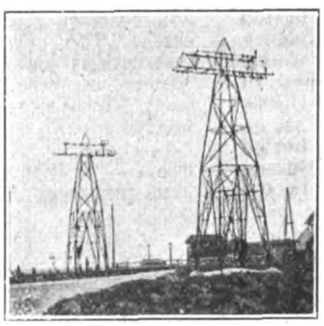

FIG. 6.—50,000-VOLT LINE CROSSING RAILWAY.

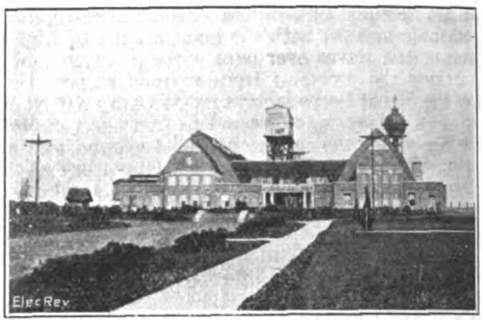

FIG. 7.—LIMBURG STATE COAL MINE.

A committee, formed by the Society of Directors of Electricity Supply Undertakings in Holland, has been investigating this proposal for some time past, and is to publish a report in eleven parts, four of which have been issued up to the time of writing. The first deals with the question of determining the positions of the H.T. transformer stations. The committee has calculated that for loads of 7 to 20 KW. per sq. km., the feeding of the 10,000-volt cables with 50,000 as well as with 100,000 volts will be secured in the most economical way if the transformer stations are 20 to 30 km. apart.

In the second, the feeding of the high-tension transformer stations (determining the area of wires, &c.) is reported on. The average distance of the feeding points of the 10,000-volt distribution cables having been fixed, there remains the question of voltage and the cross-section of the H.T. lines, which have to feed the 50 transformer stations. The calculations are based upon the supposition that the transformer stations are situated at regular distances of 25 km., and that they are all equally loaded. The results of these calculations are shown in graphs, added to the report.

These graphs also show that for large but sparsely populated districts a very high voltage is most economical, whereas for heavily-loaded industrial centres a lower voltage is to be preferred. It is furthermore evident from this report that the concentration of the generation of electricity has its limits, and it will be preferable, above a certain amount of power (*e.g.*, 30,000 to 50,000 KW.) to erect more power stations instead of making a heavier H.T. distribution system.

So the second part of the report gives an idea not only of the voltages and cross-sections of wire, but to a certain extent also of the number of power stations wanted. The third report deals with the scheme from the point of view of national defence.

In the last, the transmission of electrical energy from the mining district is outlined. It is stated that in addition to feeding the transformer stations the H.T. lines should also be capable of performing other functions. They should, for example, be able to transmit electricity from places where, for some reason or other, the costs of generating electricity are very low. The question of feeding a part of the network from the South Limburg mining district is then specifically examined.

For the accompanying views of electrical installations in Holland we are indebted to Mr. C. H. Wordingham; they were taken during the I.E.E. tour in Holland in September last, of which an account was given in our issue of October 24th, 1919.

Strike at Sheffield.—Through a strike of the National Amalgamated Union of Enginemen and Firemen against the three-shift system, a number of big works in Sheffield were closed down almost completely on Monday. Messrs Hadfields and other works together had 20,000 employés thrown idle.

ALL-BRITISH SWITCHGEAR.

MESSRS. A. REYROLLE & CO., LTD., HEBBURN-ON-TYNE.

THE now well-known business of Messrs. Reyrolle was opened in 1901 with the manufacture of ordinary designs of open-type switchgear and accessories, including motor starters, knife switches, tubular fuses, wall plugs, &c. At that time it supplied a much-felt want for electrical apparatus of a more substantial design and sounder workmanship than was usually procurable, and as the late Mr. Reyrolle had in his earlier works in London already established a reputation for these qualities, the business was soon thriving.

Two or three years later, other experts were added to the staff, and attention was given to the production of special forms of switchgear and protective systems which were found to be necessary as more experience was gained on larger power supply systems and the uses of higher electrical pressures. Certain novel principles of design were introduced, including the complete enclosure and immersion of all conductors, for safety to life and plant. New methods of locating and isolating faults were developed and successfully applied to the power station and sub-station equipment of the enterprising local power companies, which were thus assisted in maintaining continuity of supply to their consumers.

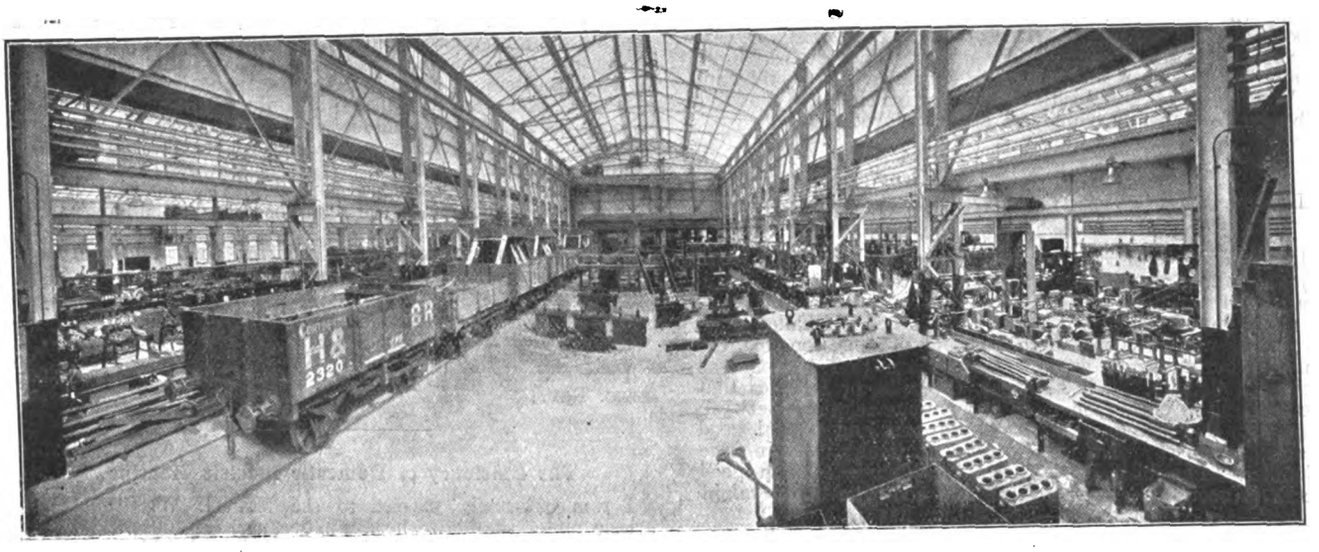
For many years these local users absorbed practically the whole of the output of this special design from this company's works, and in the meantime much valuable information was obtained of working conditions, progress was made, and designs were strengthened as required to withstand the increased stresses which were met with as the generating plant of the power companies grew in dimensions. Thus a very sound foundation of experience was quietly laid, prior to putting the new principles to the test of the market outside this district. This was first successfully attempted on a scale large enough to be of importance, in reply to a call for tenders issued by the Stepney Corporation. Notwithstanding the substantial nature of the Reyrolle apparatus, it was found possible to offer it in the open market at a competitive price.

Since that time a demand has consistently grown from the largest power supply undertakings in this country, including the Corporations of Sheffield and Glasgow. The designs have become firmly established in British practice, and one frequently hears that whatever may be thought of the general electrical engineering developments of foreign countries, at least the switchgear standards set by this company without doubt testify to the superiority of British origin.

The orders at present in hand include the largest and most important contracts ever placed for switchgear for use in Great Britain. For instance, one is for the main 20,000-volt controlling apparatus at Dalmarnock power station, one of the first super-power stations of this new electrical era. Another is for similar apparatus for Nechells, the future great generating station of the Birmingham Corporation. The fact that both these important contracts were placed at higher prices than those of competitors bears witness to the merits of the designs and the quality of the workmanship, but these of themselves might not be sufficient to satisfy a large public body if they were not also backed up by economies effected in other ways, such as reduced costs of building accommodation, every-day operation, and general maintenance.

The restricted size of the works, and the difficulties of manufacture, have, to a great extent, limited the scope of the supplies to the home market, and even there many new fields are untapped, but some time and material has been reserved to keep in touch with the fringe of the Colonial and foreign markets: for instance, switch panels for many years have been supplied to the Rand, South Africa, and to the Durban Corporation, and some important 10,000-volt sub-station apparatus to Capetown Corporation. Other work includes sub-station switchgear for railway electrification in South America; power and sub-station switchgear for the Corporations of Shanghai and Madras; and track feed and signal pillars and 20,000-volt sub-station switchgear for the Melbourne railways. As an example of the influence of this British practice on the Continent, much interest is evinced in Holland, whose engineers for the Government interlinking scheme (described elsewhere in this issue) have visited this country and have ordered armour-clad switchgear.

Messrs. Reyrolle & Co. have taken full advantage of their opportunities in all but quantity and speed of production; this exception is due only to want of material, room, and plant. As to material, improvements have been made in the organisation to ensure supplies as and when required by the shops; the handicap of limited room and plant has created the need for increased capital. New shops have recently been opened, of which we give a view, and with more adequate facilities for production, a more fruitful effort to supply the increasing demands will become possible.



MESSRS. A. REYROLLE & CO.'S NEW SHOPS.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY *cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

Composition v. Porcelain Insulators.

There has recently come into my hands a brochure, published by Thos. de La Rue, upon a composition insulator named "Telenduron," in which this material is compared with porcelain, to the disparagement of the latter.

It is granted, of course, that almost any composition material is less brittle than porcelain, though good English porcelain is much tougher and more resistant to breakage than many people imagine, more especially when the porcelain is fairly thick, as used in transmission work.

In this brochure, however, porcelain is condemned as depending upon its glaze for its insulation, and it is stated that upon the failure of the glaze by hair cracks the porcelain absorbs moisture (*sic*). This may be true of rubbish, mostly foreign, styled porcelain, but it is surprising that it should still be necessary to inform some people that proper English porcelain as made by reputable firms for the purposes mentioned (all of which porcelain is made by the wet process) does not depend upon the glaze for insulation, the porcelain being vitreous and homogeneous, and the glaze being added merely for finish and possibly colour.

"Telenduron" is set up as being non-hygroscopic and of marked superiority to porcelain, but this is not corroborated by the tests which they publish, made by the National Physical Laboratory, as shown in the following comparison:—

Tests on Post Office small insulator.	Telenduron.	Porcelain.
Flash-over voltage, dry....	40 K.V.	40 K.V.
Puncture voltage... ...	25 K.V.*	Immeasurably small.
Absorption...	·1 to ·3%	Certainly below ·01%

* NOTE.—It is important that the puncture test of any insulator should be greater than the flash-over dry. This is so with the porcelain insulator, but as the above tests show, is not so with "Telenduron."

Whatever advantage this material may have in respect of lesser liability to breakage is obtained, therefore, at the ex-

Digitized by Google

pense of its electrical characteristics. This, no doubt, is justified in many cases, but I note that in their covering letter they make reference to the use of this material for high-voltage transmission work; in this connection, electrical considerations are the primary considerations, and all others are secondary.

Then there is the question of durability, having regard to the deleterious atmospheric conditions which obtain in some manufacturing districts in which insulators have to work. No tests are given here, but in this respect a composite material (which often incorporates vegetable and animal substances) can scarcely be expected to compare with porcelain, which is made from rocks of the earth itself.

Twiss Engineering & Transmission, Ltd.
G. W. V. TWISS, M.I.E.E.,
Managing Director.

London, E.C., *May 26th*, 1920.

Mutual Discussion.

My attention has been drawn to the enclosed report published in your last issue with regard to the National Alliance of Employers and Employed. In the section which I have underlined you will note it is stated: "The National Alliance justly claims to be the only organisation which can provide the machinery for a round-table conference of employers and employed."

I feel sure this has been inserted in error, and should therefore be greatly obliged if you would point out in your next issue that the Industrial League and Council, which is engaged in this work, has been in existence since 1915, and is an organisation well known to the public, its presidents being the Rt. Hon. G. H. Roberts, M.P. (ex-Minister of Food), and the Rt. Hon. J. H. Whitley, M.P. (Deputy Speaker of the House of Commons). The primary work on which the Industrial League is engaged is to encourage the establishing of Whitley Councils, which are the effective channels of round-table conferences of employers and employed.

John Ames,
General Secretary,
Industrial League and Council.

London, S.W.1.
May 29th, 1920.

[Why does our correspondent misquote us? The word "justly" does not appear in the ELECTRICAL REVIEW ("Mutual Discussion," May 21st, p. 653). The Alliance is entitled to make any *claim* that it likes. We do not feel called upon to decide which is the more suitable organisation for the purpose indicated; it was for that reason that we omitted the word "justly." All Alliances, Councils, or Leagues that are working to encourage more harmonious relations between employers and employed have our support and cordial good wishes. But why this jarring note of rivalry, evoking the rejoinder "Physician Heal Thyself"? Competition in good works is good; co-operation is better; complete union might be *best*—we do not know.—EDS. ELEC. REV.]

The Policy of the E.P.E.A.

My attention has been drawn to the letter signed by our Mr. W. E. Weston, and I would like to point out that in the opinion of myself and my committee this letter is very ill-advised, and is only the personal opinion of our Mr. W. E. Weston, and in no way represents the policy of my committee.

W. J. Webb,
London District Secretary,
Electrical Trades Union.

London, E.C., *June 1st*, 1920.

"Situations Vacant."

The above heading I have no doubt will be very familiar to most readers of your journal, for it has as long as I remember been famous as the heading of a column eagerly watched and criticised by those in the electrical industry. The criticism is, of course, of a varied nature, and I have known readers who have been highly annoyed and somewhat amused at the scandalously low salaries offered by employers (usually represented by a box number). There have been many letters in your "Correspondence" column pointing out the unfairness to the employé of the Box No. system, and while this is not the point I am getting at, I should like to point out that the employé is as necessary to the State as the employer; each depends upon the other. Therefore it should not be made so difficult for the employé to get comfortably through this life as compared with the employer (generally speaking). For instance, an employé wishes to better himself, or even to change his job; he answers an advertisement, but has to send his history to a Box No. He is expected to do this, and is not allowed to know to whom he has written, and in some cases, if he only knew it, he has applied to his present employer. Then again, after taking this trouble, he frequently hears nothing, and simply wonders where his application landed. I consider that no just mind can consider this matter thoroughly without coming to one conclusion. I will come to my point and suggestion. This point I do not think has been quite so much considered. In some cases an applicant will receive an acknowledgment and an interview; he leaves the employer's office after being treated very nicely, and often given many details of the new duties connected with the post, with a promise that he will in due course hear the result of the interview, and he feels confident that he has given satisfaction, and will get the post. He, however, waits and waits, and hears nothing, the employer not keeping his promise. The applicant is not to know one way or the other. I certainly think an applicant should be informed whether successful or not; I suppose I dare not suggest that he should be given a reason why not successful, although the fact that the employé is never given any satisfaction is responsible for a very serious suspicion which exists to-day amongst the employed that their present employers do not give satisfactory references, or adopt some means to prevent men from leaving their present jobs. If there are no grounds for this suspicion, why cannot some action be taken to remove it? There is no doubt that the suspicion exists. Again, in certain cases employers, after receiving applications, select certain ones and send an official form of application, with details of the vacant post. The employé, to suit the employer, makes a fresh application with further information, and returns it, to hear nothing further one way or the other. I consider these tactics totally wrong and unbusinesslike, and my suggestion is as follows: That these matters should be brought before the Joint Industrial Councils with a view to an agreement being come to, that all applications sent to Box Nos. should be acknowledged by the firm concerned, and the applicant informed whether successful or not, within a reasonable time. I believe very much in the D.J.I.C. idea, and if such matters as these were properly dealt with it would certainly promote the purpose of Industrial Councils, and in this particular case would soon do away with the Box No. principle. In conclusion, I give two extracts from the Whitley scheme:—

1. To make and consider suggestions for securing a permanent improvement in the relations between employers and workmen.

2. To recommend means for securing that industrial conditions affecting the relations between employers and workmen shall be systematically reviewed by those concerned, with a view to improving conditions in the future.

J. C.

[We refer to this matter in our leading columns.—EDS. ELEC. REV.]

The Efficiency of Domestic Electric Heating.

I was extremely pleased to see Mr. G. W. Stubbings's article under the above heading, because, far more important than that a truer aspect of the question should have been set forth than that placed before the public by the gas companies, is the understanding of the subject by all those who deal in the apparatus, and this can only be obtained by thorough discussion and an earnest attempt on the part of your readers to understand the meaning of the figures, and not just to skim them over and take them for granted.

I am sure that Mr. Stubbings will forgive me if I say that although he refers to a series of articles, he practically only deals with one (the first); for the second article corrected the efficiency of the gas oven from 13.6 per cent. to 7.4 per cent., while the third pointed out that the taking of 4 cwt. of coke as the net amount of coke available for sale after treating 1 ton of coal was due to the gas companies' error, and should be 8 cwt.

If Mr. Stubbings had devoted the same earnest attention to the second article that he did to the first he would have seen that this is a much fairer method of comparing the two systems, as it allows for gas and electricity for lighting purposes, and, of course, the use of percentages in this connection is impossible, as there is no standard from which to calculate the efficiency of either system.

If articles two and three are considered together it will be apparent that electricity produced at an efficiency of 20 per cent. will do, with coal of a thermal value of 16.4, what gas requires coal of a thermal value of 34.8 to do, and this figure allows the total potential value of the coke and tar to be deducted. The actual value of the coal used by the gas companies would be 58.24, and the gross value of the coke and tar products 22.624.

When I stated that I had a doubt of the possibility of the whole of the coke being utilised, I thought I made it clear that I was not questioning the 60 per cent. efficiency whether the coke was used for domestic or industrial heating. The point is that industry at present absorbs practically all the coke it can, while if gas engines are to be substituted for electric motors and gas lighting for electric lighting a correspondingly larger make of gas will be made with its con-

Digitized by Google

sequent increased supply of coke, and it is this quantity of whose use I was dubious. If in addition the report of Lord Haldane's Committee and Sir Dugald Clerk's "James Forrest" lecture are studied side by side the matter stands out even more clearly. Lord Haldane's Committee contemplated the substitution of electricity for the stationary engines of this country, and arrived at certain figures for the amount of electricity required and the amount of coal necessary to give that amount. Sir Dugald Clerk takes the figure for the H.P. required, and says that a certain amount of gas would do the work, which could be produced from a certain amount of coal. Ignoring the fact that his figure for the efficiency of production is both wrong and misleading, it will be seen that the substitution of gas engines for stationary steam engines will immediately do away with the largest market for coke; so the comparison should really be made between 16.4 for electricity and 58.24 for gas.

In conclusion, I must say that the reason the 20 per cent. efficiency of production for electricity was taken was that both the B.C.G.A.'s advertisements and Sir Dugald Clerk's lectures selected this figure, and endeavoured to show that even then gas was more efficient, probably with the idea at the back of their minds that if gas is better than electricity when it can be produced at a 20 per cent. efficiency, how much more so must it be at the present time?

B. S. Klemens.

London, S.E.
May 31st, 1920.

BUSINESS NOTES.

Dr. Arnold's New Steel.—According to the *Times*, Dr. J. O. Arnold, who was formerly Professor of Metallurgy in the Univerity of Sheffield, has sold his production rights in the new high-speed steel invented by him to Mr. J. D. Moffat, one of the directors of Sir Thomas Salter Pyne & Co., and the new steel is to be made in Sheffield.

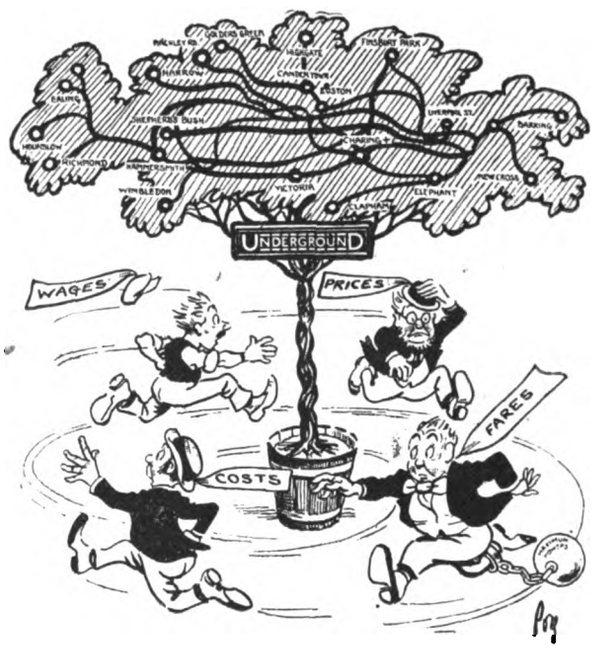
A T.E.T. Dinner.—On Thursday last week the first annual dinner of the TWISS ENGINEERING AND ELECTRIC TRANSMISSION, LTD., was held at the Criterion. The chairman, Mr. Oscar Andersen, presided, and was supported by Mr. G. V. Twiss, managing director, Mr. S. G. Leech, Mr. Rex Andersen, and other members of the firm. Proposing "The Company," Mr. J. Davie congratulated the directors on having laid a sound foundation for their business, and referred to the unfair incidence of the excess profits duty as between old firms and new ones. In responding, Mr. Twiss agreed that legislation which tended to retard the progress of young concerns was contrary to the interests of the country as a whole. Over a year ago he saw that the necessity of cheap power, involving the centralisation of generating plant, would lead to the erection of cross-country overhead mains, and the company, which would be known as the "T.E.T.," was formed for that purpose; it was now carrying out the biggest scheme of the kind in this country, in the North Wales district, as well as many other transmission schemes both at home and abroad, a very creditable result for one year's working, and that not a favourable year for industrial enterprise. They had started at the psychological instant, and their prospects were so good that Messrs. J. B. Saunders & Co. and Messrs. Laing, Wharton & Co. had joined hands with them. They had laid the foundations, and were now ready, with a well-organised staff, to erect upon them a worthy superstructure; they were doing work which would help to rehabilitate the country and improve social conditions. Mr. H. P. Allison, works manager, proposed "The Guests," for whom Mr. C. O'Malley responded, describing Mr. Twiss as himself a "live wire," who inspired those around him with his own enthusiasm for work. Proposing "The Personnel," Mr. Twiss said the success of the company was largely due to the co-operation and *esprit de corps* of the personnel, from the chairman downwards. The company was employing its full share of ex-service men, and Mr. R. C. Andersen had gained the Military Cross. Their duty was not first to make profits but rather to render service to the country, and in return for such service to receive profits whereby they would be able to continue that service in an ever-increasing manner: the motto of the company would be "Service First." They intended to raise abroad the standing of this country in the transmission of power. After Mr. Davie, at the request of Mr. Twiss, had described the profound impression of British predominance which he had gained during his recent travels on the Continent, Mr. S. G. Leech responded, expressing full confidence in the future of the company and in its founder—provided that the latter did not work himself to death. After the health of "The Chairman" had been duly honoured and acknowledged, the very successful and enjoyable function came to a close at a late hour.

Siemens Lamps and Supplies.—MESSRS. SIEMENS BROS. AND CO., LTD., inform us that they are taking over the lamp and supplies department of Messrs. Siemens Bros. Dynamo Works, Ltd. Contemporaneously with this change, the company is making provision for a largely increased output in metal filament lamps, and it is announced that henceforth these lamps will be sold by the company under the distinctive trade name of "Xoel." This trade name will apply to all types of metal filament lamps manufactured by the company, which include the following:—Standard vacuum lamps, half-watt lamps, automobile and battery lamps (vacuum and gas-filled), helical filament traction lamps. As from June 1st, 1920, Messrs. Siemens Bros. & Co., Ltd., will conduct the business in lamps and supplies from the same addresses in London and the provinces as hitherto, where, in addition to fittings and lighting supplies, attention will be given to inquiries regarding the whole of the material manufactured by the company at its Woolwich Works, such as wires, cables, Stannos wires, telephone and telegraph apparatus, fluid and dry cells, flashlight and torch batteries, &c. The company's showrooms at 38-39, Upper Thames Street, London, E.C., have been redecorated and refitted, and all *bonâ fide* trade buyers are invited to call. We are asked further to remind the trade that the advice of the Illuminating Engineering Department of the company is at the disposal of contractors to assist them in the development of any lighting schemes which they may have in hand.

Power Station Firemen.—Firemen employed in the Liverpool, Birkenhead and Wallasey power stations, are claiming advances through their Trade Union, the National Amalgamated Union of Enginemen and Firemen. Strike notices had been issued to the Birkenhead Corporation, but have been suspended, on a meeting being promised.

The Development of Derby.—The Derby Borough Development Committee, having come to the conclusion that there is nothing so effective as publicity, is arranging with Mr. E. J. Burrows, of Cheltenham, for the issue of a handbook advertising the town at a cost not exceeding £50. The Committee is also contributing £5 towards the cost of an advertisement of Derby and its electricity undertaking in the ELECTRICAL REVIEW.

Round and Round.—We reproduce herewith a very telling cartoon issued by the London Underground Electric Railways illustrating the dangerous and frantic chase that is taking place round and round the vicious circle. The educational effect of such posters upon the public mind should be considerable; the



principal object, of course, is to show the railway and tramway passenger how handicapped are the authorities by the chain and deadweight of "maximum powers" restricting fares and preventing them from catching up either costs, wages, or prices.

The following verses accompany the picture:—

ROUND AND ROUND THE UNDERGROUND TREE.

Here we go round the Underground Tree,
I chase you and you chase me,
Round and round—and so you see,
Nobody gets any further.

Round and round and round we tear,
Cost and Price and Wage and Fare,
With never a chance of "getting there"—
And other folks all cry "Murther!"

Round and round we race, in case
Someone behind should force the pace!
Oh, what an endless, senseless chase!
Oh, what a helter-skelter!

Round and round and roundabout,
Starting again where we first set out;
One of these days we'll stop, no doubt,
Under the Tree for shelter.

J. H. R.

Social.—The termination of a popular series of social evenings held by Pope's Social Club throughout the winter was marked by a successful Whist Drive and Fancy Dress Ball held on May 19th, at which Mr. Stanley Carman, works manager, Pope's Electric Lamp Co., Ltd., was present. There were many striking costumes to be seen among those worn by the 600 members and friends who attended, one of the prize winners being Miss Nunny, who represented an up-to-date "Pope" electric lamp. At the close of the proceedings Mr. E. A. Marx (sales manager) distributed the prizes.

London Coal Prices.—In a written reply to Captain Bowyer. Mr. Bridgeman states that the present maximum retail price of best Derby coal in Central London is 57s. 2d. per ton, as compared with 27s. per ton in 1913. He gives the following analysis of these prices :—

	1913.	1920.
	s. d.	s. d.
Pit price	13 0	33 5
Railway rate	6 4	8 2
Wagon hire	1 0	1 6
Factorage	—	0 4
Distribution charges :—		
Wages, loaders, and carmen	1 10	4 9
Other cartage charges, including sacks	1 1¾	3 7
Loss on smalls	0 4	0 7
Establishment charges, including siding rent ...	2 5½	3 4
Management and interest	—	0 3
Profit...	0 10¼	1 3
	27 0	57 2

—*The Times.*

A Swedish Company.—The directors of the A. B. Luth and Rosen, of Stockholm, reporting on the year 1919, state that a considerable set-back took place in the electrical industry as compared with the favourable situation which prevailed in 1918. The reaction specially affected the company, as large stocks of raw materials were purchased on account of the great influx of orders in 1918. In the accounts for 1918 these stocks were entered at the prices of purchase, which also corresponded with the market prices which existed at the beginning of 1919. The great and rapid fall in prices during 1919, however, rendered it necessary for the stocks to be written down considerably. A circumstance which contributed towards this loss was that the company, as in the case of other Swedish electrical firms, could not help participating in the purchases of copper made through the Government's Industrial Commission. The sudden legislation concerning the prohibition of iron-zinc conductors for electrical purposes also brought about a loss of 500,000 kr. Moreover, the losses were contributed towards partly by export difficulties and partly by the decline in the home demand in the latter half of the year; the removal of mechanical manufactures to the Eskilstuna branch, so as to provide greater space for electrical production at the head works in Stockholm, also affected the results, as also did the lack of success with the heating element according to the Cardellska patents, and with a new type of motor-plough. In addition, the manufacture of electrical machinery at Stockholm proceeded with less favourable results, owing to labour conditions and the difficulties in the question of materials. The prospects at present (May), however, seemed to be brighter. All the shops were well supplied with orders, prices were steadily advancing, and the deliveries of materials were more certain, so that it was no longer necessary to keep large stocks. During the year the company were successful in forming some new export connections, and the directors hoped that this part of the business would be carried on satisfactorily, especially if exchange conditions became regular. The accounts show a loss of 5,390,000 kr. for 1919, as compared with net profits of 2,960,000 kr. in the previous year, on a share capital of 16,650,000 kr. It is now proposed to reconstruct the company by the formation of a new company, under which the loss will be written off, and one new share be offered for two old shares, and cumulative preference shares for 4,000,000 kr. are to be issued.

Dissolutions and Liquidations.—British Electrical Accessories, Ltd., Fawcett Row, Bradford. List of creditors in this voluntary liquidation :—

Albion Electric Stores	£234	Bankers	£2,215
Accumulators, Ltd.	19	Lund, Miss	355
Benjamin Electric, Ltd. ..	109	Lund, Percy, P. Lund, Humphries	234

Jarrett, Pyrah & Armitage ..	53		

Signal Electric Co., Ltd., Norfolk House, Laurence Pountney Hill, Cannon Street, London, E.C.—A meeting of the creditors of the above was held recently at the Cannon Street Hotel, when it was reported that the shareholders had passed the usual resolution in favour of voluntary liquidation, and had appointed Mr. G. L. Wynn to act as liquidator. A statement was presented showing the position as at May 5th last, and this disclosed unsecured liabilities of £3,152. The indebtedness to the trade was £2,380, while the directors were shown as creditors for fees amounting to £637, and the balance of £134 was due in respect of interest on the preference shares. The assets were estimated to realise £3,937, and as regarded the unsecured creditors a surplus was shown. The assets consisted of cash in hand, £4 18s. 8d.; deposits, £10; furniture, £32; plant at Walthamstow, £44 13s.; patents, trade marks, and secret processes, £2,388; preliminary expenses, £200; and stock at factory, at cost, £1,262. The issued share capital of the company was £5,160, and as regarded the contributories there was a deficiency of £4,375. The company was registered on May 31st, 1919, with a nominal capital of £12 500, divided into 10,000 preference shares of £1 each, bearing interest at the rate of 7 per cent. per annum, and 5,000 ordinary shares of 10s. each. The company had issued 3,402 preference shares for cash, but there were unpaid calls of £125, leaving the net amount received by the company at the sum of £3,277. The company had also issued 3,766 ordinary shares, and the total issued capital was, therefore, £5,160. The company had worked at a factory in Walthamstow, and there was some doubt whether the lease of the premises had been secured. The lease had about 14 years to run, at a rental of £470 per annum, and a portion of the premises was sublet at £300 yearly. The chief director of the company was Mr. C. St. John, who transferred the patents, &c., to the company. It was impossible to say what their present value was. A portion of the stock had not been made up, and might have to be completed by the liquidator. It was also stated that there were contracts still running, and it might be that the liabilities would be increased. The opinion was expressed that the creditors should be represented in the liquidation of the company, and it was decided that an application should be made to the Court for the appointment of Mr. E. H. Hawkins, of Messrs. Poppleton, Appleby & Hawkins, 4, Charterhouse Square, E.C., as liquidator of the company, while a committee of three of the principal creditors was also nominated. The following are creditors :—

Fish & Ludlow, Ltd.	£602	British Insulated and Helsby Cables, Ltd.	£63
Dangerfield, W. & J.	395	Brownrigg, H. K.	45
Abbey Industries, Ltd.	218	Gilson, D., & Co.	29
Cartland, James, & Sons, Ltd...	168	Baker, W. E.	24
Phillips, Ephraim	164	Norman, L...	24
Drycells, Ltd.	113	Druitt, H.	21
Lovelace, R. E. H.	112	Bailey, S. A.	20
Walthamstow Urban District Council (rates) ..	99	Flint, C. D.	17
Concordia Elec. Wire Co., Ltd.	81	Lea Bridge Gas Co.	14
Matthey, Johnson, & Co., Ltd.	79	St. John, C.	12

Little Wonder Battery Co., Ltd.—Winding up voluntarily. Liquidator, Mr. R. G. Pye, 26, Budge Row, E.C. Meeting of creditors, June 8th.

Siebe, Gorman & Co., Ltd.—Particulars of claims must be sent to the liquidator, Mr. R. B. Petre, 11, Ironmonger Lane, E.C., by June 30th.

Rotasphere Co., Ltd.—Claims must be sent to the liquidator, Mr. A. S. Jopp, 82, Belvedere Road, S.E., by June 22nd.

Ernest King & Co., electricians, engineers and contractors, 97, Bridge Street, Walsall.—Messrs. S. Birch, P. H. Tomkins and E. King have dissolved partnership. Messrs S. Birch and P. H. Tomkins will attend to debts.

Jenner, Chitham & Co., electrical engineers, 11, Red Lion Square, W.C. 1.—Mr. H. Jenner and Mr. R. M. Chitham have dissolved partnership. Debts will be attended to by Mr. H. Jenner, who will continue the business at the same address under the style of H. Jenner & Co.

British Trade-Mark Applications.—Appended is a summary of the recent applications for British trade-marks in respect of goods associated with the electrical trades and industries :—

Sollac. No. 400,442. Class 1. Electrolytes, being chemical substances.—Haslam & Stretton, Ltd., 11, Windsor Place, Cardiff. February 5th, 1920.

Quixpark, the Best of Fellows (lettering combined with name and address of firm and design). No. 396,037. Class 6. Magnetos. —Fellows Magneto Co., Ltd, Park Royal, Willesden, N.W. October 23rd, 1919.

E.A.C. (monogram design). No. 401,343. Class 6. Electrical machinery.—Electrical Apparatus Co., Ltd., Vauxhall Works, South Lambeth Road, London, S.W., 8. March 1st. 1920.

Elephant on Scooter (design). No. 394 361. Class 13. Electric cut-outs and terminals, electric switches, electric fittings, &c.—Leonard E. Hough, 246, High Street, Lewisham, S.E. August 19th, 1919.

Konled. No. 400,513. Class 13. Electric light and cable fittings.—Faulkner & Co., 5, Market Street, Manchester. February 7th, 1920.

A.E.G. (letters combined with design). No. 359,820. Class 13. Electrical goods of metal.—Allgemeine Elektricitäts Gesellschaft, 2-4, Friedrich Karl Ufer, Berlin, N.W., 10. March 23rd, 1914. (The registration of this trade-mark has apparently been held up during the war, having only just been passed.)

Rajah. No. 401,790. Class 15, also No. 401,791. Class 16. Fittings of glass and porcelain for use in electric lighting, &c.—Herbert & James Stevenson, Ltd., 16, Water Lane, Great Tower Street, London, E.C. March 12th, 1920.

Boreas. No. 398,548, Class 18. Electric and pneumatic bells (as systems in buildings, &c.).—Lacy-Hulbert & Co., Ltd., 91, Victoria Street, London, S.W. December 18th, 1919.

Electrical Exhibition in Holland.—The British Vice-Consul at Leeuwarden, Holland, reports that an exhibition of electrical products will be held by the municipality of that town from August 14th to September 15th, 1920. The Vice-Consul, who is chairman of the Executive Committee, suggests that United Kingdom firms should unite to make up a British Section for which it is possible to allocate a space in a favourable position. A translation of the official regulations has been prepared, and is available to callers at the D.O.T. in London, in Room 48 (Mr. Cresswell).

Catalogues Wanted.—The Electrical Engineering and Maintenance Co., 87, Main Street, Portrush, desire to receive catalogues and other publicity matter.

Digitized by Google

Lead.—In their report, dated May 29th, MESSRS. G. CAWSON & Co. say :—

The general consumptive trade still remains rather stagnant. Electrical works, however, continue busy, and are taking good quantities of lead, and appear likely to do so for some considerable time. This demand keeps the market firmer than it otherwise would be.

Supplies continue to come in rather freely, so that there need be no alarm on the part of consumers as to any shortage. With general consumptive demand at about 50 per cent. below the pre-war normal, we cannot see how any shortage in supplies is likely to arise.

The outlook points to a steady market, and should speculators again begin operations, as other metals appear to be reviving, some fresh advance in price is not unlikely.

MESSRS. JAMES FORSTER & Co., reporting under the same date, say :—

The metal market continues under the depressing influence of outside markets and finance, supply and demand having very little to do with the course of values. Consumers generally have been buying with hesitation and only for near delivery, but towards the week-end there has been much more disposition shown to negotiate, and inquiries have been received from different parts of the country which have resulted in business at considerably above the market rates.

The difficulty in obtaining suitable brands is again in evidence, but this has been relieved somewhat by the discharge of steamers this week from Australia, after lying in the docks in one case for over two months and in others for weeks. The shipments from Australia for April are advised at 2,300 tons, against arrivals here in April from this source of 5,750 tons, so that June will be a short month for Australian brands.

Italian Company Notes.—There has been formed at Milan the Consorzio per l'Alienazione degli Impan e Materiali Elettrici e Telefonici Residuati della Guerra with a capital of 5,000,000 lire, of which 1,570,000 lire are paid up, for the liquidation of war plant.

With a capital of 6,000,000 lire the Società Anonima Elettrica Ghise e Acciai has been established at Genoa for the output of electric current for the production and trade in malleable iron and special steel and other industrial purposes.

The Società Anonima Elettricità Alta Italia, of Turin, has decided to increase its capital from 30,000,000 to 48,000,000 lire, a portion being allotted to the Società S.I.P. for its Biellese distribution network.

Other companies increasing their capitals are :—The Società Idroelettrica Monviso, at Verzuolo, from 5,000,000 to 20,000,000 lire ; the Società Italiana per l'Utilizzazione delle Forze Idrauliche delle Veneto, at Venezio, from 21,000,000 to 26,250,000 lire ; the Società Elettrica Bresciana, at Brescia, from 36,000,000 lire to a sum unnamed ; the Società Emiliana di Esercizizi Elettrici, of Parma, from 10,500,000 to 17,500,000 lire ; the Società Materiali Elettro-Trazione, of Florence, from 1,000,000 to 2,430,000 lire ; the Società Elettrica Radio di Sperone, of Avellano, up to 1,000,000 lire ; the Società Iesina di Elettricità, of Iesi, from 800,000 to 1,200,000 lire ; the Società Imprese Elettriche, of Macerata, from 1,200,000 to 1,500,000 lire ; the Società Industrie Elettriche Calabresi, of Radicena, increases from 2,000,000 to 3,000,000 lire, and amalgamates with the Società Elettrica Ionica, of Siderno ; and the Società Fabbrica Apparechi Riscaldamento Elettrico, of Milan, from 2,000,000 to 5,000,000 lire.

The Officina di Energia Elettrica, of Novara, has reduced its capital from 2,000,000 to 800,000 lire by assigning to its shareholders 8,000 12-lire shares of the Società Padana di Elettricità for one of the Officina.

Book Notices.—"The Problem of Dock Labour." By Arthur Shadwell, M.A., LL.D. Reprinted from *The Times*. London : Longmans, Green & Co. Price 1s.—This is a most thoughtful and valuable pamphlet. Every student of the pressing social and industrial problems of these critical times should secure a copy and read it carefully.

"Industrial Arts Index." Vol. VIII, No. 4. April, 1920. (62 pp.). New York : The H. W. Wilson Co.—A comprehensive index to articles which have recently appeared in engineering, trade and business periodicals, placed under subject-headings.

"Welfare Work." Vol. I, No. 5. (16 pp.).—The May number of the *Journal* of the Welfare Workers' Institute contains articles by E. D. Newcomb, "Foremen and Forewomen," and A. Rowland-Entwistle, "The Democratisation of Industry."

"Armature Winding and Motor Repair." By D. H. Bradymer. Pp. xxi + 515 ; figs. 298. London : Hill Publishing Co., Ltd. Price 18s. net.

"Engineers' Desk-Book and Diary." 1920. Leeds : Trades Publicity Co.—This handy publication contains a brief calendar, a diary giving ample space for notes and 96 pages of indexed information of a comprehensive character, including trade statistics and legal notes, as well as a small railway map of the British Isles.

"Ozone." By E. K. Rideal. Pp. ix + 198 ; 24 figs. London : Constable & Co., Ltd. Price 12s.

"Questions and Solutions in Telegraphy and Telephony." By H. P. Few. London : S. Rentell & Co., Ltd. Price 5s. 6d.—This useful handbook is now in its fifth edition—the last was published in 1914. It has been brought up to date by the addition of the papers and solutions of the City and Guilds of London Institute in Grade I of Telegraphy and Telephony for the last five years. Although the papers given in the first part of the volume no longer represent current practice, they are retained as illustrative of the various steps of progress.

"Induction Coil Design." By M. A. Codd. Pp. viii + 238 ; figs. 165. London : E. & F. N. Spon, Ltd. Price 21s. net.

"*Journal* of the Institution of Electrical Engineers." Vol. LVIII, No. 291. May, 1920. London : E. & F. N. Spon, Ltd. Price 10s. 6d.—The May issue contains the following papers :—"Scientific Management : A Solution of the Capital and Labour Problem," by Capt. J. M. Scott-Maxwell ; "Wireless Telephony on Aeroplanes," by Major C. E. Prince ; and "The Protection of Alternating-Current Systems without the use of Special Conductors," by Major K. Edgcumbe.

"Science Abstracts" (A and B). Vol. XXIII, Part 4. April 30th, 1920. London : E. & F. N. Spon, Ltd. Price 2s. 6d. each.

"The Peat Resources of Ireland." (25 pp.). A lecture given before the Royal Dublin Society on March 5th, 1919, by Prof. Pierce F. Purcell. London : H.M. Stationery Office. Price 9d. net.—This is described in a prefatory note by the Director of Fuel Research as "a clear and fair-minded exposition of the situation . . . written by an expert with a wide and intimate knowledge of the subject." The first part of the lecture is devoted to a description of the various forms and characteristics of peat deposits, and then the elimination of water, which forms the greater part of bog peat, is dealt with. Figures of the present-day consumption are given, as well as an estimate of the quantities available—a figure of 3,700 million tons of anhydrous peat. Tables comparing the peat and coal deposits of Ireland and the areas of the peat deposits of the world are included. The various methods of winning peat are described, and the production of power from this fuel is illustrated by an efficiency diagram.

"The Motor Ship." Vol. I., No. 3. (30 pp.). London : Temple Press, Ltd. Price 1s.—The June number of this well-produced and highly illustrated journal contains an interesting description of the 10,000-ton motor-tank ship *Narragansett*, built by Messrs. Vickers. The largest American motor-ship is also described among other informative articles.

"Vickers News." Vol. II, No. 17. June 1st. (20 pp.) London : Vickers, Ltd.—Presenting articles on "Trans-Continental Flying," "Transformers in Collieries," "A Simple Form of Refrigeration," &c., all well illustrated.

Bankruptcy Proceedings.—A. E. CHANNON, H. S. NADIN, and C. G. CHANNON (trading as A. E. Channon & Co.), electrical engineers, 8, Orrisdale Terrace, Cheltenham, and 425, High Street, Cheltenham.—The public examination of these debtors was held on May 27th, at the Court House, Cheltenham, before Mr. Registrar Williams. In reply to the Official Receiver, the debtor, H. S. Nadin, stated that he had acted as managing partner, and that the partnership commenced in January, 1919. He had had various occupations before commencing in partnership. They started business without any stock or capital. They had an offer of goods up to £250 on credit. The Official Receiver stated that the business had been carried on at a loss, owing to want of business knowledge, want of capital and negligence in book-keeping. Debtor admitted several losses on contracts which partly accounted for their deficiency. He also admitted that a statement prepared and sent to one of the creditors was misleading, though he suggested that he did not know it at the time. This creditor, who had removed debtors' goods just before the petition to the value of £200, had now written to the Official Receiver, that these goods were now held at the Official Receiver's disposal. The debtor, A. E. Channon, generally agreed with the answers given by the previous partner. He declared that by a deed made in September, 1918, he gave all his furniture to his wife, but the Official Receiver remarked that the wife had now withdrawn her claim. C. G. Channon was also examined as to the conduct of the business. On the application of the Official Receiver, the examination of the debtors was adjourned : meanwhile, Nadin was ordered to furnish a cash account of receipts and payments during the partnership.

W.P. O'REILLY, manufacturing electrician, 397, Edgware Road, and Old Broad Street, E.C.—Last day for proofs for dividend June 18th. Mr. D. Williams, Official Receiver, trustee, Carey Street, W.C.

Trade Announcements.—The offices of the PENINSULAR ENGINEERING CO., LTD., have been removed to Amberley House, Norfolk Street, Strand, W.C. 2. Telephone number unchanged. Telegrams "Pensuleco Estrand London."

THE HACKBRIDGE CABLE CO., LTD., have now closed down their London offices, and all communications should be addressed to the company at Hackbridge, Surrey.

THE METROPOLITAN-VICKERS ELECTRICAL CO., LTD., have removed their London office from Norfolk Street to No. 2, Central Buildings, Westminster, London, S.W. 1.

Mr. Farmer, electrical engineer, of Broadhurst, Skelmersdale Road, Clacton-on-Sea, has entered into partnership with Mr. C. R. Small & Wall Bros., and the firm will trade as THE CLACTON ELECTRICAL CO.

THE TWISS ENGINEERING & ELECTRIC TRANSMISSION, LTD., announce that they have now concluded arrangements whereby they acquire the Transmission Line Contracting Department of Messrs. J. B. Saunders & Co., Ltd., which will therefore become incorporated in the company's organisation, together with the services of Mr. S. G. Leech, M.I.E.E., as the director of contracts, with a staff of erecting engineers, linesmen, &c. The Twiss Engineering & Electric Transmission, Ltd., are also expanding their works at Mildmay Park, and laying down new plant to facilitate the manufacture of transmission line material. The directors have also decided to simplify and shorten the name of the company by the deletion of the words "engineering and," and the necessary formalities having been completed, the name of the company will in future be : Twiss Electric Transmission, Ltd. The head office remains at 62/63, Queen Street, E.C. 4. The capital of the company has been increased in order to deal with the increasing volume of business.

MR. THOMAS J. DIGBY, electrical engineer and contractor, has removed his offices and stores to 12, Gerrard Street, London, W. 1.

The address of MR. JAMES FERGUSON, electrical instrument maker and engineer, has been changed to Stepps Engineering Works, Stepps Road, Glasgow.

MESSRS. DOWNES & DAVIES, of Liverpool, have removed their Manchester offices and stores to 25/27, Faulkner Street, City.

Digitized by Google

Catalogues and Lists.—MESSRS. F. J. SHENTON & CO., LTD., of 68 and 69, Shoe Lane, London, E.C. 4, have sent us a couple of calendar novelties on behalf of Messrs. Flather & Co., Ltd., dynamo and motor manufacturers, of Park Electrical Works, Leeds, for whom they are sole representatives. One takes the form of a glass paper-weight, with changing calendar affixed at base thereof. The other is a daily tear-off date pad for use on the wall; it has bold red figuring.

MESSRS. WARD & CRICHTON, 41, Chapel Walks, South Castle Street, Liverpool.—A booklet and two leaflets dealing with the "Tompkins" Boiler Steam Dryer (Patent No. 113,701), and illustrated by detailed drawings. The agent for Scotland is Mr. I. Ferguson, 27, Oswald Street, Glasgow.

THE COX-CAVENDISH ELECTRICAL CO. LTD., Twyford Abbey Works, 84, Acton Lane, Harlesden, N.W. 10.—"The X-Ray Examination of Materials" (20 pp.), a reprint from the *American Machinist* giving full details and illustrations of the apparatus required for this work. The paper is priced, and directions for treating films are given.

THE OVERSEAS ENGINEERING CO., LTD., 75, Curtain Road, E.C.—List 23, a folder illustrating and describing the "Overseas" electric lighting plant. Full details of working costs are given.

THE J.L. ELECTRIC CO., 30, Church Street, Birmingham.—Particulars and samples of a universal cable clip, to secure cables from 1/·044 single up to 7/20 twin, in C.T.S., lead-sheathed, or armoured types, which can be supplied from stock.

MESSRS. MICKELWRIGHT, LTD., Alperton, Wembley, Middlesex.—Pamphlet illustrating and describing arc and sliding resistances, dimmers, shunt regulators, switchboards, &c.

MESSRS. HIGGS BROS., Dynamo Works, Sand Pits, Birmingham.—"Monthly Magazine," Vol. 2, No. 4, June, 1920 (24 pp.). The present issue contains the usual features, including a stock list of motors and dynamos, and "Hints and Tips," giving notes on turning commutators.

MESSRS. BUCK & HICKMAN, LTD., 2 and 4, Whitechapel Road, E. 1.—An eight-page booklet dealing with machine tools, ganges, &c., and the "Buckman" training centre where prospective purchasers may not only see the desired machines running, but may, in addition, have work of their own operated upon.

THE STERLING TELEPHONE AND ELECTRIC CO., LTD, 210-12, Tottenham Court Road, W.—Publication No. 279, being a revised price list to the eleventh edition catalogue. Catalogue number and prices only are given.

AUTOMATIC AND ELECTRIC FURNACES, LTD., 281-283, Gray's Inn Road, W 1.—Heat Treatment *Bulletin* No. 22, "The Hardness of High-Speed Steel," illustrated by two curves of hardness tests.

Japanese Financial Crisis: Shipment of Goods.—The *Bulletin* of the F.B.I. this week contains the following notice:—"In view of the present financial crisis in Japan, members who are in doubt as to their position in connection with goods for shipment to that country are advised to communicate in the first instance with the Japan Section, Overseas Trade Organisation, F.B.I., 39, St. James's Street, S.W. 1.

Auction Sale.—By direction of the Disposal Board, Ministry of Munitions, MESSRS. OLIVER APPLETON & KITCHEN will sell by auction, on June 15th and following days, at the C.D.S. stores, Benbow, near Leeds, a quantity of electrical plant, fittings, engines, Lancashire boilers, machinery, and miscellaneous stores, &c. For particulars, see our advertisement pages to-day.

Manchester Turbo-Generators.—At the annual meeting of shareholders of MESSRS. RICHARDSONS, WESTGARTH & CO., LTD., held at Hartlepool on Monday, Mr. D. B. Morrison, who presided, said a notable contract in the "land" department of their engine works was a 25,000-KW. electric generating set for Manchester, of which they supplied the turbine and condensing plant and Metropolitan-Vickers the generator. This set was the largest in operation in the United Kingdom, and although the technical requirements were very severe, they had been successfully met, and the plant continued to give highly satisfactory results.

Derby Housing Scheme.—The Derby Town Council has received communications from the Derby Engineering Co. with respect to the wages and conditions of labour of men employed in connection with the electrical work on the municipal housing scheme. It has decided to inform the electrical contractors that they must observe the fair wages clause or the contracts will be cancelled.

Generating Plant for Sale.—Ipswich Corporation Electric Supply Department has for disposal two 80-I.H.P. Reavell high-speed tandem compound engines, direct-coupled to two 24-KW., 230/260-volt D.C. shunt-wound generators; also one 200-KW., 460/520-volt Electrical Co.'s D.C. generator. For particulars see our advertisement pages to-day.

Wigan Corporation Electricity Committee invites offers for one Willans high-speed compound engine (3 S. size), complete with Korting ejector condenser, direct coupled to 560-v. Dick, Kerr generator, &c. See our advertisement pages to-day.

Light-Weight Motors.—Referring to a note under this heading which appeared in our issue of December 13th, 1918, MESSRS. NEWTON BROTHERS (DERBY), LTD., inform us that the machine in question was probably one of their dynamos, as illustrated and described in their "Aircraft Dynamo Electric Machinery Supplement." This machine has an output of 500 watts at 12 to 14 volts, and weighs only 12 lb. Many other types of extreme lightness have been developed by the company for aircraft, vehicle motors, &c.

LIGHTING AND POWER NOTES.

Athlone.—ELECTRICITY SUPPLY.—The total cost of the new electric lighting scheme, promoted by the Urban Council, is now stated to be £20,000, but an estimate for a second scheme amounts to £17,653. The gross financial result is estimated as follows:—Revenue, £4,360; working expenses, £2,082; balance, £2,179; loan charges, £2,000; and net profit, £378. Mr. Kenny, representing Messrs. Tiesney, consulting engineers, said the cost of electricity would be 1s. per unit. For public lighting 120 lamps would be provided. A Committee of the Council is considering the whole matter.

Australia.—NEW UNDERTAKINGS.—A large number of townships in Victoria have schemes for electricity undertakings in hand or under consideration; among these are the towns of Stowell, Avoca, Beaufort, Colac, Mount Gambier, and Kyneton.

Birmingham.—CANAL STRIKE.—The electricity supply department was seriously affected by the recent strike of canal boatmen, as practically the whole of its fuel is water borne. While the strike was in progress, officials and members of the staff undertook the boatmen's work, and in this way a minimum supply of coal was got through to keep the service going. When a tentative settlement was reached, the Corporation boatmen, who had ceased work in sympathy with the other boatmen, resumed their duties.

Bolton.—PRICE INCREASE.—The electrical engineer reported, on May 27th, on the need for increasing the price of electricity. The Committee decided to advance the charge for both lighting and power by a tenth of a penny per unit. The request of the Chamber of Trade for a preferential rate was declined.

Bo'ness.—EXTENSION SCHEME.—Mr. Munro, consulting engineer, has reported to the Town Council on the proposed extension of the electricity works, and a decision regarding this will be made at a meeting of the Council at an early date. The cost of the scheme is given as £40,000.

Burnley.—EXTENSIONS.—On May 27th the chairman of the Electricity Committee reported that tenders had been obtained for the proposed extensions at the electricity supply station and for the installation of the required plant. The lowest tender at the present time was £120,000, and at least 16 months would be required in which to complete the work. The amount would be subject to variation in the event of increases occurring. The £120,000 was made up as follows:—Three water-tube boilers, with superheaters, economisers, valves, &c., £39,200; one 3,000-KW. turbo-alternator, with condenser, pumps, &c., £27,100; external pipe-work and valves, £6,270; water strainer, with motor pump, £577; cooling tower, £5,200; Venturi meters, £232; boiler feed-pump, £473; 1,000-KW. rotary set, £7,097; switchgear, booster, and cables. £6,600; ash-handling plant, £2,200; constructional work, cable and pipe trenches, £12,000; and contingencies, £13,051. It was anticipated that further rises in wages and materials would occur before the completion of the work, and the final cost would be greater than the £120,000.

The Council intends to apply for borrowing powers for the latter amount, and for an additional £20,000 for electricity mains.

China.—SHANGHAI.—Contracts for electrical generating plant for power and lighting are probable in connection with projects for supplying electricity outside the Settlement limits at Shanghai. In the ordinary course the proposed extensions of the electricity department of the Shanghai Municipal Council, as set out in March last, would have covered such requirements, but the extensions have been opposed on the ground that they are for the benefit of mills and factories outside the Settlement limits, which pay no taxes to the Municipal Council. It is probable, therefore, that independent power stations may be erected for such outlying establishments. Already works are being erected in Chinese territory in order to obtain power from the native city station. A way out of the difficulty has been provided by the proposal that outlying factories requiring current for power purposes should take up municipal debentures, but a very general response to this scheme is not anticipated.—*Eastern Engineering.*

Colne.—PRICE INCREASE.—The Town Council has decided to increase the charge for electricity for lighting from 4½d., plus 75 per cent., to 8d. per unit allowed under the provisional order; for power purposes, from 85 per cent. to 95 per cent.; and for heating, from 75 per cent. to 85 per cent. on the scale charge of 1½d.

Continental.—SWITZERLAND.—The Nordostschweizerische Kraftwerke A.-G. (N.E. Swiss Power Works), which increased its capital from 18 million to 36 million fr. in 1918, is now about to effect a further increase of 34 million fr. The following particulars concerning the future development of supply and demand and the construction of new power stations are extracted from the company's report of January 30th, 1920:—

In the financial year 1918-19 production amounted to 232·22 million KW.-hours, as against 185·66 million KW.-hours in 1917-18. It is estimated that requirements for the current year will increase by 13 per cent. As a return of pre-war coal prices cannot be looked for within a measurable time, electricity will be able to compete with coal for many years to come. Its use in the home, for hot water supply, and for metallurgical purposes has increased. The electrification of the railways is proceeding apace. Only for

Digitized by Google

electrochemical purposes has the demand materially decreased and the present stagnation will, no doubt, continue until such time as the products of the industry are in a position to compete with foreign prices.

In view of the fact that the Swiss power stations are unable to cover home requirements, the N.O.K., which is responsible for the electricity supply of North-East Switzerland, is aiming at the construction of new power stations, so as to make the country independent of foreign supplies. It had been hoped that the concession for several small stations in the canton of Glarus would have been granted, but unexpected difficulties have arisen. The concession has, however, been obtained for a low-pressure station in the Canton of Aargau, viz., the Böttstein-Gippingen Power Station. In addition, subject to the sanction of the Administration of the Swiss Federal Railways, the project for the construction and working of the Etzel Power Station jointly by the S.F. Railways and the N.O.K. has been prepared and, finally, it is hoped that the construction of the Wäggital power station can be carried out in conjunction with the town of Zürich.—*Economic Review.*

GERMANY.—According to plans prepared by Mr. Hallinger, of Munich, it is proposed to divert water from the high level rivers in Southern Germany to the low level system of the Main. The fall of the River Lech, for instance, which now flows south and joins the Danube, would be increased from 300 ft. to 1,080 ft., resulting in a total of 500,000 H.P. if arranged with open canals and falls at three points. The first fall would be at Nurnberg, where 200,000 H.P. is obtainable, the second at Wurtzburg, delivering 150,000 H.P., and the balance of 150,000 H.P. at Frankfort, as against 60,000 H.P. if the river is to continue to flow south as at present. Coal-fired installations to produce the same power would require 3,000,000 tons of good quality coal annually, which at the present price in Germany is worth £15,000,000.—*Technical Review.*

AUSTRIA.—A report on the development of water-power and electricity works has been presented to Vienna Town Council.

In view of the present restrictions in the use of electricity and the high prices, the Council was compelled to ascertain the quickest and cheapest method of obtaining water power. In contrast to the length of time required for the Danube power works, the Ybbs and the falls of the Alpine water-system near Kienberg-Gaming, can be developed in three or four years. Also the technical preparation for the Ybbs works are so far advanced that in a few weeks the sanction for proceeding may be expected. The average yearly output of the Danube works would be 140,000 H.P., and of the Ybbs works 18,000 H.P. The cost of the former is estimated at the lowest at Kr. 211 mill. (peace value), of the latter at Kr. 30.8 mill. The production of the electrical works amounts at present to 250 mill. KW.-hours, and will be increased to at least 320 mill. The yearly increase of electrical output averages 18½ mill. KW.-hours, and will in future be still greater because the gas lighting from foreign gas coal is to cease and electricity alone to be used, especially in the largest industrial district of Austria between Vienna and Vienna-Neustadt. A yearly increase of 200 mill. KW.-hours can, therefore, be estimated. In 15 years' time, the earliest date for the completion of the Danube works, the municipal electricity works would be producing 620 mill. KW.-hours. But the Danube works will supply only 365 mill. and the Ybbs works 200 mill., leaving a balance to be supplied by steam. For this reason a large increase of coal production is essential.

It has been decided that Vienna shall establish a co-operative company in which the Province of Lower Austria, the State Railways and the Danube Control Commission will participate, that the commune of Vienna shall proceed with the immediate development of the Ybbs Valley Works, and approach the Government and Lower Austria for active support in this matter.—*Economic Review.*

NORWAY.—Plans are under consideration for the conveyance of electricity from Norwegian waterfalls to Denmark. This would necessitate the construction of a cable about 100 km. in length, extending across the Skager Rack to a point on the coast of Jutland between Hirtshals and Hanstholmen. The longest cable at present in existence connects Helsingborg with Elsinore, a distance of only 7 to 8 km. It is estimated that the total cost of carrying out these plans, including the erection of stations and the extension of the exploitation of the Norwegian waterfalls, would amount to Kr. 30 to 40 million.—*Economic Review.*

SPAIN.—A commission of the Portuguese Ministry of Public Works has arrived in Madrid with the object of drawing up an agreement in connection with the division of power to be obtained from the Douro. It is estimated that a total of 450,000 H.P. is available from this source.—*The Times.*

Derby.—PUMPING PLANT.—Owing to the initial expense, the Town Council has decided not to install electrical pumping plant at the Little Eaton Waterworks.

Dublin.—PROPOSED PRICE INCREASE.—The Corporation has given notice of application made to the Ministry of Transport for an order under the Statutory Undertakings (Temporary Increase of Charges) Act, 1918, to provide that the maximum rates of charge within the municipal area, shall be increased by 50 per cent., viz., from £2 to £3 for any amount up to 60 units, and from 7d. to 10½d. per unit over 60 units, so as to enable the electricity undertaking to be carried on without loss.

STRIKE.—The strike of the Irish railwaymen who object to the importation of arms and ammunition extended on May 27th to the L.N.W.R. power house employés. This station not only supplies the power for cranes, &c., but also for lighting the railway hotel.

Dungarvan (Co. Waterford). — ELECTRIC LIGHTING SCHEME.—A representative public meeting has approved a scheme for public electric lighting, the power to be derived from the Colligan river. Nearly half the required capital (£11,000) was promised at the meeting.

Halifax.—SLIDING SCALE.—The Tramways and Electricity Committee has decided that as from the last meter reading taken for the June quarter, the following clause in the power supply agreement shall apply to all power consumers of electricity, viz.:—"If in any quarter the average price of coal (pea slack) delivered at the Corporation's electricity works is above or below 8s. per ton, the price per unit to be paid by the consumer shall during such quarter, be increased or reduced by 2½ per cent. for every 6d. or portion of 6d., provided, however, that no such increase or reduction shall be made or allowed unless the average price of coal exceeds 9s. per ton, or is lower than 7s. per ton."

Heston and Isleworth. — YEAR'S WORKING. — The report upon the electricity undertaking for the past year shows that the sale of energy produced was £21,721, against £17,019 for the previous year; meter rents realised £284, against £255; and public lighting £2,140, against £1,368. Fuel cost £8,926, compared with £6,557; and wages rose to £2,009 from £1,559. A profit of £442 was made, this being £6 above the previous year's figure.

Japan.—HYDRO-ELECTRIC SCHEMES.—The organisation of the Hida-Gawa Electric Co. now under consideration is for the development of power from the Hida River, in the vicinity of Nagoya. An alternative scheme aims at the unification of the power supply of Nagoya and neighbouring districts under the control of the Nagoya Electric Light Co., which has bought half of the shares of the Bishu Electric Co., and is negotiating to secure control of the Ichinomiya Electric Light Co., the Inazawa Electric Co., the Gifu Electric Co., and the Yokkaichi Electric Co. As a result of the efforts of the governor, representatives of six big electrical companies in Miye Prefecture, the Hokusei, Iwakura, Tsu, Matsuzaka, Ise, and Toba, have been in consultation with regard to a possible combination of all the electrical companies within the Prefecture. With the double purpose of obtaining additional income and of controlling water rights, the authorities of Toyama Prefecture are contemplating the establishment of a large hydro-electric plant under Prefectural administration, to develop 37,000 KW. from the Joganji River. It is expected that this will be sufficient to supply all present demands for power within the Prefecture and leave a surplus to be sold to Kyoto and Osaka. Another power company recently organised in this district is known as the Etchu Electric Power Co., having been granted a licence to utilise the Wada River, from which it is expected to develop 10,000 KW.—*Eastern Engineering.*

Liverpool.—PRICE INCREASE.—An addition of 25 per cent. on the present charges is to be made after June 30th. This will not apply to charges based upon the cost of coal, and subject to adjustment according to increases or decreases. These will only be increased by 15 per cent.

London.—HAMMERSMITH.—The Electricity Committee strongly recommends the laying of mains for the supply of electricity to the new housing estate. The total cost is estimated at £27,000, including services. The system of charging favoured is the prepayment meter, the fixed price and limiter systems being considered a restriction upon the use of electricity for other than lighting purposes, while the Committee wishes to encourage the employment of the supply for all domestic purposes in order to cover the initial expenditure in a short time. If a tenant prefers an ordinary meter, this may be installed in lieu of a prepayment meter. Tenders are being invited for the erection of the first of the sub-stations required under this supply scheme.

Owing to increased costs, the estimated surplus of £3,582 at the end of March, 1921, will be changed to a deficit of £13,688 unless prices are increased immediately; and the Electricity Committee, therefore, proposes the following increases, to take effect from July 1st:—Lighting to be raised to 7d. per unit, and all supplies for power, heating, cooking, and industrial purposes to be increased by a further 50 per cent., bringing the prices up to double the pre-war rates.

The Works Committee recommends the purchase and conversion of 73 gas-lamp standards to electricity, at a total cost of £755. It is stated that the present yearly maintenance cost is £5 8s. 9d. per lamp, which will be reduced upon conversion to £3 18s. 1d.

SHOREDITCH.—The Electricity Committee deems its desirable to abolish the present system of charging for electricity which consists of adding percentages to the pre-war rate. A revised scale, to take effect from the June meter readings, is proposed as follows:—Lighting—maximum demand, 8d. for the first 1½ hours daily, and 3½d. per unit for all electricity consumed thereafter. Flat rate, 6½d. per unit; theatres and music halls, 6d.; and outside arc lighting and electric signs, 4d. per unit. Heating—1½d. per unit if taken in conjunction with a lighting supply. Power—30s. per quarter per E.H.P. of maximum demand, plus 1½d. per unit (maximum charge, 2¾d. per unit). A special rate of 4d. per unit for trade and testing purposes is also proposed. Discounts varying with the amount consumed from 2½ to 10 per cent., are to be allowed. A new scale of meter rents is being introduced at the same time.

Lurgan (Co. Armagh).—ELECTRICITY SUPPLY.—Just before the war, the firm of Messrs. Wanside & Co., Belfast, submitted an electric lighting and power scheme to the Urban

Digitized by Google

Council, but the war intervening, the scheme was postponed. Mr. Pleasance, of the firm, recently waited on the Council and explained the great increase in the cost of production since 1914, and, as a result of the discussion, the firm was asked to bring the 1914 scheme up to date and re-submit it.

Mid-Lancashire.—Electricity District.—The Electricity Commissioners have provisionally determined that the undermentioned area shall be constituted a separate electricity district for the purposes of the Electricity (Supply) Act, 1919, that is to say:—The county boroughs of Blackburn, Blackpool, Burnley and Preston. The boroughs of Accrington, Bacup, Chorley, Clitheroe, Colne, Darwen, Haslingden, Nelson and Rawtenstall. The urban districts of Barrowford, Brierfield, Church, Clayton-le-Moors, Croston, Fleetwood, Fulwood, Great Harwood, Kirkham, Leyland, Longridge, Lytham, Oswaldtwistle, Padiham, Poulton-le-Fylde, Preesall, Rishton, St. Annes-on-Sea, Thornton, Trawden, Walton-le-Dale and Withnell. The rural districts of Blackburn, Burnley, Chorley, Clitheroe, The Fylde, Garstang and Preston. It being apparent to the Electricity Commissioners that the existing organisation for the supply of electricity in the district so provisionally determined should be improved, notice is further given that they intend to hold a local inquiry into the matter. Objections or representations may be made not later than September 30th, 1920.

Morley.—Year's Working.—The seventeenth annual report covering the year ended March 31st, 1920, shows that the total revenue for the year was £7,834, an increase of £2,907 on the previous year's figure. The total expenditure increased by £877 to £5,413, leaving a gross profit of £2,421. The net result, after payment of interest, &c., was a credit balance of £282, which, compared with a deficit of £1,759 for 1919-20, was very satisfactory. The report states that the plant is often subjected to overloads owing to its inability to meet the requirements of consumers. There is no reserve in case of a breakdown, and many applicants are waiting to be connected. Unless additional plant is installed before next winter it will probably be necessary to restrict the consumption of power during certain hours.

Plymouth.—Year's Working.—The recently-published accounts for the year ended March 31st last show a total income of £92,957, against an expenditure of £69,785, and a gross profit of £23,172. The net result, after the payment of loan interest, &c., was a credit balance of £274, comparing favourably with the loss of about £2,000 on the previous year's working.

Rotherham.—Price Increase.—The Town Council has increased the charges for electricity as under as from the June 1st quarter:—Power and heating, to 100 per cent., and lighting to 50 per cent. above the pre-war rates.

Swansea.—Strike.—A lightning strike of power-house workers, on Wednesday last week, caused the suspension of electricity supply to the docks.

Worcester.—Year's Working.—The accounts of the city electricity undertaking for the year ended March 31st show a total income of £33,116, compared with £32,235 for 1918-19. The cost of generation and distribution of electricity was £19,835, leaving a gross profit of £13,280. After payment of interest, redemption of capital and income-tax, there remained a profit of £1,224. Carried forward to the appropriation account, this makes, with last year's surplus, £4,406; £1,800 is being contributed to rate relief, and the electrical engineer (Mr. C. M. Shaw) suggests that the balance shall be placed to a reserve account. He points out that there is an urgent need for building up an adequate reserve. There is every probability that the demand upon the department will grow, and that a third turbo-alternator, of not less than 3,000-kw. capacity, may have to be provided within the next year or so. It would be of great benefit to the department if at least half the cost of the new equipment could be met out of a reserve fund. The number of units generated by water power was 563,020, compared with 615,703 in the previous year, and this had affected the cost of production. The total works costs were 1·52 per unit sold compared with 1·04 per unit last year. There was a likelihood that higher salaries and wages would have to be paid, and a possibility of a large increase in the cost of fuel. To meet the ½d. increase in the cost of production, and to provide a reasonable surplus each year to build up a reserve fund of at least £15,000, he recommends increases in the charges. These suggestions include:—Lighting to be increased to a flat rate of 7½d. per unit (with certain exceptions), charges for power supplies to be increased to 75 per cent. over pre-war rates; a labour clause to be added to special contract agreements; heating supply, by separate meter, from 1d., plus 20 per cent., to 1½d. per unit. The Electricity Committee recommends the adoption of these increased charges.

TRAMWAY AND RAILWAY NOTES.

Ashton-under-Lyne.—Fares.—Hurst District Council applied to the Corporation Tramways Committee for a revision of the rates on the Hurst section, with a view to bringing the minimum stage from 1½d. to 1d., but the Committee replied that the introduction of the three-halfpenny fare was due to increased wages, &c., and any alteration would more probably be in the direction of an increase.

Australia.—Adelaide Tramway Trust.—The statement of accounts of the municipal tramway trust, Adelaide, for the half-year ended January 31st, 1920, shows that the total receipts for the period amounted to £242,894, contrasted with £218,550 for the corresponding term in 1919. The revenue per car-mile on the Adelaide service was 22·259d.; expenses per car-mile, 14·770d.; percentage of operating expenses to revenue, 66·080. On the Port Adelaide line the figures for the items enumerated were—18·305d., 13·408d., and 73·253d. The total expenditure incurred in operating the whole services amounted to £239,339, leaving a balance of £3,555.—*Commonwealth Engineer.*

Strike Settled.—The threatened strike of tramway employés at Melbourne was averted early last week, a compromise having been effected.

Bath.—Proposed Fare Increase.—The case of the Bath Electric Tramways, Ltd., showing the necessity for an immediate increase of fares was placed before a special City Council sub-committee by the general manager on May 20th. The company proposes an addition of ½d. to all ordinary fares, irrespective of distance, and an increase of 50 per cent. on workmen's tickets. Even with these additions, the company states that it will not have sufficient funds to carry out the track renewals required by the Council. The sub-committee viewed the proposals favourably and recommends their acceptance by the City Council. The consent of the Ministry of Transport has also been applied for.

Batley.—Breakdown of Plant.—In consequence of a breakdown of a portion of the main generating plant at the electricity works, there was no supply during the whole of May 26th and 27th on the Thorncliffe Road and Healey car routes. The other sections were temporarily able to be supplied with power by neighbouring authorities till the plant was repaired. The lighting and power services were not affected.

Blackpool.—Wage Increase.—By a further bonus advance on June 1st, the tramway employés have now an increase of 173 per cent. on pre-war rates, whilst on the Fleetwood section the increase is much larger. The minimum wage for a motorman is now £3 16s. 6d. for a week of 48 hours. The total war advances are costing the Corporation £40,000 a year, the last 9s. increasing the wage bill by over £8,000 a year.

Bolton.—Employes' Wages.—By a recent award the tramway workers are to receive an advance in wages of 3s. per week retrospective to March 29th last.

Bradford.—Traffic Delay.—About a hundred yards of the overhead wire on the Manningham section of the Corporation tramways became detached on the night of May 24th, and caused much congestion of traffic on the road for upwards of half an hour.

Continental.—Spain.—According to statements by the financial Press of Brussels, confirmed by that of Bilbao, a Spanish syndicate, formed by the Banco Vizcaino and the Hidroelectrica Ibérica, is in treaty in Belgium for the purchase of all the shares in the Bilbao tramway company. The capital of this company consists of 7·5 mill. fr. in shares of 100 fr. each, and of as many founders' shares, the value of which is not stated. The purchase price is said to be 40 mill. fr. The chief Belgian shareholders of the company are the Société Financière de Transport; the Société Generale d'Entreprises Electriques; the Société Generale Belges des Chemins de Fer, and the Banque de Bruxelles, the latter holding founders' shares only.—*Economic Review.*

Portugal.—The Lisbon tramcars ceased running on May 23rd, owing to the rejection by the Socialist members of the city council of an arrangement negotiated by a special committee permitting modifications of the conditions of the contract, including an increase in fares on account of the high price of coal and increased working expenses. There were no disturbances. The municipality has appointed a fresh committee, mainly Socialist, to deal with the question.—*The Times.*

Greenock.—Proposed Municipalisation.—The Corporation has appointed a Committee for the purpose of negotiating with the local Tramways Co. regarding the proposed purchase of the system by the town.

Huddersfield.—Year's Working.—The report on the tramway undertaking for the year ended March 31st, 1920, shows that the capital outlay up to date was £477,607. The income was £261,147; wages, £70,726; power, £35,733; total working expenditure, £217,526, leaving a gross surplus of £43,620. The net surplus, after deducting redemption of debt, depreciation, &c., was £485. Reserve accounts show a net total of £64,835.

Twenty-four cars are to be ordered, in addition to the six in course of erection.

Tramway Services.—It is stated that if the Halifax Corporation extends its tramway system to Elland, *via* Woodside, the Huddersfield Tramway Committee will seriously consider the question of pulling up the tramway lines between Elland and West Vale. This service has proved a most profitable one, and the Greetland people, whom it serves primarily, are showing concern at the prospect of being neglected. If the Halifax project comes into being, there will not be sufficient passengers to warrant a service to West Vale only.

Digitized by Google

Keighley. — Extensions. — The railless trolley-car system of the Corporation is about to be extended, it is stated, as far as Oxenhope (at the head of the Worth Valley). At present the service stops at Lees (Haworth). In 1916 the overhead equipment was erected as far as Oxhenhope, but the Local Government (Emergency Provisions) Act of that year barred further progress. Despite the difficulties with the present railless-trolley system on the other routes, by reason of the shortage of cars and the need for repairs, the Corporation is endeavouring to put the new service into operation at an early date.

London.—Floods.—A thunderstorm broke over south-west London on Wednesday evening last week, and the torrential rain caused considerable dislocation of traffic. At Ealing the tramway and District Railway services were interrupted owing to the flooding of the tracks. The Richmond railway service on the District line was suspended owing to the track being flooded to a depth of 12 in. at Chiswick Park, and a train on this line was derailed about 9 p.m. by damage to the track. At Kew Bridge the London and South-Western Railway was flooded to platform level, and the water entered the driver's compartment of an electric train.

An electrical defect at Holloway Road caused a suspension of traffic north of York Road on the Piccadilly Tube Railway on the same day.

Tramway and omnibus stopping places are being considered by the Ministry of Transport.

Fare Increase.—An arrangement has been come to between the London United Tramway Co. and the local authorities in Middlesex and Surrey that the company shall add 50 per cent. to its fares, as from June 1st, except in the case of workmen's fares, which are to remain unaltered. The company's lines run for more than 100 miles in the southern and western outer suburbs of London.

Whitsun Traffic.—During Whitsuntide the number of passengers carried on the trains, omnibuses and tramcars operated by the Underground Co. was as follows :—Saturday, 4,500.000 ; Sunday, 4,250,000 ; Monday, 5,250,000. The Whit Monday figure is considerably in excess of any previous record of passengers carried on any one day.—*The Times.*

Point failure on the City and South London Railway held up trains between Euston and the Angel for three-quarters of an hour early on Monday.

United States.—Railway Strike.—The employés of the Brooklyn Rapid Transport Co. struck for higher wages on May 28th, causing the closing down of the Brooklyn elevated railroads to the great inconvenience of the travelling public.

Rothwell.—Opposition to Extension.—The Urban District Council has affirmed its opposition to any extension of time being granted to the local tramway company for completing its schemes, powers for which have been obtained.

Swansea. — Strike Ended. — After five weeks of inactivity, the tramway services were resumed on May 30th, the employés returning to work, and unconditionally accepting the Joint Industrial Council's recent award.

Tramway Workers' Wages.—The meeting of the Joint Industrial Council of the Tramway Industry, held on May 28th, was concluded without a settlement being arrived at. The employers wished to introduce a scale of increases varying from 1s. to 3s., according to the district, but the employés' representatives held out for a uniform increase of 9s. (on the old rates) for all districts. The employés in Scotland have refused to submit their claims to arbitration.

TELEGRAPH AND TELEPHONE NOTES.

Cable Delays.—Canada.—Representatives of newspapers from all the provinces attended the annual meeting of the Canadian Press Association held at Toronto last month. *The Times* understands that proposals for the improvement of the cable services, which are entirely within the control of the Canadian Press, were approved. While expressing gratitude to the British Government for its offer of financial aid, the Association decided not to burden the British tax-payers, but it is prepared, from its own resources, and with such aid as the Canadian Government may grant, to improve the Imperial news services.

West Indies.—Cabling facilities from Trinidad are, according to the *Financial Times*, worse than ever. The repair ship of the West India and Panama Telegraph Co. has been for a considerable time laid up at Port of Spain for repairs, which are not expected to be completed for some months yet. Meanwhile the old cable is said to be breaking down in all directions, and the company is unable to obtain the services of a repair ship. Wireless telegraphy does not afford much relief as far as the West Indies are concerned. Messages from London reach Canada, but from thence it is quite uncertain how they are forwarded.

Finland. — Wireless Telegraphy. — A system of wireless telegraphy for Press messages will shortly be established between Helsingfors and Copenhagen. The Danish arrangements are complete, but the Finnish Military Authorities have not yet given their consent to the use of the Finnish wireless stations.—*Economic Review.*

France. — Telephone Subscribers' League.—The outcry against the telephone service has become so insistent that subscribers with grievances have formed themselves into a league, the object of which is to guard the interests of telephone users generally. The council of the league, says the *Daily Telegraph*, includes several hundred subscribers, and its duty will be to receive and examine all complaints of its members, and to suggest to the authorities improvements that might be effected.

Imperial Wireless Communication. — Committee's Report.—The Cabinet is now in possession, says *The Times*, of the report of the Imperial Wireless Telegraphy Committee appointed last November. The report, which has not yet been published, is unanimous.

Liverpool.—Wireless Demonstration.—The Applied Electricity Department of the University recently held a three days' demonstration of Marconi apparatus marvels, including a portable wireless telegraph and telephone set. The demonstration was of considerable interest to shipowners and those engaged in the electrical business. University students attended in large numbers.

London.—Storm Damage.—As a result of last week's thunderstorm, over 1,000 telephone subscribers were cut off—about 500 at Chiswick, 600 at Waltham Cross, and 60 at Hammersmith. The defect, which was soon put right, is said to have been due to the sudden rise of water in manholes where work was in progress, the water reaching the cables before they could be sealed.

Wireless Telephony.—For the first time in the history of British journalism, spoken news messages for publication were received by wireless telephony from Chelmsford, Essex, direct by means of the receiving apparatus recently installed at the *Daily Mail* offices, London. The news was transmitted from the Marconi station, and related to local affairs and to the demonstration before members of the London Chamber of Commerce and the Chartered Institute of Secretaries, which took place on May 26th, and listeners-in at different parts of the country, at distances varying from 100 to 450 miles, reported that the messages were heard distinctly.

Pacific Cable.—Proposed Duplication.—Mr. Milward, manager of the Pacific Cable Co, announces that a project is under consideration to duplicate the Vancouver to Norfolk Island cable. The cable cannot be completed until 1921. It will cost nearly £4,000,000. The Pacific "All-Red" cable, which was completed in October, 1902, was the outcome of the desire for an all-British telegraphic route between Great Britain and the Dominions. The distance from Vancouver to Norfolk Island, whence the cable proceeds to New Zealand and Australia, is 6,000 miles. There are two intermediate stations between Vancouver and Norfolk—namely, Fanning Island and Fiji. The cable between Vancouver and Fanning is the longest hitherto laid in one piece.—*The Times.*

Private Wireless Installations.—Fire Risk.—The range and capacity of many privately owned and operated wireless stations have been greatly increased, and many of these stations are located in private dwellings which are equipped with combination gas and electric lighting fixtures, the electric lighting equipment being connected to a 110-volt A.C. system which is grounded. Details are given in the *Electrical Review*, of Chicago, of a case in which trouble was experienced owing to fuses blowing and static discharges and even arcing in the fixtures, &c., when the wireless equipment was in use. Investigation showed that with the sending set in operation, the wiring of the house was subjected to an induced pressure of about 5,000 volts in addition to the line voltage. Further tests must be made before definite conclusions can be drawn, but it is suggested that :—(1) Insulating joints be not permitted on electric lighting fixtures in building containing wireless stations ; (2) the wiring of such fixtures should be with conductors having a rubber insulation at least $\frac{3}{64}$ in. in thickness ; (3) some provision be made for the draining of induced current from the ungrounded wire of the lighting system before the induced pressure reaches dangerous values ; (4) it may be necessary to insist upon wireless stations which take energy from a public service being connected to an independent transformer. It has still to be investigated to what extent parallelism between the antenna and the wiring affects the results.

CONTRACTS OPEN AND CLOSED.

(The date given in parentheses at the end of the paragraph indicates the issue of the* Electrical Review *in which the "Official Notice" appeared.)

OPEN.

Australia.—Sydney.—August 4th. N.S.W. Government Railways and Tramways. Two 1,000-kw. sub-station units. Chief Electrical Engineer, 61, Hunter Street, Sydney.

August 3rd. Department of Public Works. Turbines and generators for the Barren Jack hydro-electric development scheme. Department of Public Works, Sydney.

July 18th. City Council. Maximum demand indicators. Electric Lighting Department, Town Hall, Sydney.

Perth. — July 14th. P.M.G.'s Department. Telegraph and telephone instruments (various parts). Schedule 674.

June 16th. P.M.G.'s Department. Telegraph and telephone instruments (various parts). Schedule 680. (May 14th.)

Digitized by Google

ADELAIDE.—June 23rd. P.M.G.'s Department. Telephone parts (schedule 541). (May 21st.)

Barnes.—June 7th. Urban District Council Electricity Department. Coal-handling plant and overhead steel or ferro-concrete bunkers. (May 14th.)

Bedford. — June 21st. Electricity Department. One 2-ton locomotive jib crane, with grab and track rails, steam and other pipework. (See this issue.)

Belgium.—June 8th. Tenders are being invited by the municipal authorities of Horlon-Hozemont (Province of Liége) for the concession for the supply of electricity for lighting and power purposes.

The Belgian State Railway authorities at La Salle Madeleine, Brussels, are shortly inviting tenders for the supply of a quantity of material, in connection with the Stone train electric lighting system, including 636 dynamo suspensions, 1,075 battery cases and 636 driving pulleys, with safety guards.

June 19th. The Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels, are inviting tenders for the supply of 1,710 kilometres of covered copper wire, comprising several varieties.

Carlisle.—June 25th. Electricity Department. One 3,000-KW. turbo-alternator and condensing plant. (May 28th.)

Crewe.—June 5th. Electricity Department. 12 months' supply of slack (about 4,000 tons). Borough Electrical Engineer.

Dublin. — June 7th. Electricity Supply Committee. 12 months' supply of single-phase and three-phase meters. (May 21st.)

June 10th. Electricity Supply Committee. Feed pump, tanks, pipework, &c., for Pigeon House generating station. (May 28th.)

Dundalk.—June 15th. Urban District Council. Electricity Department. 750 yd., L.T., 3-core, paper-insulated, lead-covered and armoured cable; disconnecting boxes (pavement type) and joint boxes. (May 28th.)

Edinburgh.—June 19th. Electricity Supply Department. E.H.T. and L.T. switchgear, &c., for Portobello station. (May 21st.)

France.—The French Post & Telegraph authorities in Paris have just invited tenders for the supply of 170 tons of bronze and copper wire, to be made from old wire supplied by the department.

Grimsby.—June 7th. Electricity Department. E.H.T. cables and pilot cables (specification No. 146). (May 28th.)

Ince-in-Makerfield.—June 15th. Urban District Council. Waterworks Department. Motor-driven pumping sets; cables; alterations to winding engine from steam to electric drive; switchgear. (May 28th.)

Leeds.—June 14th. Electricity Department. 12,000-KW. steam turbine, alternator and condensing plant. (May 14th.)

London.—HACKNEY.—June 9th. Electricity Department. Four water-tube boilers, each 33,000 lb. per hour capacity, with superheaters, mechanical stokers, &c.; four induced-draught plants; four fuel economisers; one 10,000-KW. turbo-alternator and exciter, with ventilating fan and air filter or cooler; one surface condensing plant; two circulating water motor-driven pumps; E.H.T. switchgear; two 20,000-KW. coupler panels; one 10,000-KW. generator panel; six 2,000-KW. and one 4,000-KW. feeder panels. (May 7th.)

BETHNAL GREEN.—June 7th. Electricity Supply Department. Two 500-K.V.A. transformers; one E.H.T. and one L.T. panel; L.T. feeder cables; section pillars and road work. (May 21st.)

WIMBLEDON.—June 12th. Electric Lighting Committee. Two boilers, with mechanical stokers, induced-draught fan and motor, pipework, steel chimney, &c. (May 28th.)

Manchester.—June 7th. Electricity Department. Main and auxiliary switchgear; Section A, 33,000-volt and 6,000-volt main switchgear; Section B, pressure-testing switchgear; Section C, 420-volt A.C. auxiliary switchgear; Section D, 240-volt D.C. auxiliary switchgear. (April 30th.)

New Zealand.—AUCKLAND.—September 1st. Harbour Board. For the supply of electric capstans and spares. Messrs. W. & A. McArthur, Ltd., 18-19, Silk Street, Cripplegate, London, E.C. 2.

Newport.—June 26th. Electricity Department. Turbo-alternating plant, surface-condensing plant, boilers, economisers, draught plant, steel flue and stack, &c. (See this issue.)

Nuneaton. — June 30th. Electricity Department. 1,000-KW., D.C., geared turbo alternator, surface-condensing plant and pipework. (See this issue.)

Rochdale.—June 5th. Corporation. Electric lighting installation in 52 houses on Spotland site. Particulars from Architects' Office, Town Hall.

Salford.—June 5th. Electricity Department. 12 months' supply of D.C. and A.C. meters. (May 21st.)

Seychelles Islands.—An electric light system is being introduced in the Seychelles, and tenders for the lighting-up of Port Victoria, in Mahé, are invited in the latest issue of the *Government Gazette* to reach this country.—*Times Trade Supplement.*

Southampton. — July 3rd. Electricity Department. E.H.T. and H.T. switchgear and D.C. control panel. (See this issue.)

Spain.—The Spanish Government has just invited tenders for the supply of the material necessary for the equipment of 12 wireless telegraph and telephone stations in the Madrid military area.

Warrington.—June 15th. Electricity and Tramways Committee. Motors and transformers. (May 28th.)

CLOSED.

Belgium. — Four Belgian and one British concern (B.I. & Helsby Cables, Ltd.) submitted tenders recently to the municipal authorities of Antwerp, for the supply of the 10,690 metres of armoured electric mains required for the electrical equipment of the Nos. 2 and 3 docks at the port. The result of the tendering has not yet been made known.

Chesterfield.—Electricity Committee. Accepted:—
Feeder cables and the extension of cables, £8,775.—B. I. & Helsby Cables, Ltd.

Glasgow.—Town Council. Accepted:—
Gear wheels.—A. Wiseman, Ltd.
V.I.R. cable.—Liverpool Electric Cable Co., Ltd.; Western Electric Co., Ltd.
Car wheels.—J. Baker & Co.
Rotary converter and switchgear.—Met.-Vickers Electrical Co., Ltd.

The Health Committee has accepted the offer of Messrs. W. C. Martin & Co., for the installation of electric lighting, &c., at the Knightswood Hospital, the tender being £7,579.

Town Council. Accepted. Supplies for 12 months:—
Copper bonds.—B. I. & Helsby Cables, Ltd.
Armature coils.—Manchester Armature Repair Co., Ltd.
7/20 V.I.R. cable.—Liverpool Electric Cable Co., Ltd.
Trolley wire.—F. Smith & Co., Ltd.

Halifax—Tramways and Electricity Committee. Accepted:
Babcock & Wilcox, Ltd.—One patent cross-type marine boiler for the electricity works, £10,710.
E. Green & Son, Ltd.—One economiser of 240 tubes, £2,063.
Crompton & Co.—Three new motors, £777; starting gear for same, £170.

Manchester.—Tramways Committee. Accepted:—
Trolley wire.—F. Smith & Co. (incorporated in the London Electric Wire Co. & Smiths, Ltd.)
Fishplates for tramway rails.—United States Steel Products Co.

Electricity Committee. Accepted:—
Laying cable.—Callender's Cable & Construction Co., Ltd.
Knife switches.—Ferguson, Pailin & Co., Ltd.; Park Royal Engineering Works, Ltd.; Whipp & Bourne, Ltd.
Extension to balancer board, Dickinson Street Station.—Whipp and Bourne, Ltd.
One 8,000/10,000-KW. turbo-alternator and condensing plant for Stuart Street Station.—Richardsons, Westgarth & Co., Ltd. Contract and licence to sublet the alternator to C. A. Parsons & Co., Ltd., to be prepared and sealed.
Steel work on workshop, Barton Station.—F. Morton & Co., Ltd.

Salford.—Tramways Committee. Accepted:—
Metal-filament lamps during the year, 1s. 8d. each (approx. £750).—British Union Lamp Works, Ltd.

Electricity Committee. Accepted:—
Additions to buildings and construction of foundations for the 5,000-KW. turbo-alternator set, £3,220.—Smith & Briggs, Ltd.
Switchgear for the sub-station of the C.W.S. at Weastle, £1,234. Switchgear for controlling the supply to second feeder cable to Eccles, £264; one E.H.T. switch-cubicle, £874; two 600-K.V.A. transformers, in connection with the supply of electricity to the sewage works, £2,048.—Met.-Vickers Electrical Co., Ltd.

FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Saturday, June 5th. At Albemarle Street, W. At 3 p.m. Tyndall lecture on "The Theory of Quanta," by Dr. J. H. Jeans, F.R.S.

North of England Institute of Mining and Mechanical Engineers.—Saturday, June 5th. At the Wood Memorial Hall, Newcastle-on-Tyne. At 2.15 p.m. General meeting.

Royal Society.—Monday, June 7th. At John Street, Adelphi. At 7 p.m. Cantor lecture (postponed from April 26th) on "Aluminium and its Alloys," by Dr. W. Rosenhain.

Electrical Trades Benevolent Institution.—Monday, June 7th. At 36/38, Kingsway, W.C. At 2.30 p.m. General meeting.

British Science Guild.—Tuesday, June 8th. At Goldsmiths' Hall, Foster Lane, E.C. At 3 p.m. Annual meeting.

Institution of Electrical Engineers (Scottish Centre).—June 9th to 12th. Summer outing. June 11th. Visit to Kinlochleven.

(Wireless Sectional Meeting). — Wednesday, June 9th. At the Institution of Mechanical Engineers, Storey's Gate, S.W. At 6 p.m. Paper on "High-frequency Machines," by Mr. M. Latour.

Institution of Mining Engineers.—Thursday, June 10th. At 11 a.m. At Burlington House, Piccadilly. Annual meeting. At 7 p.m. At the Connaught Rooms, Gt. Queen Street, W.C. Annual dinner.

Friday, June 11th. At 10 a.m. Visit to the Royal School of Mines and the Science Museum, South Kensington, S.W.

Institute of Metals.—Thursday, June 10th. At the Institution of Mechanical Engineers, Storey's Gate, S.W. 1. At 8 p.m. Annual May lecture on "The Recent Progress in Thermo-Electricity," by Prof. C. A. F. Benedicks.

Digitized by Google

NOTES.

National Joint Board of Employers and Staff Members for the Electricity Supply Industry.—Following on the announcement regarding power-station engineers in our last issue, we are now able to give the recommendations as to commercial and clerical staffs, which have been settled by the National Joint Board. The following schedule of salaries is applicable to all electricity supply undertakings, statutory or non-statutory, for public or private supply in Great Britain and Ireland :—

Basic rates of wages or Salary per annum.	Amount to be paid as from April 1st, 1920.
£75 and under.	An additional £135 per annum to the basic rates.
100	£240 per annum.
150	300
200	360
250	420
300	480
350	540
400	600
450	660
500	720
550	780
600	840
650	900
700	960
750	1,020

The basic rates are based upon the net amounts paid on April 1st, 1919, after deduction of all awards, grants, and bonuses paid in respect of increased cost of living, and include all merit, scale, or grade increases granted up to that date. Any increases granted since that date are to be deemed to be increases in the basic rates as from the same dates that such increases were paid.

Where total salaries and bonus paid since April 1st, 1919, amount to more than the amounts shown in the table, no reduction is to be made. The increases shown are to apply to all male employés over 21 years of age only, except temporary ones. The rates to the extent of 75 per cent. are to apply generally to women employés over the age of 21 years who were in receipt of the basic rates set out in the table, but exceptional cases may be considered on their merits. The remuneration of juniors is not fixed.

The increases are to apply until January 1st, 1901, by which date it is anticipated a graded schedule will be agreed, or until a revised scale is adopted on account of a material variation in the cost of living.

British Oil.—It was officially stated on May 27th that so far as the research work in Derbyshire is concerned, which has received Government support, it will take another six months to establish whether oil can be obtained in sufficient quantities to make oilfields in Britain a commercial possibility.

Fatalities.—The *Daily Telegraph* reports that on Sunday night, while, at the entrance to the Forth Goods Station, Newcastle-on-Tyne, a gang of a dozen linesmen employed by the Newcastle and District Electric Lighting Co. was repairing a faulty main in Neville Street, the current was switched on unexpectedly. Two of the men, Thomas Farrar and Murray Kennedy, were immediately killed, while another, Thomas Lawrence, was injured.

At an inquiry held into the death of a foreman electrician named Henry Spurr, aged 37, who was killed while making alterations to the electrical installation at the Cerebos Salt Works, Greatham, near West Hartlepool, Mr. S. R. Bennett, H.M. Factory Inspector, mentioned that this case was the third in a fortnight in which death had been caused by the 220-volt current in the Tees-side district. The evidence showed that while Spurr was behind the switchboard at the works on Saturday, May 22nd, there was a flash, and he was found unconscious. Artificial respiration was used for 40 minutes without effect. Mr. Neve, works manager, said that immediately after an accident a year ago, when a boy touched a live wire and was killed, they had instructions to do certain work to bring the installation up to Home Office standard, and Spurr and others had been engaged on the work pretty continuously for six months. Mr. Edgar Phillips, the contractor, thought that Spurr had been using a screwdriver, and that his hand had slipped and caught a bare conductor. The jury returned a verdict of "Accidental death," no blame being attached to anyone. Mr. Bennett mentioned that in the view of the Home Office, artificial respiration in those cases should be kept up for two hours, and a notice to this effect was being issued.

Inquiries.—A correspondent desires information regarding the details of the treatment of wood separators with soda ash, for accumulators. Makers of small insulators, known as "fish-backbone" insulators, and French makers of Steatite for insulation, are asked for. Suppliers of "Micarta," "Bakelite," or substitutes, and Swedish iron rod and sheet are wanted.

The Association of Consulting Engineers (Inc.).—The annual dinner of the Association was held at the Connaught Rooms, London, on May 28th. Mr. H. J. Rofe, chairman of the committee of the Association, presided, and a thoroughly enjoyable evening was spent; some 70 members and guests were present and partook of an excellent menu, after which the usual toasts were honoured.

Following the toast of "The King," Mr. W. B. CLODE, K.C., proposed the "Association of Consulting Engineers," and referred to the engineer as a romantic person who harnessed the powers of nature in the service of mankind. The CHAIRMAN, who responded, also proposed "Engineering Institutions," mentioning the good work done by the Institutions of Civil, Electrical, and Mechanical Engineers. He then outlined some of the aims and objects of their own Association. Capt. H. RIALL SANKEY, C.B., C.B.E., president I.Mech.E., and member of Council, Inst.C.E., replied, and pointed out that besides the Institutions mentioned by the chairman there were a number of others which fulfilled important functions in their respective spheres. He also referred to the desirability from all points of view of the registration of qualified engineers.

Mr. ROGER T. SMITH, President I.E.E., who also replied, said that the Institution of Electrical Engineers had long ago ceased to represent solely the professional section of the industry; its aim now was to represent the electrical industry as a whole, which accounted for its policy of decentralisation. The various territorial centres scattered over the country were doing very valuable work. The desirability of registering all qualified engineers was admitted, but he was told that it took the medical profession 20 years to carry its registration through. The present difficulty was to settle upon an adequate definition of a civil or any other engineer.

The "Future of British Industries" was proposed by Mr. G. MIDGLEY TAYLOR, who gave it as his opinion that the future prosperity of industries in this country depended on cheap power, and in this connection he hoped that the schemes proposed by Sir John Snell, who was present, and his Commission would be brought to early fruition. Further, the water powers of this country should not be neglected; although they were not so abundant as those to be found in other countries, still they were of sufficient importance to render useful aid. He had no fear for the future of British industries. One thing did trouble him, however, and that was labour. He did wish that they could by some means or other rouse the working man's sense of responsibility, to make him endeavour to do an honest day's work.

The toast was responded to by Viscount COWDRAY, P.C., President of the Federation of Civil Engineering Contractors, who dealt with the financial side of the matter, and said in part that the present state of affairs with regard to labour was due to the lack of decisive action on the part of the Government in dealing with wages and claims put forward. Labour could not be dealt with in sections, it could only be considered as a whole. When they sought information or advice on technical engineering questions they need go no further than this country, but when it came to business matters they had to go, he was sorry to say, to the U.S.A. It was very wasteful to burn oil under boilers; it should be reserved for internal-combustion engines. The oil existing within the British Empire, in his opinion, should be kept for use within the Empire.

Mr. LL. B. ATKINSON, secretary of the Cable Makers' Association, and president-elect I.E.E., did not think the prospect before them was so rosy as was thought by some; it was time they paused to consider to what they were heading. He need not emphasise the dangers that attended constantly increasing wages and their attendant evils. They were suffering from lack of production, the reason for which was the fear of unemployment on the part of the workers. That was the first problem they must solve, and in his opinion the only way of doing so was by each particular industry guaranteeing the employment of a full complement of operatives in lean as well as in prosperous times. To do that co-operation was essential between factories so that work could be distributed evenly over the whole, and also co-operation in selling the finished products abroad. The next problem they had to solve was that of standardisation, and what they were in need of was co-operative effort. He asked consulting engineers to give their assistance in solving those problems; there was just as much skill required to select the necessary plant for a particular job from standardised as from unstandardised material, and they would need their help to break the economic front, which must be broken if the future of British industries was to be assured.

Mr. SIDNEY R. LOWCOCK proposed "Our Guests." Sir F. J. WILLIS, assistant secretary, Ministry of Health, and Mr. ARTHUR J. LEES, secretary, Urban District Councils' Association, responded, and the final toast of the evening, that of "Our Hon. Officers," was proposed by Mr. H. W. COUZENS, and responded to by Messrs. A. H. DYKES, hon. secretary, and F. E. WRIGHT, hon. solicitor to the Association.

Service Notes.—On return from Constantinople, Mr. T. S. Harvey, acting assistant electrical engineer, has been posted to Devonport Dockyard. Lieut. H. C. Crossley, Cinque Ports Fortress Engineers (Electric Lights Company), has resigned his commission after four years' service, and has been granted the rank of captain. Lieut. H. F. Hecking, Lancashire Fortress Engineers (Electric Lights Company), has resigned his commission. He served in the corps from 1916. Lieut. G. V. Waterhouse has resigned his commission in the Electric Lights Company of the Fortress Engineers (Territorial Force). A large number of wireless operators, some 150, are wanted for the army, as well as a lot of electricians (wireless) fitters, and instrument makers for the Army Signal Service. The service is competing against private firms by offering a bounty of £100 to wireless operators and £50 to the others.

Digitized by Google

Kinema Operators' Strike.—A number of kinema operators are on strike in Manchester and Salford for a wage of from £3 10s. to £4 10s. a week according to the size of the hall, locality, and charge for admission. The Electrical Trades Union has declared the strike, and the men's officials state that over 80 per cent. of the proprietors have met the demands in full. To these permits to perform have been granted. The remaining kinemas are being picketed.

The Women's Engineering Society.—At the first annual general meeting of the Society, which was incorporated this year, the Hon. Lady Parsons presided, and said, in the course of an address, that in order to gain their objects they must exercise patience and continue their struggle. Miss Rachel M. Parsons was elected president, Miss Selby hon. secretary, and Lady Parsons treasurer, with a strong Council. The annual report stated that the work of the Society was meeting with success. A small quarterly, entitled "The Woman Engineer," had been established, and a club-room opened at 46, Dover Street, W. A resolution deprecating the continued exclusion of women from training and employment in many industries, and calling upon all leaders of industry and Trade Unions to unite with them in overcoming all artificial barriers to progress, was carried, and a discussion took place on "The Present Position of Women in the Various Branches of Engineering."

Appointments Vacant.—Mains engineer (£6), for the Greenock Corporation Electricity Department; switchboard attendant (92s. 3d.), for Rawtenstall Corporation Electricity Works; lecturer in mathematics (£315), assistant lecturers in mechanical or electrical engineering (£275 or £315), for the Woolwich Polytechnic; mains assistant, for the Colombo Electric Tramways and Lighting Co., Ltd.; second assistant superintendent, for Central Canal Works, Amritsar, Punjab (Rs. 725 to 1,025 per month); charge engineer (£270), for the Bootle Corporation Electricity Works; meter superintendent (£5 5s.), for the Paisley Corporation Electricity Department; E.H.T. plumber-jointer (£5), for the Swansea B.C. Electricity Department; junior for the mains department (84s.), for the Bradford Corporation Electricity and Tramways Department; engineering draughtsman (£200 + 20% + £120), for the Hammersmith B.C. Electricity Department. See our advertisement pages to-day.

INSTITUTION NOTES.

Institution of Electrical Engineers.—The Secretary of the Institution announces that applications for the following scholarships may be sent to the Secretary, R.E. War Benefits Committee, R.E. Institute, Chatham:—"A" Scholarships of £40 per annum for children of officers and other ranks of the Royal Engineers of all branches who, prior to the war, were in a position to give their children a public school education. Ten of these scholarships, tenable between the ages of 10 and 18, are available. "B" Scholarships of £15 per annum for children of warrant officers, N.C.O.'s and men, to assist in educating them at a technical or secondary school. Tenable between the ages of 13 and 16 years—40 available. "C" Kitchener Scholarships, at present limited to one of £40 and two of £15, under the same conditions as "A" and "B" respectively. Owing to the large number of casualties, these scholarships will be confined, for the present, to children or dependents of members of the Corps killed in action, &c., or permanently disabled, and in all cases primary consideration will be given to cases of necessity. The applications to be considered in the first adjudication were to be sent in by June 1st, and the necessary forms are obtainable from the Secretary of the R.E. War Benefits Committee.

WIRELESS SECTIONAL MEETING.—On Wednesday, June 23rd, at 6 p.m., at the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W., a paper will be read by Mr. B. S. Gossling on "The Development of Thermionic Valves for Naval Uses."

Liverpool Wireless Association.—The usual semi-monthly meeting was held at 56, Whitechapel, Liverpool, on May 26th, when the subject under review was the "Winding of Inductances" and 'Loose Couplers." Numerous methods of construction were discussed, and varying experiences under numerous conditions related. A member also exhibited a piece of apparatus for winding honeycomb coils.

Incorporated Municipal Electrical Association.—Engineers or others who are specially interested in the subjects of papers to be read at the forthcoming I.M.E.A. Bradford Convention, and who wish to be present to speak thereon, should communicate with the Secretary, I.M.E.A., Electricity Works, Factory Lane, Croydon.

Association of Consulting Engineers.—The annual general meeting was held on May 28th, Mr. H. J. Rofe presiding. Moving the adoption of the report of the committee for the past year, the chairman said a sub-committee had been engaged in drawing up a model general set of conditions for use in work carried out on a prime cost and profit basis, a method of carrying out work which had become more and more general. Another matter that had called for attention was the formation of the Federation of Civil Engineering Contractors by the leading firms in the country; they were asking for an over-riding clause to be inserted in all engineering contracts, which in its present form the Association could not accept. As far back as 1914, the Committee had had under consideration a model set of general conditions of contract for electrical work, drawn up by the Institution of Electrical Engineers, to several clauses of which the Committee took exception. The matter had been in abeyance since the beginning of 1915, but the whole question had now been re-opened. The Institution was revising the model general conditions, and had invited the Association to send a representative to sit on a committee formed of all the various interests connected with electrical work. The manufacturers had agreed to modify practically every clause to which the Association raised objections, and he thought that eventually the Electrical Conditions of Contract would come into line with the general conditions that were inserted in their civil engineering contracts. The Council of the Institution of Civil Engineers suggested that the rise in the cost of work automatically increased the engineer's remuneration to the extent necessary to meet his increased expenses, but that in certain cases he was justified in charging an extra fee; in respect of reports, inquiries, Parliamentary work, and general advice on engineering matters, the Council was of opinion that civil engineers were justified in making an advance of 50 per cent. on pre-war rates. These views supported the action recently taken by the Committee of the Association.

During the year the British Engineering Standards Association had asked the Association to appoint representatives on various Sub-Committees.

The Foreign Office and the Board of Trade had recently written to the Association suggesting that members who were going abroad should give notice to the Department of Overseas Trade of their intention, so that the Department could notify H.M. Diplomatic Consular and other officers concerned, and give them the opportunity of rendering assistance and of discussing matters connected with British trade of very great interest to them. This, he thought, was a very valuable suggestion. The report was carried unanimously.

The accounts for the year showed a balance of income over expenditure of £24.

The ballot for new members of the Committee resulted as follows:—

London Members.—Messrs. Kenneth P. Hawkaley, W. Vaux Graham, A. M. Sillar, H. R. J. Burstall, and John H. Rider.

Country Members.—Messrs. James Caldwell and F. W. Hodson.

Votes of thanks were accorded to the honorary solicitor, Mr. F. E. Wright; to Messrs. Cash, Stone & Co., the honorary auditors; to Mr. H. J. Rofe for acting as chairman; and to the honorary secretary (Mr. A. H. Dykes) and the honorary treasurer (Mr. S. R. Lowcock) for their valuable services during the past year.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW *posted as to their movements.*

MR. STEVENSON, telegraph and electrical engineer to the Caledonian Railway Co., Glasgow, on the occasion of his retirement on reaching the age limit, was waited upon on Friday by his office staff and a few friends and presented with a gold watch for himself, and a diamond ring for Mrs. Stevenson. The presentation was made by Mr. A. S. Humpton, his successor in office.

The King has granted permission for MR. C. D. LEYS, electrical engineer, Malta Dockyard, to wear the Japanese Order of the Rising Sun (Fourth Class), conferred upon him in recognition of valuable services.

MR. E. H. W. COOKE, who was chief accountant with the Birmingham Corporation Gas Department for many years, and has been appointed chief accountant with the Metropolitan-Vickers Electrical Co., Manchester, bade farewell to the Gas Committee on Monday.

Leek (Staffordshire) Urban District Council has decided to increase the salary of the electrical engineer to £400 per annum.

Horsham Urban District Council has increased the salary of the assistant engineer at the electric lighting works from £220 to £250 a year.

MR. F. HARMAN LEWIS, chief electrical engineer to the Leyton Urban District Council, on completing 21 years' service, has been presented by the staff and employés with a clock with Westminster tubular chimes.

MR. A. W. J. BEDBROOK has resigned his position as managing director of the C.E.A., Ltd. His address is 140, Delaware Mansions, Maida Vale, W.

Messrs. Robinson & Hands Electrical Co., Ltd., of Birmingham, have just engaged MR. S. GRAY, late of Messrs. J. H. Tucker & Co., Ltd., to take complete charge of their case-making department for the manufacture of fuseboard cases and general electrical woodwork.

The honour of O.B.E. has been conferred upon CAPTAIN JOHN WILSON, chief electrical engineer, Buenos Aires Western Railway, superintending engineer of the Shandon Experimental Station. CAPTAIN THEODORE WILLIAM SMYTHE, Master of the Eastern Telegraph Co.'s cable ship *Electra*, has received a similar distinction. MR. P. F. JOHNSON, late Chief Officer of Messrs. Siemens's cable ship *Faraday*, is made M.B.E.

Obituary.—MR. J. FINDLAY.—The death is announced of Mr. James Findlay, for many years managing director of the Rugby Lamp Co., Ltd., whose premises were taken over by the B.T.H. Co., Ltd.

MAJOR S. C. A. WACE.—The death is announced to have taken place at Hampstead of Major S. C. A. Wace, C.B.E., Royal Marine Artillery, head of the Wireless Telegraphy Board. He was in charge of the wireless station at Malat during the war, and was the author of a hand-book on "Wireless Telegraphy."

NEW COMPANIES REGISTERED.

Anglo-Russian Engineering Co. (Birmingham), Ltd. (167,458).—Private company. Registered May 14th. Capital, £1,000 in 5s. shares. To carry on the business of electricians, mechanical engineers, suppliers of electricity, manufacturers of and dealers in electrical apparatus, &c. The subscribers (each with one share) are: J. B. Webb, 1, Telford Avenue, Streatham, S.W. (managing director, Anglo-Russian Engineering Co., Ltd.); J. Hastings, Lee Mount, Yardley Wood Road, Moseley, Birmingham, accountant; V. E. Whalley, Alyon, Dora Road, Small Heath, Birmingham, engineer. The subscribers are to appoint the first directors. Secretary: J. Hastings. Registered office: 26, Guildhall Buildings, Stephenson Street, Birmingham.

Wilkins Wire and Wire Ropes, Ltd. (167,584).—Private company. Registered May 18th. Capital, £125,000 in £1 shares. To take over the undertaking, assets and liabilities of the Wilkins Wire Rope Co., Ltd. (incorporated in 1904), and to carry on the business of wire and wire rope manufacturers, manufacturers of and dealers in mining, colliery and electrical machinery, electrical, mechanical, hydraulic, heating and ventilating engineers, &c. The subscribers (each with one share) are: Elsie L. Trollope, 28, Crossways, Stoke Newington, N.16; A. J. Taylor, 28, Duncombe Road, Hornsey Rise, N.19, clerk. The first directors are: S. H. Hudson (chairman and permanent director), T. H. Hudson, General W. Wright Bemrose and A. S. Watson. Secretary: W. E. Bowley. Solicitor: H. Clifton, 4, New Court, Lincoln's Inn, W.C.

Catchpole & Maurice, Ltd. (167,513).—Private company. Registered May 17th. Capital, £5,000 in £1 shares. To take over the business of wholesale and export electrical and mechanical engineers and merchants formerly carried on by A. E. Catchpole and E. Maurice at Albion House, New Oxford Street, W.C. The first directors are: A. E. Catchpole, 17, Broxholm Road, S.E.27; C. B. Maurice, Russell Square Mansions, W.C.; F. W. Dennis, 15, Ventnor Villas, Hove; W. N. Scovell, 41, Lee Park, Blackheath. Solicitor: A. G. Hardy, 27, Chancery Lane, W.C. Registered office: Albion House, 59-61, New Oxford Street, W.

McReynolds Trolley Wheel Co., Ltd. (167,495).—Private company. Registered May 15th. Capital, £5,000 in 5s. shares. To carry on the business indicated by the title, and that of electric, railway, tramway, naval, marine and general engineers, &c. The subscribers (each with one share) are: E. M. Lloyd, 143, Mount View Road, Stroud Green, N.4, secretary; A. E. Hutton, 55, Kimberley Road, Stockwell, S.W.9, secretary. The subscribers are to appoint the first directors. Solicitors: Roney & Co., 42, New Broad Street, E.C. Registered office: 11, Angel Court, E.C.

Dux Electric Quilt & Fibril, Ltd. (167,727).—Private company. Registered May 28th. Capital, £10,000 in £1 shares. To take over the business of mattress manufacturers, engineers and agents carried on by W. Fairclough, H. Speakman, T. R. Greenough and R. E. Beddoe as "Hall and Co." and "Fibril and Co.," together with certain British and Colonial patents for improvements in the manufacture of horsehair, devices for fastening or securing ropes, rope handles, cords and the like, and improvements in electric heating quilts, blankets and the like. The first directors are: H. Speakman, The Walmsleys, Leigh Road, Leigh, Lancs.; T. R. Greenough, Beachwood, Leigh Road, Leigh, Lancs.; E. C. Beddoe, Tower Buildings, Wallgate, Wigan; E. R. Davies, 3, King Street, Wigan; G. A. Kirk, Electrical Works, Wilcock Street, Wigan; P. Gaskell, jun., 112, Park Road, Hindley. Registered office: Dobb's Fold, Wallgate, Wigan.

Telephone Manufacturing Co. (1920), Ltd. (167,634).—Registered May 20th. Capital, £600,000 in £1 shares. To take over the business of the Telephone Manufacturing Co., Ltd., and to carry on so far as is lawful the business of makers, sellers, hirers out, maintainers and workers of and dealers in telephones and telegraphs, &c. The first directors are: F. T. Jackson, 20, Herne Hill, S.E.; C. Cochran, 58, Newark Drive, Pollokshields, Glasgow; J. MacMahon, Sheriff Park House, Rutherglen, N.B. (all directors of London Telephone (N.S.) Co., Ltd., and other companies); T. H. Walker, 7, Linden Gardens, W.; C. E. Walker, 43, Clifton Hill, Maida Vale, W.; C. Clare, 32, Eaton Terrace, S.W. (managing director, George Clare & Co., Ltd., &c.). Minimum cash subscription, 7 shares. Solicitors: Durrant, Cooper and Hambling, 70-71, Gracechurch Street, E.C. Registered office: Hollingsworth Works, Martell Road, West Dulwich, S.E.

H. & F. Moore, Ltd. (167,649).—Private company. Registered May 21st. Capital, £2,000 in £1 shares. To carry on the business of machine builders, electricians, electrical, mechanical, motor, telephone and general engineers, &c., and to adopt an agreement with H. Moore. The subscribers (each with one share) are: Mrs. C. Stanton, Albert Road, Hinckley; B. Gill, 49, Winchester Avenue, Leicester. Mrs. C. Stanton is first director. Secretary: F. E. Fordham, 19, Cank Street, Leicester. Registered office: Albert Mill, Hinckley, Leicestershire.

National Electric Welding Co., Ltd. (167,631).—Private company. Registered May 20th. Capital, £10,000 in £1 shares (4,000 preference). To carry on the business indicated by the title. The first directors are: F. E. Saunders, 63, Leigham Court Road, Streatham, S.W.; P. Buckley, New Oxford and Cambridge Club, 68, Pall Mall, S.W.; N. D. R. Bruce, Blythswood, 63, Leigham Court Road, Streatham, S.W.; H. C. Wright, Wychwood, Arlington Drive, Mapperley Park, Nottingham. Solicitor: W. H. Bellamy, Walter House, 418-422, Strand, W.C. Registered office: 6, Old Queen Street, Westminster.

Taggart & Wilson, Ltd. (11,252).—Private company. Registered in Edinburgh May 20th. Capital, £6,000 in £1 shares. To carry on the business of general merchants, electricians, mechanical, electrical, gas, structural, water and general engineers, ironmongers, builders, &c. The subscribers (each with one share) are: R. Taggart, Arcadia, Cathcart Street, Motherwell, builder; J. Wilson, Anwoth, Douglas Street, Motherwell, electrical engineer; J. Taggart, Coradinn, Catherine Street, Motherwell, motor engineer; T. Taggart, Kilnkoln, Catherine Street, Motherwell, motor engineer. The first directors are not named. Secretary: R. T. Ballantyne, 2, Windmillhill Street, Motherwell.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

International Electric Co., Ltd.—Mortgage debenture charged on freehold land, factory and premises at Tottenham and company's general assets, including uncalled capital, dated May 6th, 1920, to secure all moneys due or to become due from company to Williams Deacons Banks, Ltd. Also satisfaction in full on May 5th, 1920 (*a*) of charge dated January 21st, 1919, securing £25,500; (*b*) of mortgage dated February 8th, 1917, securing the sum then due or to become due.

Edmundson's Electricity Corporation, Ltd.—Particulars of £100,000 prior lien debenture stock authorised January 15th, and covered by trust deed of January 13th, 1920; whole amount issued, charged on mortgage debentures in various companies and company's general assets. Trustees: British Trust Association, Ltd.

Lamplough Radiator and Engineering Co., Ltd.—Satisfaction in full on April 30th, 1920 (*a*) of mortgage or charge as collateral security dated September 8th, 1916, securing £12,000, and (*b*) mortgage or charge, dated May 16th, 1917, securing overdraft and general indebtedness.

Siemens Brothers Dynamo Works, Ltd.—Satisfaction in full on May 6th, 1920, of trust deed dated June 10th, 1907, securing £200,000 debentures.

James Keith & Blackman Co., Ltd.—Satisfaction in full of debentures dated October 29th, 1901, July 21st, 1913, and May 11th, 1915, securing £1,300.

National Telewriter Co., Ltd.—Issue on May 12th, 1920, of £130 debentures, part of a series.

Smale & Collins, Ltd.—Particulars of £2,473 debentures authorised April 26th, 1920, whole amount issued; charged on the company's undertaking and property, present and future, including uncalled capital subject to prior charges. No trustees.

Edmundson's Electricity Corporation, Ltd.—Particulars of £75,000 three-year notes authorised January 15th, and covered by trust deed dated April 13th, 1920, whole amount issued; charged on £100,000 prior lien debenture stock. Trustees: British Trusts Association, Ltd.

Herne Bay Gas and Electricity Co., Ltd.—Issue on May 6th, 1920, of £2,600 debentures, part of a series.

Surrey Electrical Co., Ltd.—Satisfaction in full on May 7th, 1920, of debentures dated June 12th, 1919, securing £1,000.

CITY NOTES.

Richardsons, Westgarth and Co., Ltd.

In the course of his speech at the annual meeting, held at West Hartlepool, on Monday, Mr. D. B. Morison said that a dividend of 18 per cent. had already been paid, and a further dividend of 12 per cent. was now due for payment, making 30 per cent. for the year. During the whole of last year only three months were unaffected by labour troubles either in their own works or in the shipyards to which they supplied machinery. Referring to the heavy demands of the Inland Revenue, the speaker said that as provision for efficient production was imperative, there was good reason why sufficient money should be left to them by the Inland Revenue to make good the destructive effects on their plant due to the highly abnormal conditions of working which prevailed throughout the war period. It was not a question of the relative money values of this or that machine before and after the war. The present inflation was simply a passing phase; what they as manufacturers had a right to expect was that the productive efficiency of their plant should be adequately restored. Efficient production was vital to manufacturing success, and, if that efficiency had to remain seriously impaired because of the ravages of taxation, then their manufacturing position would be prejudiced to an extent that could only be revealed, all too late, when they were brought face to face with competition that they might be unable to withstand. With regard to the outlook, they had a very full order book, but, on the other hand, the rate of production was deplorably low. Before the war the standard week was 53 hours, and after making allowance for overtime on the one hand and sickness on the other, the average hours actually worked per man per week were approximately 53. Now, when the standard week was 47 hours, after making allowance for overtime and sickness, the average hours actually worked per man per week was 44. There was thus a net decrease in time worked of nine hours per week per man—or about 17 per cent. Furthermore, and what was worse, the actual time now taken to complete a given amount of work was, on an average, nearly half as long again as before the war. In a business in which a vast amount of highly expensive machinery was employed the effect of such a decrease in its productive capacity as these facts and figures indicated, combined with the corresponding increase in working expenses per unit of work, must obviously be serious. Fortunately there was indications of an appreciation of the undoubted fact that the costs of production were now so extravagantly high that, if the continuous demands for still higher wages were persisted in, commercial success would ultimately become impossible. Demand would then cease, and a slump—and unemployment—must inevitably follow. The desideratum at the moment was the restoration of at least the pre-war output per man per hour.

Calcutta Electric Supply Corporation, Ltd.

At the annual meeting, held on May 27th, the chairman said that the coal position in India was now easier, and they had been able to place new contracts, but the cost per ton had considerably increased. The increased cost of generation and distribution was referred to. Excess profits duty at £61,794 showed an increase of £29,794. The assessments for excess profits duty in respect of the years 1917 and 1918 which had now been received, showed £27,724 over and above the amount reserved for this purpose in the 1918 accounts, and this sum added to the £34,070 reserved in respect of 1919 made the total £61,794. He now placed before the meeting the scheme for a retiring gratuity fund for the staff, which was sanctioned in 1917. They had reverted to the pre-war system of a bonus to employés based on net profits. This bonus had been fixed at 2 per cent. on the 1919 net profits, and amounted to £4,834. The further reduction to a general 3 annas flat rate was put into force from March 1st, 1920. Considering that so many electric supply undertakings had raised their rates, their customers had every reason to be

Digitized by Google

satisfied with the reduction as regards the cost of their lighting and fans. To the company it was a costly reduction, but they looked for increased demands for current at the very low rates now charged. After referring to the proposed bonus share distribution, for which they were capitalising £55,000 of the reserve fund, the speaker discussed the excess profits duty and the new corporation tax. He said it was to be hoped that before long some means would be found to obtain the necessary State revenue by a method which would bear less hardly on those companies whose datum level was a low one. In the case of this company, the increase of profits since 1914 had in no way been due to the war, but to the large increase in business due to capital expenditure shortly before 1914. Apart from the onus of taxation, the prospects were decidedly bright. After five years of stagnation during the war, there were signs of great activity in business in Calcutta, and a corresponding demand for electric power. Mr. Donkin, consulting engineer, visited Calcutta last winter, and he had reported as to the best way of arranging a programme to meet the situation. He recommended a very large and costly extension. Notwithstanding that electric plant now cost just about double what it did before the war, they had decided to order two 15,000-KW. turbo-alternator sets with all accessories, for delivery towards the end of next year. That order, large as it was, was justified, nay, necessitated, by the actual applications for current which had been so far received. In addition, very large extensions of the general system were in hand, including new sub-stations and new cables. The total cost incurred, or about to be incurred, was well over one million sterling. Application had been made for an extension of the already large area of the company's supply, and arrangements were being made for spanning the Hooghley at Cossipore, to enable the new demands of districts on the opposite side of the river to be met. The new expenditure would involve more capital, and they wanted to increase the capital from 1½ to 3 millions, part of which would be required at an early date. They expected to be able to arrange easy terms of payment. In the extensions alluded to no mention was made of such projects as the electrification of suburban railways, and the introduction of tube railways, because although the subject was under discussion, there was, so far, nothing definite to go upon. There were immense possibilities in Calcutta as regarded the demands for electric power, and at no very distant date they might have to come again for still further increase of capital. The chairman briefly referred to the Indian exchange, and spoke highly of the work of the staff in Calcutta contributing to a very successful year in 1919. Mr. Winkfield, the agent and engineer in Calcutta, had retired after 15 years' service, and Mr. J. T. Mertens, for many years deputy agent, had been appointed in his place.

An extraordinary general meeting followed, at which the resolution was passed altering the articles so as to raise the preference dividend rate on the old shares from 5 per cent. to 6½ per cent., raising new capital, &c.

Brisbane Electric Tramways Investment Co., Ltd.

Mr. H. R. Beeton, presiding at the annual meeting, on May 27th, said that the present position as compared with the previous year was that whilst the operating expenses in Brisbane had increased by £30,830, the receipts in Brisbane had increased by £34,220, but British and Colonial income tax had increased by £17,689, and in 1918 a refund was received of £11,414 on account of excess profits duty, whereas last year only £3,486 was received on the same account. There had been increases of wages since October, 1918, of between 12 and 16 per cent., and 10 and 16 per cent. of the total receipts in Brisbane of £468,892, the amount paid in wages on operation account was £209,000. The speaker gave figures showing the growth of the undertaking, and said he believed that they were the only company in the Commonwealth which had not raised its fares. Mr. Badger had felt it necessary, owing to failing health, to tender his resignation, and had left Brisbane. They were keeping his resignation in abeyance, and were constantly getting the benefit of his advice by correspondence. In the extraordinary circumstances prevailing they had appointed a local board. The speaker proceeded to outline the main features of the Purchase Act passed by the State of Queensland for the purchase of the company's undertaking. Most of the electric light business had already been sold. A special resolution was passed recording deep gratitude to Mr. Badger for his long and conspicuous services to the company, and expressing hope for his speedy recovery.

Madras Electric Supply Corporation, Ltd.

Mr. James Gray, presiding at the annual meeting, on May 28th, said that almost every branch of the business had developed during 1919. The chief trouble was to procure plant and materials to connect new consumers. Additional distributing plant was now necessary, and until this was obtainable early next year the engineering staff would be considerably taxed to meet demands. The revenue from lighting and fans increased by £11,262, due, principally, to the ordinary expansion of business, but to some extent also to an increase of An. 1 in the flat rate, which came into force on August 1st, and would operate for a period of three years. The revenue from power increased by the comparatively small sum of £542, but this was entirely accounted for by a reduction in demand for the tramways in consequence of a strike in the spring of last year, which lasted over three weeks. The total revenue showed an improvement of £22,452 on that of 1918. On the debit side of the revenue account there was an increase under every heading, in consequence of the larger volume of business and of the upward trend in wages and cost of materials. The aggregate was £4,469 more than last year. The net revenue account was enhanced by £4,581, the dividend from their holding in the tramway company. The provision for depreciation and renewals had been increased from £9,000 to £14,000, which some might consider excessive. Having regard however, to the greatly enhanced cost of renewals, which might continue for some years, and to the ordinary depreciation of electrical apparatus which prevailed in Madras in consequence of the atmospheric conditions, it was in the best interests of the company to make liberal contributions until a substantial fund had been built up. After referring to the exchange adjustment account, the chairman mentioned the proposed further extensions of mains. They had on order four 250-KW. rotary converters and one water-tube boiler of a similar capacity to those now installed, and it was hoped shipment would be made about the end of the year. Additional mains would be available about the same time. They also contemplated ordering one 3,000-KW. turbo alternator. In consequence of the steady growth of the demand, they had practically no spares when one unit of the plant was shut down for overhauling, and to remedy this and to provide for new business an additional turbo alternator was necessary, but shipment could not be expected in less than 12 months. The cost of carrying out this programme would be approximately £60,000 to £70,000. In view of the improved prospects the directors decided to postpone the issue of new shares until the results for 1919 had been ascertained. Advantage would be taken of a favourable opportunity of placing new capital, and, meantime, temporary arrangements had been made for their requirements. The tramways company again yielded a dividend of 8 per cent., free of income tax. The traffic receipts increased 9 per cent., but expenditure in Madras rose 19.6 per cent., due to higher wages and increased cost of materials. However, the net revenue was sufficient to pay the usual dividend, to make proper provision for depreciation and renewals, and to provide £1,000 for an employés' gratuity fund, also £3,000 for general reserve. Further labour troubles have been experienced in Madras from which the tramways had not been exempt, another strike having occurred on January 26th last, and continued until February 4th. It having been demonstrated that the cost of living had risen in greater ratio than wages, further increases and allowances were made in addition to the voluntary increases which had been granted by both of their companies. Application had been made to Government, however, for sanction to increase the statutory fares, which were framed 28 years ago, when the spending value of the rupee was much greater than at present.

Dutch Companies.

The N.V. Electrotechnische Artikelen (late John Wolff & Co.), of Gouda, has resolved to pay a dividend of 12 per cent. for 1919 out of net profits amounting to 60,000 florins.

The N.V. Nederlandsche Kabel Fabriek, of the Hague, has declared a dividend at the rate of 34 per cent. out of net profits of 707,000 florins in 1919, as compared with 28 per cent. and 582,000 florins respectively in the preceding year.

The N.V. Metaaldraad Lampenfabriek Volt, of Tilburg, has decided to pay a dividend at the rate of 6 per cent. on the cumulative preference shares for 1919. As the company is entering on a community of interests with another undertaking the balance of the net profits for last year, instead of being applied to the payment of a dividend on the ordinary shares, is being devoted to the redemption of the profit participating certificates.

The report for 1919 of *L. Zelander's Electrotechnische en Technische Handels Vennootschap, of Amsterdam*, states that the home demand for materials and motors was not so great as in the previous years, and prices declined, whilst falling exchange rendered it difficult to export at remunerative prices. The net profits permit of the payment of a dividend of 7 per cent. on the ordinary shares, this rate contrasting with 11 per cent. in 1918.

Italian Companies.

The report of the *Società Generale italiana di Elettricita Edison (of Milan)*—the largest Italian electrical company—with a capital of 96,000,000 lire, of which 74,400,000 lire are paid up, gives an exhaustive exposition of the difficulties with which the Italian industry has at present to contend. Reference is made to the scarcity and incredible dearness of materials, daily increasing delay in the execution of work by contractors, disorganisation of transport, continuous increase in the cost, and the demands of workmen. These causes, the report says, constitute a powerful brake on the construction of new plant, with, in consequence, grave shortage in the amount of electrical energy available, to the pitch of sapping the industrial energies of the country. Allusion is then made to the efforts put forth by the Government to help the electrical industry, and the 40 lire per H.P. subvention is characterised as absolutely laughable; with the present cost of materials, it amounts to no more than 5 per cent. of the prime cost. The tariff rises authorised are also regarded as absolutely inadequate in view of the greater cost of working. The report calls for a revision of all these decrees, which should

Digitized by Google

be made more in harmony with existing economic conditions. An acute examination is also given of questions of capital and labour, the evils of workmen's organisations and their fallacious pretensions being thrown into relief. The balance sheet showed a net profit of 9,746,299 lire, allowing of dividends of 34 lire to the old shares to bearer, 34,568 lire among other shares, and 12,766 lire to shares issued during the present year, 107,345 lire being carried to the reserve.

Of similar gloomy tenor are the reports of other companies, and noteworthily those of the Società Industrie telefoniche italiane Diglio (Milan), which, on its 6,000,000 lire capital, was unable to declare a dividend, its net profits being only 80,447 lire. Workmen's agitations and the low output of the labourer are the reasons given. The Officine Elettroferroviarie (Milan), with 8,000,000 lire capital, was only able to distribute 9 lire on its 100 lire shares, the cause alleged being the plight in which the whole manufacturing industry lay, in consequence of reduced production and the agitations of workmen. The Società Anonima Ing. V. Tedeschi (Turin), while distributing 12 lire on its 100 lire shares, also lays strong emphasis on the difficulties of all kinds besetting the working, especially those of labour, which, it says, is becoming daily dearer, and more undisciplined, new taxes, rising exchange, &c.

Electric Construction Co., Ltd.—The net profit for the year ended March 31st, 1920, after providing £6,304 for debenture interest and £10,000 for depreciation is £66,169, plus £38,669 brought forward, less £20,000 paid on account of excess profits duty for the year ended March, 1919, making £84,839. After paying 7 per cent. on the preference shares and 7½ per cent. for the year on the ordinary, both less tax, a bonus of 2½ per cent. is to be paid on the ordinary, leaving £10,663 carried to general reserve (making it £100,000), and £39,781 to be carried forward, subject to liability for excess profits duty. The extensions of the works were only completed in time to permit of their contributing in a small degree to the profits of the past year. The moulders' strike, which lasted for 18 weeks, caused great disorganisation, which will continue to be felt during the new financial year. The enlarged premises, however, will permit of an increased turnover, and the volume of unexecuted orders exceeds that of any previous period.

Peel-Conner Telephone Works, Ltd.—The profit and loss account shows a net profit for the year ended March 31st, 1920, of £31,595. Of this, £10,000 has been put to general reserve and £5,000 to depreciation reserve. £16,595 remains, plus £8,560 brought forward. After paying the preference dividend, a dividend of 2s. per share, free of tax, and a bonus of 1s. per share, free of tax, are to be paid on the ordinary shares, leaving £8,155 to be carried forward. The works have been fully employed during the year. The great amount of orders in hand, as well as the growing demand for telephone equipment throughout the world, necessitates a considerable extension of the works. A site has been acquired near Coventry; factory buildings are in course of erection, and a quantity of plant has already been secured. The necessary funds for these extensions are being provided by the General Electric Co., Ltd.

Austin Motor Co., Ltd.—After paying preference dividends for 1919, a bonus of one ordinary share is given for every two ordinary shares held, and there is carried to general reserve £425,000 to provide for liabilities to the Inland Revenue and to leave a substantial proportion available for other contingencies. With the same object it is proposed that the ordinary shareholders should not take any dividend in cash. Sir Reginald H. Brade (late Secretary to the War Office) has joined the board. The accounts for 1916, 1917, and 1918 are also now presented.

Oldham, Ashton & Hyde Electric Tramways Co., Ltd.—Net profit for 1919 £16,529, plus £4,957 brought forward. To reserve £10,000; 6 per cent. dividend on the ordinary shares; carried forward £5,987. The local authorities have given notice of intention to purchase the undertaking, and arbitration proceedings relating to price will begin shortly.

Bordeaux Electric Tramways Co.—The directors of the Compagnie Francaise des Tramways Electriques et Omnibus de Bordeaux announce payment of dividend as follows: 11,875 frs. on registered shares by endorsement on certificate; 10,756 frs. on bearer shares against coupon No. 33; 297.50 frs. for drawn shares, plus an "action de jouissance."—*Financial Times.*

Brisbane Electric Tramways Investment Co., Ltd.—Dividend of 8 per cent. per annum, free of tax, on the ordinary shares for the half-year, making 8 per cent. for the year. £20,000 to reserve, carrying £38,876 forward.

Cork Electric Tramways & Lighting Co., Ltd.—After putting £6,500 to reserve for depreciation and renewals and £4,000 to maintenance reserve, 5 per cent. is paid on the preference shares and £2,512 is carried forward.

Anglo-Argentine Tramways Co., Ltd.—Dividend of 5s. 6d. per share, less tax, on the 5½ per cent. cumulative first preference shares, being 12 months' arrears to June, 1918.

Anderston Foundry Co., Ltd.—Final dividend 15s. per share, making 18s. per share for year ended March, 1920. £10,000 to reserve.

Cork Electric Tramways & Lighting Co., Ltd.—Dividend of 5 per cent. on the cumulative preference shares for 1919.

Canadian General Electric Co., Ltd.—Dividend of 2 per cent. on the common stock for the June quarter.

Brazilian Traction, Light & Power Co., Ltd.—Quarterly dividend of 1¼ per cent. on cumulative preference shares.

STOCKS AND SHARES.

Tuesday Evening.

Interest this week has been taken up a good deal more by sport than by finance. Nevertheless, the latter absorbs a good deal of attention, and the tone in the Stock Exchange markets is a little firmer than it was. This is due to the expectation that the War Profits Levy will be entirely dropped. On the other hand, cautious people aver that the Chancellor will have to get the money somehow, and that as the Treasury 5¾ per cent. 5-15 year bonds have so far proved a fiasco, more drastic taxation will be introduced later. Accordingly, it cannot be said that the clouds of uncertainty are lightened to any great extent. This being so, it is natural enough that investment demand should run mostly upon the gilt-edged stocks which have been in such favour for the past three or four weeks. Once more it is preference shares which command more support than ordinary, while as for good debentures in well-known industrial concerns, such stocks are so scarce as to make their acquisition a matter of speculation as well as investment.

The dulness of electric lighting shares continues to be a matter for some surprise. This does not materialise into buying orders, and consequently the pressure to sell a hundred or two shares in any particular company has a pronounced effect. County of London ordinary can be bought about 8 or a shade over, and at the level price they show a return of 10 per cent. on the money, while the yield on Westminsters, as already indicated here, comes also to the round double figures. Kensingtons are lower at 4¼, Chelseas at 50s. Why this should be so is a matter difficult to explain, but the fact remains, and investors decline to be tempted with the opportunities offered them in this department.

General Electric 6½ per cent. first preference can be bought at 18s. 6d., giving 7 per cent. on the money, and the 7½ per cent. "B" preference at 19s. 6d. return 7¾ per cent. Vickers 5 per cent. preference, tax free up to 6s., are on offer at 19s., returning 5¼ per cent. net, equal to 7½ per cent., less tax. The company's issued capital is six million sterling, and there are reserves of rather over 2½ millions sterling. Armstrong 6½ per cent. new third preference stand at 18s., affording 7¼ per cent. on the money. Another tax-free investment is the "A" preference of Adelaide Electric Supply. The shares can be bought at 19s. 6d., giving 5½ per cent. on the money net, equal to 7¼ per cent., less tax, and the Lancashire Power Construction 6 per cent. tax free first preference at 19s. 6d. yield 6⅛ net, the shares being convertible into ordinary up to June, 1923.

The remarkable traffics published by the London General Omnibus Company of the number of passengers carried in the Whitsun week, together with the forthcoming developments in the way of extending motor-'buses into the country, and on pneumatic tires, strengthens the impression that the Underground Electric 6 per cent. income bonds are by no means over-valued at their present price of 61½. It is possible enough there may be further reduction in the dividend this half-year, and those who buy the bonds will do so with the intention of putting them away and waiting for better times. Until the company is given power to raise its fares, there is not likely to be much attention paid to the bonds, but as soon as the Undergrounds do get upon a business basis, there will come sharp improvements in the various issues. It is, of course, as a lock-up that the bonds are pointed out as unduly depressed. For income purposes, they hold out little attraction as present.

One of the features of the week is a smart rise in Brazilian Traction Common shares, the price spurting to 54 before any number of shares were dislodged. The price at 53 is 3½ higher on balance. Talk is reviving of the company being able to resume its one per cent. quarterly dividends in the near future. The last distribution made was in January, 1917, so shareholders have been wandering in the wilderness for 3¼ years without any reward for their patience. The shares having been held largely in Paris and Brussels, recent Continental selling included these amongst other securities which the foreign holders endeavoured to melt into cash for what the shares could fetch. It may be argued that even a resumption of 4 per cent. annual dividends would not make the shares particularly attractive at 53, but here again it must be recognised that in the enormous field open for profitable working in Brazil, as soon as the unfavourable conditions become dissolved, prospects will brighten materially. Meanwhile, dollar securities of Brazil and the United States have been hardening up a little after their fall of a week ago, but prices

Digitized by Google

are put up and down, more in accordance, of course, with the movements in rates of exchange than with any particular business in the stocks.

Mexican securities are a little better, although the actual alterations are small. Anglo-Argentine Trams keep their improvement. British Columbian deferred is harder at 45½, and the 4½ per cent. debenture gained ½ at 52½.

Amongst telegraphs and cable shares, a fall of 5 has lowered Indo-European to 35. The price has dropped sharply since the announcement of the reduction in dividend. West India and Panama have recovered a trifle after their heavy fall. The first and second preferences, however, remain about £5 per share nominally, the first having last changed hands at 80s. ten days ago. Marconis developed a fair amount of strength, and at 3 5/16 show a gain of 3/16 on the week. Marconi Marines have risen to 2½.

Callenders are now quoted in their £1 shape, instead of £5 as heretofore. The price at 1½ is nominally 10s. lower than it stood at £8 before the splitting. The preference shares at 18s. 9d. are practically the same as they were before the alteration occurred in them also. General Electric ordinary at 32s. are ninepence better. British Insulated have eased off a trifle, and other movements are of little moment. Rubber shares keep tolerably steady, and with the price of the commodity once more over a florin per lb., there is a slight disposition on the part of the public to pick up shares when the latter come in cheaply. The armament group is fairly hard, but in all the sections devoted to industrial shares, the fear of what effect may be produced upon profits by the 60 per cent. E.P.D. is a predominant factor. Rumour still sports with the idea that the increase of 20 per cent. may be dropped, but no particular importance attaches to this improbability.

Licensing Wiremen.—Most of the principal cities in New Zealand have licensed wiremen for some ten years, and have found that the application of the system was necessary in the interests of satisfactory workmanship. When the Victorian scheme was put before the Australian Electricity Commissioners, who had been empowered by Parliament to make the necessary regulations, they eliminated the clause providing for the licensing of the electrical contractor—the employer, as well as the employé. The regulations were passed by the State Executive Council in March, and the rules came into operation on April 1st last, but already efforts are being made to amend them so as to include the rejected clause, which is considered to be vital to the issue, for it is contended that an employer may place the licensed employé in an invidious position by supplying him with material about which he has scruples. The scope of the examinations for licences may include tests in calculation, practical work, sketching, and knowledge of such rules as may be prescribed, and the Commissioners may determine that oral, written, or practical tests shall be employed. No fees will be charged for examinations or for the licence. The Commissioners may grant licences to wiremen holding licences in another State, providing that the Commissioners are satisfied with the system of licensing in that State. Applicants may be exempt who have passed an equivalent examination held by an approved body.

Static Charges on Motor Lorries.—According to *La Feuille*, motor lorries running between Gabès and Tatouine often become charged with electricity during sirocco storms, and when the drivers grasp the starting handle for re-starting after a stop they are liable to receive severe shocks. The phenomenon is ascribed to the discharge of electrically charged particles of sand on to the chassis, the charge being maintained owing to the good insulation of the vehicle from the ground by its rubber tires. The drivers attach trailing wires to the vehicles in order to allow the charge to flow to earth.—*Technical Review.*

WHAT IS THE CONTRACTOR DOING?

[COMMUNICATED.]

Domestic electrification is in a state of arrested development: not technically, for lack of enterprise and inventiveness cannot be charged against the engineer. He has done *his* part, and has designed a wonderful range of highly-efficient appliances for heating, cooking, cleaning—in fact, for every household purpose involving the use of heat or mechanical energy. Supply stations are partly to blame, because many of them have not encouraged, and some have quite definitely discouraged by the imposition of high rates, the non-lighting applications of electricity.

This, of course, is a serious handicap; but undoubtedly the chief responsibility for the suspended animation of the electrical industry rests on the shoulders of the contractor. After all, it is his business to create a demand for electrical appliances, and once the demand is created, everything else must inevitably follow. The attitude of the average contractor seems to be one of hopeless resignation to an unkind and gas-engineered fate. He does not seem to realise his responsibility in the matter; he cannot see that he is the master of his own fate. And yet there is no doubt but that if the retail side of the business would only bestir itself, we might soon look for that happy day when electric boilers shall be as common and unregarded as the gas ring.

What is the contractor doing to advance electrical interests? In ninety-nine cases out of a hundred, the answer is "Nothing." He opens a small shop, fills the window with a miscellaneous collection of uninteresting articles, such as tumbler switches, ceiling roses, &c., with, perhaps, a single flat-iron and a kettle to give an air of modernity to the display. And then he waits for business to come to him. Occasionally he carries out a small wiring job, and, perhaps, supplies the fittings therefor, although frequently the householder has already bought them from a West-End showroom. But he does not, and apparently will not, regard his business premises primarily as a shop where goods are stocked in sufficient quantities and sold over the counter. Ten to one, if you call on any suburban electrical contractor, and ask for any ordinary heating or cooking device, you will be told that it can only be obtained by placing an order in advance. There may be a single piece of apparatus for demonstration purposes, but even that is doubtful. Sometimes bread and butter articles, like lamps and shades and simple fittings, cannot be obtained.

Bad deliveries, small production, and other manufacturing shortcomings may be urged as an excuse, but the excuse is not adequate. Things were just as bad before the war. The trouble is that the ordinary contractor will not place a stock order for anything beyond a few wiring accessories. It is obviously impossible to conduct a successful retail business without a stock; people simply will not buy without seeing. Naturally enough, when a householder does want any piece of electrical apparatus, he goes to one of the big electrical showrooms in the West End or City, or to a department stores, where he can almost be certain of finding the things he desires to purchase. That this procedure should be necessary is a damning indictment against the contractor, and constitutes a serious hindrance to the extension of electrical service.

It would probably improve matters if the manufacturers of cookers, irons, fans, &c., were to advertise their products to the general public. This would create a demand; but, after all, the contractor has no business to rely on the advertising of his suppliers. He should be able to create and supply his own demand.

The first essential of a successful electrical retail business is, therefore, an adequate stock of every sort of domestic appliance. This would naturally involve capital expenditure, but nothing can be done nowadays without capital; and, in any case, an enterprising man should experience no difficulty in raising the necessary money.

Having acquired a stock the question of disposal arises; and it may be taken for granted that, without some form of publicity, electrical appliances cannot be sold. On the other hand, we know from American experience that properly advertised (and any piece of electrical appliance simply bristles with talking points), these things can be sold with the greatest ease, and with a good margin of profit. Electric cookers, cleaners, &c., are necessarily more expensive than their prototypes, and, therefore, although they may tempt, they do not compel the casual customer. When demonstrated, or otherwise advertised, their advantages are so obvious and convincing, that most people will pay any reasonable price to secure such valuable domestic help. They can be made to consider the transaction, not as an unrelated acquisition, but as a productive investment, with regard to which it would be absurd to grudge ha'pennies in first cost.

How is the contractor to advertise his wares? As a rule, Press advertising will not be suitable because the contractor's field is necessarily local, and local papers are not generally read by the kind of people who are most likely to buy. One very effective and cheap method of advertising is by means of window displays. Not the sort of display indulged in by the ordinary contractor, who appears to imagine that passers-by will be cajoled by a dusty and variegated collection of wiring accessories which remains essentially unchanged from season to season and from year to year. The window must be made arresting, attractive, and convincing, and in order to secure these characteristics there must always be a central point of interest, such as a vacuum sweeper, a washer, or a show of fans or irons, which should be fully described by means of legibly-written cards. It is not enough to mark an article, "Washing machine, 100 volts"—that will never sell a thing costing upwards of £40. The window-card should enumerate the chief advantages of the appliance in such a way that he who runs may read, and he who stays will be, if not induced to purchase, at least convinced that by not doing so he is neglecting a duty to his household.

A lot may also be done with the form (or, preferably, the personal) letter. A carefully-written letter, describing a particular piece of apparatus and mentioning others, and asking for an appointment, will almost certainly bring a considerable number of inquiries, of which a good proportion might, by skilful demonstration, be turned into sales. It is the writer's personal opinion that a great deal of business could be done by simply calling on consumers with small appliances and trying to sell them on the spot. This work, of course, would require a man (or woman) of good address and appearance, who knows the talking points from A to Z. There is little doubt but that hundreds of irons, hot-plates, kettles, fans, &c., could be sold in this way to people who might never enter the contractor's shop.

There is a block of moderately expensive flats in a western suburb of London, in which 90 per cent. of the tenants use electric light, but not more than 1 or 2 per cent. use electricity for any other purpose. These people could well afford to buy and use any of the small appliances suitable for lighting circuits, and a pleasant and persuasive salesman who succeeded in interviewing the tenants (and why should he not?) would do excellent business. A demonstration on site is so much more convincing than in a shop, although, of course, every contractor should possess a well-equipped demonstration room.

The fringe of the electrical appliance business has hardly been touched as yet. It is evident that the contractor is the most potent factor in the problem, and that without his intelligent co-operation the most valuable public utility in the world will stay where it is—playing second fiddle to the enterprising mediocrity of coal gas. The contractor must stock and advertise the things he hopes to sell. To expect to sell them in any other way betokens the foolish optimism of the proverb-maker who said that good wine needs no bush. As a matter of fact, it needs the best and most elaborate bush available.

THE FOREMAN IN THE ENGINEERING INDUSTRIES.

By HARTLAND SEYMOUR.

The exact status and responsibilities of the foreman are, just now, receiving a good deal of attention in the engineering industries. Having held the position of a foreman in a machine shop, the writer is naturally exceedingly interested in the various discussions to which he has listened during the past few weeks.

Apparently the foreman in the engineering industries is the "guide, philosopher, and friend" of the shop operative. His business is to represent the management. Among his duties he is primarily responsible for the discipline of his men, finding jobs to suit these men, and seeing to it that they keep to schedule on the work.

The foremost quality of any foreman always has been, is, and always will be, in spite of scientifically-planned schedules, the knack of handling men. Not that this is the only essential quality of a good foreman—he must know his trade thoroughly, besides which, he should possess teaching qualities, in order that he may impart his knowledge to his subordinates.

He should, moreover, be a keen observer of men and methods, so that on one hand he may be able to size a man up and pigeonhole him for a job, and, on the other hand, that he may be able to suggest improvements in methods of production.

Now that manufacturing processes are becoming more specialised and standardised, technical knowledge is more essential in a foreman. That is to say, in the "line," or military type of works organisation, the foreman was more of an organiser than a technical expert.

In this type of management the foreman was usually trained in the shop over which he was subsequently placed in authority. The fact that he was a better workman than his colleagues, and that he possessed tact and loyalty, usually secured for him the position of authority. Now, however, in the "staff," or functional organisation, the foreman must be a technical expert, so that he can convey the orders of the chemist or the engineer to operatives engaged on that particular line, irrespective of departmental or shop authority.

To fulfil his duties and responsibilities in the latter type of organisation, the foreman must not possess technical knowledge only, he must have executive ability, and be able to impart knowledge and convey instructions in a simple and straightforward manner.

In the "line" management organisations, superintendents, as a rule, preferred to make a foreman of one of their own men—that is, a man who had been trained in their own shops. It is quite obvious that this system possesses many advantages. The foreman will be acquainted with the *personnel* of the works, will understand the various trades in the shops, and will be conversant with the firm's methods. Further, if a man is selected from among his fellow-workmen and placed in authority, it will encourage the others, which is not the case if positions of authority are given to "imported" men. Moreover, each man is then given an objective, so to speak.

The writer very well remembers a typical case of a man in the shops who showed he was suited to authoritative control. This man was a first-class mechanic. But, more than this, he was a born leader. Middle-aged, his sane counsels and foresight were constantly being appealed to by younger and less-experienced men. He was generally called upon to arbitrate in quarrels between the men, he was invariably their spokesman at interviews with the management, and was often consulted by the existing foreman on such matters as discipline and manufacturing methods.

When the existing foreman left, this man was promoted, but the authorities were in doubt about placing him over his fellow men. They considered that jealousy and consequent friction would be avoided if he were placed in authority over another department. However, he was tried in his old shop, and proved a complete success. He is now works manager of the same factory.

Various authorities have declared that the position foreman is one of the most difficult to undertake. When one considers what the majority of managers expect from their foreman, this statement is not surprising. He is considered a very convenient executive to "come down on" if things did not go properly, and some managers did not worry very much if the foreman was provided with the necessary accessories to perform his task in an efficient manner or not.

It is not always necessary for a foreman to be a manipulator, but this quality is always desirable, as a man without it lacks the demonstrative quality when directing operations, which quality is, of course, of more practical utility than any other. Further, the workmen will always respect a man who is better at their jobs than they themselves are far more than they will a man who is an expert organiser and capable of co-ordinating their efforts to obtain the best results, but, at the same time, who lacks the ability to show exactly "how."

Opinion apparently varies from factory to factory on the subject of education as a necessary quality in a foreman. Some managers hold that education is unnecessary as long as the foreman has a thorough knowledge of his trade and possesses executive ability. Others maintain that education is highly important—in fact, is essential in a foreman.

However, most progressive managers, to the writer's knowledge, hold to the former view. That is to say, these managers do not believe that education of a high order is essential to an organiser. Theory alone would not, of course, make a good foreman. Some of the best of this class are men who have been right through the shops from apprenticeship, who have attended evening classes at technical schools, and who are wide readers and students of manufacturing processes and industrial economics.

Foremen, along with works managers, are rapidly becoming more clearly defined—in fact, industrial administration is going to be a definite profession. Some day this will be attained, with degrees and diplomas from an institute formed for the purpose of training organisers on scientific lines, and combining, in their proper proportions, theory and practice.

POWER FACTOR FROM THE BUSINESS MAN'S POINT OF VIEW.

By C. TURNBULL.

Introduction:—The importance of power factor to the commercial welfare of electricity undertakings can hardly be over-estimated. Engineers are now coming to the conclusion that low-power-factor energy must be charged for at a higher rate than the energy taken at unity power factor. The difficulty in doing this is that, so far, it has been found very difficult to explain the meaning of the phrase "power factor" to consumers whose training is of a commercial nature. If one cannot explain it to the consumer, it becomes almost impossible to charge him for it. Engineers have frequently tried to explain it from a technical point of view, but they usually leave the consumer in a hopeless fog, with his mind firmly made up that he will not pay for anything so elusive as wattless current.

In the following article an attempt is made to explain power factor from the business man's point of view. If this method makes it possible to charge consumers for the waste of energy and money involved by low power factor, its inclusion in the columns of the Electrical Review will be justified.

Power Factor Explained Commercially.

If a man were to draw £130 from the bank, and then immediately afterwards return £30, he would be debited with £100. In that respect he would stand in the books just as if he had drawn £100 in the first case, but he would have caused much unnecessary work, and would be a nuisance.

Digitized by Google

Now certain electric motors act like the undesirable bank customer. Instead of drawing their current from the mains, to convert it right away into useful work, during part of a revolution they draw more current than they need, and return the surplus to the mains during the other part of the revolution.

Thus certain 100-H.P. motors will take 130 H.P. for part of the time, but instead of using the extra 30 H.P., like the undesirable bank customer, they keep putting it back into the mains immediately afterwards.

The effect, therefore, is that the mains must have sufficient capacity to deal with the additional 30 H.P. which oscillates to and fro between them and the motor, in addition to the 100 H.P. actually required, making a mains capacity of 130 H.P. altogether.

An ordinary measuring instrument, in fact, shows a consumption of 130 H.P., but a specially-designed instrument discloses the fact that 30 H.P. is what may be called an oscillating power; that is, instead of being used, it passes into the motor for a short time, and immediately afterwards passes from the motor back again into the mains.

It is, in fact, like the £30 which the man drew from the bank in excess of his requirements, but which he immediately returned.

The banks have recognised that such transactions should not pass without charge. The man who pays, say, £10,000 into the bank, and draws out £11,000 by numerous cheques, leaving an overdraft of £1,000, pays more bank charges than the man who gets a clean overdraft of £1,000. In short, a bank customer pays on his turnover, and not merely on the balance.

Suppliers of electricity have found out that they must follow the precedent set by the bankers. If two consumers have 100-H.P. motors, and if the motor of one takes a clean 100 H.P. from the mains, while that of the other takes an additional 30 H.P., which it immediately returns to the mains, then the first one must have a lower rate than the second.

For the imperfect type of motor the electricity works must lay down, in some cases, hundreds of thousands of pounds'worth of plant which produces no useful effect, but which is merely occupied in dealing with the useless power which oscillates to and fro from the mains to the motors, and back again from the motors to the mains.

To this explanation we may add some technical terms, which consumers will find useful.

The power factor of a motor is the correction which must be applied to give its real power. Thus in the case of the motor which takes 100 H.P. from the mains without any oscillating power at all, the power factor is 100 per cent. All the power is used.

Where the motor takes 130 H.P. from the mains, while it returns 30 H.P. back again as an oscillating power, the power factor is 77 per cent. The reason for this is that if we take 77 per cent. of the apparent power, namely, 130 H.P., we get 100 H.P., which is the real power which the motor absorbs from the mains.

Turning to our analogy, if a bank customer continually presented cheques for sums of £130 at a time, and immediately returned £30 before leaving the bank counter, he might be called a 77 per cent. man, because he only took out 77 per cent. of the money indicated on his cheque.

Users of electric motors may naturally ask if they cannot get motors which will use the energy directly without developing an oscillating current. The answer to this is not only that such motors can be got, but that the imperfect type of motor can be corrected so that it will work without oscillating currents. While these improvements cost money, they bring about a great saving in the cost of supply, which is naturally beneficial to users of electric motors.

These facts have been set out to enlist the sympathies of consumers in the problem, and to get their help to reduce the cost of energy. If the supply authorities have to deal with motors which, as many do, return to the mains as much as half the current which they take, then the plant which supplies the current must cost something like double the money that it would cost if the motors were efficient. Efficient motors mean economy in supply, and that means, what everyone wants—CHEAP ENERGY.

GAS TURBINE DEVELOPMENT.

THE development of an efficient commercial gas turbine is a problem of much interest. In his contribution to a recent discussion at the Institution of Electrical Engineers on the use of producer and blast furnace gases for power production, Mr. Lymn mentioned experiments that had been carried out in Germany on the Holzwarth gas turbine since 1914. We are now able in what follows to give further details of these investigations.

Shortly before the outbreak of war tests were commenced on a 1,000-H.P. vertical gas turbine built by Messrs. Thyssen and Co., at Mülheim, Ruhr. The tests were discontinued during the war, but recommenced in 1918. The Thyssen turbine does not differ in external appearance from the machine previously built at Mannheim, but differs from it in several particulars of design. The tests aimed at the evolution of a simple and effective gas turbine capable of being manufactured in large units, but with a lower cost of production than the steam turbine, including its steam-raising plant.

According to the *Journal* of the American Society of Mechanical Engineers, in which is abstracted Hans Holzwarth's article on the subject published in the *Zeitschrift des Vereines deutscher Ingenieure*, higher charge and explosion pressures were adopted to increase the output per cubic unit of chamber capacity and the thermal efficiency. The average explosion pressure for continuous operation was raised from 12 to 14 atmos. abs., compared with 5 to 6 in the Mannheim machine. Holzwarth thinks it possible to raise this figure still higher by increasing the charge pressure above 2.3 atmos. abs. Curve 1 shows the thermal efficiency (producer gas of 500 kg.-cal. per cu. m.; temp. of mixture, 77 deg. C.), and curve 2 the specific output of the Holzwarth gas turbine (assumed to be free from losses) as a function of the charge pressure previous to the explosion.

The combustion period of the gas turbine is now 0.1 sec., compared with 0.33 sec. for large 90 R.P.M. gas engines and 0.02 sec. for 1,500 R.P.M. aero engines. Fundamentally there is nothing to prevent reducing the expansion period still more, but it would involve an increase of the nozzle cross section, which in turn would lead to an increase in blade length and in flow resistance.

Decreasing the period of expansion increases the pressure on the blades, and the jet in explosion turbines, unlike a steam jet, acts intermittently for short periods, and is of the character of a blow. Because of this new blade shapes and fastenings had to be developed to withstand the added stresses. The blade caps, blades, and blade roots were designed in one piece, as in the De Laval steam turbine, which design has given satisfactory results.

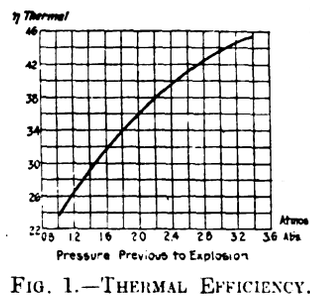

FIG. 1.—THERMAL EFFICIENCY.

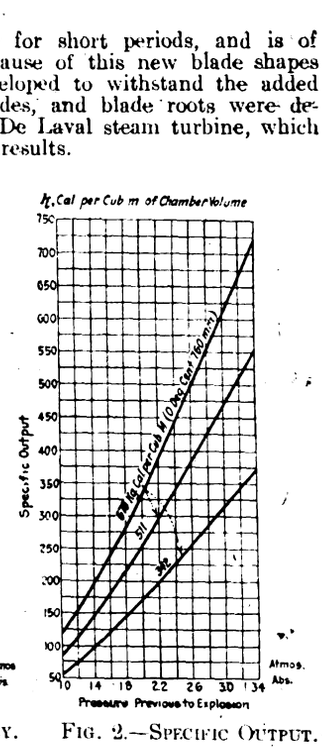

FIG. 2.—SPECIFIC OUTPUT.

Long and expensive tests to determine the most suitable material for the blading led to the adoption of mild electric steel; with proper heat treatment blades of this material proved very satisfactory. Table I shows the physical properties of this steel from tests made at the Technical High School, Stuttgart. While blades made of harder or alloy steels rapidly show changes in structure of the metal, cracks

Digitized by Google

and fissures, electric steel appears to be capable of withstanding wear and is also resistant against surface corrosion and erosion, provided, however, no substantial amounts of wet steam or water are present in the gases of combustion. The chief difficulty in gas turbines is caused by deterioration of the blades and wheels owing to the high temperature necessary, 600 deg. C. and over, and metals used must be reasonably indifferent to changes of temperature and the action of the gas. Figures relating to other tests made in Germany on alloys for the same purpose are given in the *Mining Journal*, and it is shown that the material which is considered to have the best prospects for use on a large scale in the construction of gas turbines is a nickel-chrome steel (74 per cent. Fe, 20 per cent. Cr, 6 per cent. Ni, 0.3 per cent. carbon). At 600 deg. C. its strength was 47 kilos., with 19 per cent. ductility, and an elastic limit of 16 kilos.; at 700 deg. C. the strength was 24 kilos. and the ductility 7 per cent.; and in an air bath at 700 deg. C. the surface remained free from scale.

With regard to nozzle shapes, on the whole it was found that steam turbine experience applied within reason to the design of gas turbines. Thorough tests on nozzles showed the De Laval type to be satisfactory, provided the angle of

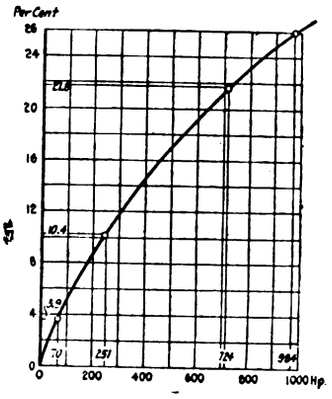

Fig. 3.—Total Efficiency.

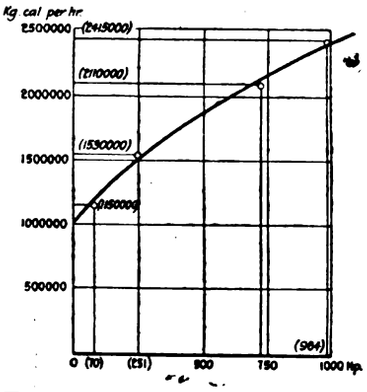

Fig. 4.—Total Heat Supplied.

outlet is kept as small as possible. The rate of combustion and scavenging were improved by the use of an oil pressure loaded nozzle valve.

If the instantaneous maximum jet velocity at the beginning of expansion is in the neighbourhood of 1,500 m. per sec., more than 95 per cent. of the mechanical energy of the gases of combustion is available at the wheel up to the time when the jet velocity decreases to about 1,000 m. per sec. This means that more than 95 per cent. of the energy is available at jet velocities varying 19 per cent. either way from the average jet velocity for which the nozzle and blading have been designed. Practical experience confirms these theoretical considerations. Efficiencies of about 55 per cent. (*i.e.*, about 55 per cent. of the output attainable in a gas turbine free

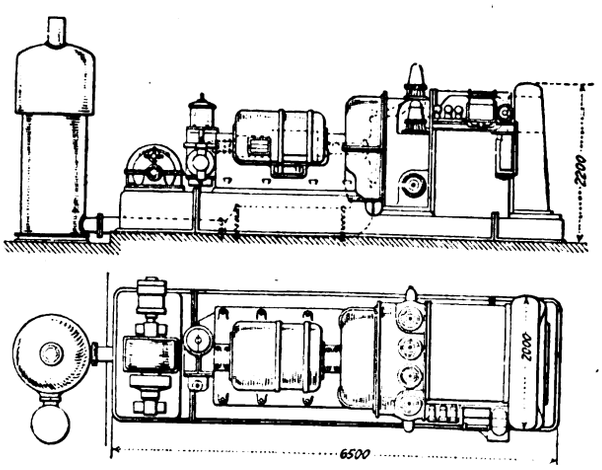

Fig. 5.—A 500-h.p. Holzwarth Gas Turbine.

from all losses) have been indicated on the periphery of the wheel. In gas turbine practice the lower limit of the heat drop is predetermined and for practical purposes so are the peripheral velocity and number of stages. On the other hand, the designer is free to vary the upper limit of the heat drop, and through this the important ratio (jet velocity) : (peripheral velocity) without materially affecting thereby the thermal efficiency of the turbine.

A 4-hour test was carried out in December, 1919, with a gas turbine coupled to a D.C. generator connected to a water rheostat. Coke-oven gas having a calorific value of 3,860 kg. cal. per cu. m. (432 B.TH.U.) was the fuel used. The results are shown in Table II. In the present tests all the combustion chambers were in operation, but in future the governor gear is to be arranged to cut out certain combustion chambers, thus increasing the efficiency on partial loads. Fig. 3 shows the efficiency as measured at the wheel periphery, and fig. 4 the heat supplied, as a function of the power output at the wheel to the turbine per hour. The work consumed in compressing the blast air and gas amounted to 5.7 per cent. of the exhaust heat, so that the power consumption for the blowers can be well taken care of by exhaust heat.

Gas turbines of the horizontal type appear to be preferable in several ways; working parts are more accessible, and the generator can be kept separate, and it is intended in the future to build only this type.

TABLE I.

	Tested at	
	Room temperature	450 deg. Cent.
Yield point, kg. per sq. cm.	{ 4,204 / 3,185 }	1,975
Breaking load, kg. per sq. cm. ...	4,510	2,675
Elongation, per cent.	27·2	50·2
Contraction, per cent.	73	88·4

TABLE II.

	1	2	3	4
Gas consumption, reduced to 0 deg. Cent., and 760 mm. mercury pressure, cb.m. per hour	300	400	550	630
Heat supplied, cal. per hour	1,150,000	1,530,000	2,110,000	2,415,000
Power output at wheel periphery, H.P.	70	251	724	984
Heat consumption, kg-cal. per H.P.-hour	16,430	6,090	2,915	2,450
Efficiency (periph.) per cent.	3·9	10·4	21·8	26

Fig. 5 shows the outlines of a 500-H.P., 3,000 R.P.M., oil-fuel gas turbine now under construction to drive a D.C. generator. The blower and exciter are built on the same base as the main machine, and directly-connected thereto is the exhaust-heated boiler delivering steam for the blowers. The installation is for the Prussian railway administration.

The original article gives drawings of a 12,000-KW. gas turbo-generator set, and of a 3,300-KW. gas turbine together with blower and waste heat accumulator. It may be added that during the war it was rumoured that a high-efficiency gas turbine had been developed by the Augsburg-Nuremberg Machine Co., but so far the rumour has not been confirmed.

THE ELECTRICAL EQUIPMENT OF ARTISAN DWELLINGS.

At a meeting of the North Midland Centre of the Institution of Electrical Engineers at Leeds, on May 11th, Mr. Leonard Milne read his paper on the above subject. This paper was abstracted in our issue of April 9th.

In opening the discussion, Mr. T. B. Johnson (Leeds) said that up to the present he had been under the impression that whereas electricity was obviously the best means of lighting a house and providing such small domestic comforts as electric heaters, ironers, and vacuum cleaners, yet when it came to heating, gas was more economical. The Fuel Research Board recently published a table showing that the cost of 100,000 B.TH.U. with gas at 4s. 2d. per thousand feet was 10d. per thousand; and with electricity at 2d. a unit was 58d. That was six times as much for electricity as for gas. They did not want to go too far in recommending electricity if there was a better way. When they wanted a fire for a short time only, they could get the gas fire at a suitable heat much more quickly than they could get an electric radiator of similar size. If they could get the open fireplace completely abolished, the gain from a health point of view would be enormous. If they must have the coal fire kitchen range, he thought that was the means whereby they should get the supply of hot water. He thought the author in some instances had gone too far in the way of saving first cost, and would lose money in subsequent maintenance. The author proposed to dispense with switch drops, and to place a combined switch and ceiling rose on the wall near the ceiling level, and to operate the switch by a cord or rod

Digitized by Google

attachment. If that was done, the maintenance costs would soon wipe out the saving on the twin flexible, which was only 40 per cent. on a small sum. The author proposed that the supply from house to house of a group should be made by means of bare overhead wires. There, too, the initial saving would be wiped out by subsequent troubles in maintenance. Where telephone wires were wanted, bare telephone wires and bare electric wires did not go together. The author's suggestion that a group of houses should be taken, and a common charge made on the occupiers, would be quite unworkable. When a number of people shared one meter, even in one firm, there was everlasting trouble in finding out where there had been excessive use of current.

Mr. W. Wraith (Leeds) remarked that the idea of having these groups of houses was a very economical one, and ought to be applied. He did not agree that an extra charge should be made for small domestic apparatus. The electric iron and anything of that sort usually took only a very small current. Electric heating was not as cheap as fiers were now. In his office he had an electric radiator which in the winter took two kilowatts to keep the room fairly comfortable the whole day. The cost at the old price, ½d., was 8d. for the day, whereas a bucket-full of coal at 8d. lasted them two days.

Mr. W. H. Brown (Shipley) was dubious as to the desirability of the lightly insulated neutral wire, particularly if one came across damp cellars or anything of that sort. It was liable to lead to all sorts of trouble. The voltage of the neutral was not usually much above earth potential, but he had found that in the case of a fault coming on, under certain circumstances, there might be a very considerable increase of potential between earth and the neutral wire. Having one meter for a number of houses might be found quite suitable in the majority of cases. He gave a copy of the paper to one of his workmen, and asked him to talk the matter over with his wife; she thought this electrically-equipped house would be a fine thing if it could only be done; but she said that the gentleman who wrote the paper had entirely forgotten about the washing day. They wanted as much hot water then as they did for the rest of the week. The woman was also up against the idea of having "this chemical business," as she called it—the nitrate of soda and that sort of thing—when the kiddies were about. The question of cost came in. Who was to provide this electrical tackle?

Mr. Davidson (Leeds) said the cost of wiring with twin wires for a heating plug was given as about 18s.; the cost of a moderately good combined switch plug to-day, without any wiring or anything else, was in the region of 18s. Only a few days before, he had to cost up 500 houses on one estate. Those houses were to be wired in screwed tube, with C.M.A. cable, complete with opal shades and lamps, and the prices as they worked out were: For a seven-light house, lighting only, £22 5s.; 8 lights, £25 10s.; 8 lights in blocks of four, £29 10s. per house. The variation in those prices was due to the cost of interconnecting mains. The supply authority proposed to put in one service for each pair of houses, and one service for blocks of four, and it was suggested to interconnect inside by 7/16 mains. Those were the lowest prices at which the work could be carried out. Cleat wiring he did not agree with at all; after the houses had been occupied a week, the wires in the kitchen would be used for hanging up the clothes, and the cost in repairs would be very heavy. The lamps should be fairly high, and probably in the living room should be suspended by a tube rather than a flexible cord. It was desirable that there should be a separate meter for each house; it would encourage people to use special apparatus such as washing machines, irons, and so on, if they could afford them. It was also very desirable to put in a very good type of switch, and that switch should be earthed. The average cost of a house was in the region of £1,000, and if £20 to £25 of that was spent on electric lighting it was a very low figure. The cost of an oven with hot plates suitable for the Yorkshire wife was considerably higher than the cost of the chimneys in the house, which the author gave as £25.

Mr. Innes (Leeds) asked what the author took as the cost—the net cost to the contractor, or the cost to the builder?—Mr. Milne replied that the cost was the price that the contractor would charge, and provided for his establishment charges and profit, for which a provision of 20 per cent. was made. Mr. Innes observed that dealing with it from that point of view, in close-joint conduit with continuity fittings, he did not think the author would to-day be able to do it at anything approaching the cost he had given. His firm was carrying out work at some of those houses, for which the cost was given at 29s., including lamps and fittings. It worked out at that without lamps and shades, and only the cost to themselves. His firm had carried out a good deal of cleat wiring for the Office of Works, but were not satisfied with it; the Corporation would not allow it except as a temporary expedient. After it had been done for a short time they found the wires sagging in all directions. They could considerably cheapen the wiring by the use of a combined switch and ceiling rosé; it would practically do away with inspection fittings and tees, which were to-day costing more than 50 per cent. of the cost of the tubing. As regarded the special flexible, the total saving was not a very serious item to put against the danger which would come about through careless workmen putting thinly insulated flexibles on the live side, or by the owners themselves tinkering with the wiring. As regarded working in conjunction with the architects and builders, it certainly should be done in every case, but it was not, because they often came on to the job very much too late. With regard to service, in a block one service was quite sufficient as a general rule, in a central position. He did not think the running of overhead mains between the blocks could be recommended. In many cases they could dispense with meters where lighting only was required. Two meters ought not to be necessary, if some system of charging like the rateable value system was adopted, he thought it was certainly the best system. There was a big future for electric cooking, once they could educate the public to know that they could save actually on the food alone in cooking; but the people they had to educate in the first instance were those who had the money to pay for the apparatus. The people who were building the artisans' dwellings would not be justified in going to the expense of putting electric cooking apparatus in. Electric washers were very expensive, but no one who had used one would be without one. With regard to heating by electricity, the present type of radiator got hot within a minute, and he did not think they could expect anything quicker than that. For continuous heating it might be more expensive than gas, but for rooms only used for short periods, he did not think there was any question about its being economical, provided they could educate the people into using it in the proper way. He agreed that the best way of getting a hot water supply would be by a separately fired boiler, with anthracite or coke, which was the most economical method they could find, and would probably solve the problem of getting plenty of hot water on washing day, as well. The experience he had had of the thermal storage system so far was unsatisfactory. For linen cupboards a small, low-temperature heater taking about 100 watts was fairly economical. The people they had to educate to the use of electricity first were those who had the money to spend on the apparatus, and they were educating them in that direction with very little trouble, for those electric helps did away with the dependence on servants, and people were becoming more and more converted to their use.

Mr. H. Moss (Bradford) could not see how a house could be wired at £14 in close-joint tubes with continuity fittings. Overhead mains were highly satisfactory for distribution from house to house when blocks of buildings were being put up together; and it was far cheaper than running supply mains through basements in a row of houses. He had been connected with installations where they had adopted overhead mains, cheapening the cost considerably. The wires could be put out of the way by running on the backs of the houses, and would be far more out of sight than if run along the chimneys. In a case he had in mind there were telephone wires; there had been an electric supply for the last ten years, and he had never heard yet of any difficulty arising through the telephone wires coming in contact with the lighting wires. Every customer should pay for what he used, and must have a meter. There were numbers of consumers who would buy these meters outright rather than pay the rental year after year. In the paper the use of all kinds of electric apparatus was advocated; they would have to have separate meters and let those people who used electric radiators and irons pay for what they used. When the author came to suggest that a 9-light installation could be put in for £7, an average cost of 16s. 9d. per light, and that radiator plugs should be put in for 18s. per point, he thought it was impossible to put in wiring that would pass any regulations for that figure. £5 per plug was a common price to-day for radiator plugs in houses, and he did not see how they were going to reduce that price. The smallest radiator it was safe to wire for was a two-unit. They must have cables to suit, a switch of ample capacity, a suitable plug, and separate fuses. It would be a long time before they got electricity adopted universally for heating and cooking in artisans' dwellings.

Mr. Adams observed that gas or electricity had to be put in; the electric installation would be more expensive, but the cost of the gas installation should be taken off that. With regard to co-operation with the architects in building, if they would put wood plugs in and make the runs properly they would considerably reduce the cost in tubing, and tubing would quite easily be put in if all the runs were made out. As regarded the leading-in wires, the overhead proposal had great weaknesses in the way of faults and leakage. Would not it be better to have some system of block wiring, similar to that which the Post Office used at the present time in a large building? The supply was brought up to a pot head outside and branched off to the various offices. A flat rate would undoubtedly lead to extravagance. If £25 would be saved by not making chimneys, an electric installation could be put in for that, therefore why economise on the installation? If they put electric installations in which appeared to be cheap but were not cheap, and did not last, they would do harm to the electrical trade.

Mr. Pickersgill (Cleckheaton) said the Council at Cleckheaton expected to put up 300 houses on the garden city plan. The question of wiring the houses and how the service was to be run was rather a moot point. Going in from the chimney points did not seem to him to be feasible so far as their area was concerned, owing to the sulphur and acids in the air which came up from the dyeworks. The wires would soon be corroded. One man quoted him £5 a light to do about 40 lights in a motor garage. He got it done for

Digitized by Google

32s. per light, twin lead-covered wire, and a good job too. Five years ago they could wire for £1 a light. They were coming now and wanting £3 a light. They all knew the cost of material had gone up, but it had not gone up as much as the wages and the drop in the amount of work done for the money. Until they could get the workman to do more work in the time, now that he had got his hours lowered, they could not reduce the cost.

Mr. REID (Morley) said he was connected with the housing scheme at Morley, and he would like to point out that the most important question had not been touched upon at all in that discussion. The Housing Commissioner was the most extraordinary barrier to progress. He found that they had got gas in for £12 for a seven-point installation. Unless an electric installation was going to compete with that, he thought it would be almost hopeless to induce the Housing Commissioner to accept it at all. He would propose to bring the wires to the eaves of the buildings, which were mostly about 15 ft. 6 in. from the floor level, and then lead them down to the first-floor level, and take them below the ceiling level through the wall, put the replacement fuses there and the meter, and from there take the wires through the underdrawing, and for the ground floor drop ceiling roses at the various points required. The other points on the first floor, for the bedrooms, might be on the wall sides like gas brackets, and the only switches in the building would be the replacement fuses and a switch at each lampholder or the ordinary key switch. Some years ago he installed lamps with cord attachments to operate them from the ceiling rose, and they proved a complete failure, even with rod attachments. For the bedroom lights there might be, in place of the key switch, ordinary light dimmers or resistances with the combined switch arrangement mounted on the wall-bracket base or on a common plug, which would reduce the cost considerably. Regarding the cost of doing away with chimneys, he did not agree with the author. The average artisan was educated to use the ordinary grate and get plenty of hot water from the ordinary fire and set pot. Regarding gas-heated geysers, three of them were installed at a hospital in Morley, and they were never satisfactory. With regard to cooking apparatus, he did not think those would come in, although he had installed quite a number some twelve years ago at Calcutta, amongst a community educated to the use of electricity. They were not of the artisan type, and they proved quite a success. Open cleat wiring was also a success, and if they could install that in a place like Calcutta where the climate was very damp and the walls got damp, it should suit any other climate. There were practically no fires from cleat wiring; they used to use cleat wiring and tapeless cable manufactured by the General Electric Co., and they all proved quite successful.

Mr. JESSOP (Bradford) said with regard to the author's suggestion to use switches and ceiling roses combined, or fixed together, he had fixed thousands of them in factories, and had some thousands under maintenance at the present time; he found that those switches would last four or five years without any maintenance. That was the usual Wadsworth Tucker fish-tail type with a couple of chains attached. In addition, he liked to put an additional chain on to hold the weight of the lamp, and he did not see any objection to using that in an artisan's dwelling. The artisan had been accustomed to going to the gas and turning on a tap. Relieve him of the match, but give him the tap, and he thought they would make a good job there. With regard to collaborating with the architect, he thought if they did that, contractors would find that it would cost them more, because the architect would put a condition in the contract that as the building was going along they would have to send a man to put in the plugs for the switches. If he put it on to the builder, the builder was going to charge an exorbitant price, because in turn he had to turn it over to his bricklayer and leave him to measure out the exact position and put it in. They had had to do it for some architects, and had to have a man on the job watching the bricklayer. With regard to metering, there was one system that had not been dealt with—the lighting of these artisans' dwellings from A.C. supply, using a condenser for limiting the current. He had had opportunities of inspecting some houses which had been done on that system, and with a charge of 6d. per week the company supplying electricity made a profit. The house had five or six lights, with 50-C.P. lamps in the living rooms and 30-C.P. in the bedrooms, which he thought was equal to what they got with the ordinary incandescent gas. In those houses they had a considerable saving in the charges for meters. He had asked one of the ladies resident in the houses, an ordinary workingman's house, if she was satisfied with the light, because he thought a 50-C.P. lamp would not be sufficient. She said that she was quite satisfied, and preferred the light far above gas. The wiring for that could be done almost entirely with single wiring, simply running a single wire in series round the whole of the house. Instead of being switched out the lights were short-circuited. They could put in a good quality wire, and certainly the cost of seven lights including a condenser, reasonable shades, and lamps, would not come to over £10 10s. for a seven-light installation. For D.C. supply he did not see why a reasonable current limiter should not be used instead of a meter, that would limit the supply, say, to two 50-C.P. or one 50-C.P. and two 25-C.P. lamps.

Mr. FIRTH (Dewsbury) supported the two speakers who had mentioned the question of comparison of costs with gas and the question of the Health Commissioner or Building Commissioner. In Dewsbury there were probably two hundred houses to be built, and they had come on the scene after the prices had been fixed. They had to compete against 12s. 6d. per point for gas. The lowest figure came out at about 25s. per light.

Replying to the discussion, Mr. MILNE agreed that gas was more economical than electricity for heating, but he did not think the question of economy in running cost was of any importance whatever as regarded the heating of such rooms as bedrooms, where the heating would possibly be used for one night in the year. He did not think that they could advocate the electrical heating of rooms that were in constant use. The important point was that if they used gas they must have flues, and practically did not save anything at all on their building, and they had to provide gas stoves for the bedrooms. An electric stove could be carted in when it was wanted, hired from the landlord, and fixed without any noise or fuss at all. They could not do that with a gas stove, it must be permanently fixed and bought and paid for by the landlord. He did not think the maintenance would be at all heavy if the scheme was carried out in its complete form, for the reason that none of the wiring was within hand-reach, and if a cleat wire was run along a ceiling it was not going to be touched except maliciously. Of all the small economies that he had suggested, the one that effected the largest saving was the doing-away with the switch drops. That saved an enormous amount of labour. They should spend money in the factory; and not on the job. One or two speakers had suggested that the thing was not safe. Experience was against that. He could not find that any speaker had ever brought forward at any of the meetings they had had a suggestion that a fire had been coincident with the development of a fault on a system, and surely that must have happened if the want of insulation on the neutral side was a danger. In nine installations out of ten the insulation on the neutral side of a three-wire distribution was practically nil, and when they had to put a neutral side on to an outer, they blew fuses time after time. Artisan dwellings had no cellars at all. Those who had had experience of overhead systems in villages did not find that their bare services were a heavy cost for maintenance. In some cases it might be advisable to run under the eaves and not on the chimneys, and, indeed, in some cases to run through the false roofs of the houses. Each case would have to be dealt with on its own merits. If they looked at the figures which he had suggested for hot water they would find that very fair provision was made for ordinary washing. When he started his paper he thought that the electrical heating of water was not a commercial proposition at all. He was astonished to find that the electrical heating of hot water was cheaper than a separately-run anthracite stove for a small house, and also cheaper than a gas geyser if they provided a pilot burner. If they cut out the pilot burner it was not, but then they had not got anything like the facilities. If one made a comparison between the two, they must make it with a gas geyser fitted with a pilot burner, and he had found to his astonishment that the gas-heated geyser was dearer than an electrical heater. This subject of heating water merited very much greater consideration than had been given to it at present. The figure of 18s. per point for wiring plug points was perfectly sound for the time at which it was given—last autumn. It had to go up because wages had risen, and material had risen a little. It was based on the twin wire that he was suggesting. It would cost a bit more if it was run in a tube or casing or even lead-covered wire. He had allowed for a bed-room, which was a very small room, 1 KW.; and in the scullery, where cooking might go on, 2 KW., and taking the average price all round, it worked out at 18s. per point, providing 20 per cent. for contractors' establishment charges and profit. He did not include in that price the control apparatus of the stove. The prices given for the cost of screwed tube were considerably above his figures. They pointed to the importance of introducing some cheaper form of wiring if they were going to get this work at all. If they had to charge anything like £22 to £29 for wiring an artisan dwelling to-day for lighting only, they would not get it. The landlord, it seemed to him, should bear the cost of cooking apparatus, just as he bore the cost of a coal range, if a range was put into the house. He had found in village supplies for which he was responsible that in some cases where a fixed charge was being made there had been gross extravagance. That sort of thing would have to be stopped. The system he proposed was not going to be unsightly; the wire was about half the diameter of a pencil, run on small cleats close up to the ceiling. It would be very inconspicuous indeed, and distempering would not do any harm. The figure given by Mr. Reid of the cost of the gas installation of seven lights at 12s. per light showed that if they adopted one of those cheap forms they could cut under that price easily. Of that he was convinced. The proposition they wanted to put forward was this: that they could provide the whole advantages of an electrically-equipped house, and save money on the job. They could cover the whole cost of their electrical installation by the saving which they effected in the buildings. When they came to 1,000 or 500 houses of the same pattern, it was worth their while to go carefully into the plan with the architect and fix the positions in which they wanted their fixing blocks.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

The "Ibsco" Battery Steamer and Still.

A simple combined pure water condensing still and generator for steaming the interior of pitch-sealed accumulators preliminary to opening them out for inspection has recently been introduced by the BAILEY-DRAKE CO., of 1,120, South Michigan Avenue, Chicago, U.S.A. The now large and almost universal use of electrically-started and lighted motor vehicles indicates that there is a corresponding scope for apparatus of this kind, at least in garages where motor vehicles are stored and maintained in running order.

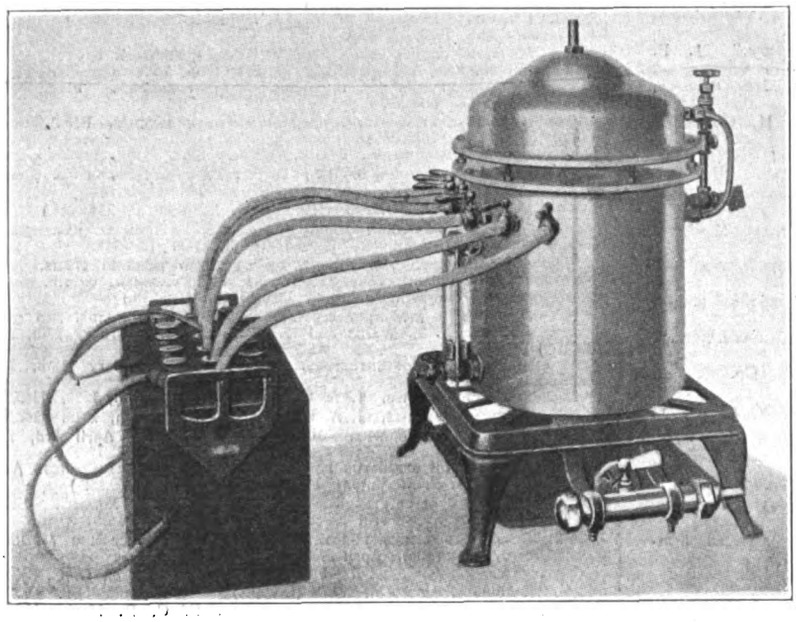

FIG. 1.—THE "IBSCO" BATTERY STEAMER AND STILL.

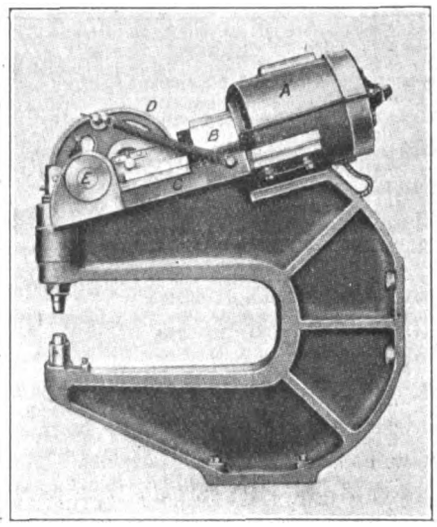

FIG. 2.—"REMCA" PATENT ELECTRIC RIVETER.

As will be seen from the accompanying illustration (fig. 1) the apparatus consists of a cast-metal base for a Bunsen gas or other burner, a generator, 18 in. by 10 in., with taps and pipes for leading into the vent plug holes of the respective cells for softening the pitch preparatory to exposing the plates, and superimposed under a cover a coil-still made up of 5 ft. of ⅜ in. soft copper tube, the combined generator and still being 21 in. high. The details are of 14 gauge seamless spun aluminium and brass. A low-pressure safety valve and level gauge glass are fitted, and provision made for hand-feeding the generator by connecting it up to a service supply. There is also a load from the still as an outlet for the distilled steam-water into a glass vessel. The weight of the apparatus ranges from 8 to 12 lb. Four varieties are made, viz., with combined steamer and still as illustrated, (2) automatic steamer without still, (3) steamer and still not automatic, and (4) the steamer only.

A Patent Electric Riveter.

The advantages possessed by the electric riveter over the pneumatic and hydraulic types are many and varied. Among them may be mentioned the absence of auxiliary apparatus, and the small power consumption leading to reduced costs. The MADA ENGINEERING CO., LTD., 12, Bevington Hill, Liverpool, are the makers of the "Remca," a very compact and efficient riveting machine shown in fig. 2. Referring to the illustration, A is a magnet with a plunger B attached to the end of which are side plates bearing three rollers. When the circuit switch is closed the plunger is attracted into the magnet, and the rollers are drawn back along a slide C, and the top roller forces a cast steel lever upwards, causing it to rotate about a pin E. The opposite end of the lever pushes down the riveting ram F, to which is attached the top die for forming the rivet head. When the power is switched off the moving parts are returned to their original position by means of springs. Tests have shown that a ⅝-in. iron rivet can be snapped up with a current of 16 amps. at 230 volts D.C. in 3 seconds. This means that one B.O.T. unit is sufficient for 300 of such rivets.

A G.E.C. Turbine-driven Alternator.

Among the plant installed at the Berthlwyd Colliery, Gowerton, by the GENERAL ELECTRIC CO., LTD., was the new turbine-driven alternator shown in fig. 3. The turbine runs at a speed of 3,000 R.P.M., and is directly connected with a 1,000-KW., 3,000-volt, three-phase, 50-cycle alternator. The power factor is .8, and the alternator will maintain a 25 per cent. overload for two hours without excessive heating. The conductor insulating tubes are of micanite moulded on to the coil. The complete coil is pushed through the slots from one end, and for this purpose one end of the coil is left straight. To prevent any movement of the conductors or coils heavy metal clamps with spacing blocks are placed round the windings. The rotor is one solid forging which gives it great mechanical strength. The rotor winding is made up of coils which are completely shaped before they are embedded in slots milled out of the solid drum. The turbine, of compact design, is of the impulse type, and the exhaust steam is dealt with by a Cole, Marchent & Morley condenser. The circulating and air pumps are driven by a 3,000-volt, 50-cycle, 3-phase "Witton" motor of 55 B.H.P.

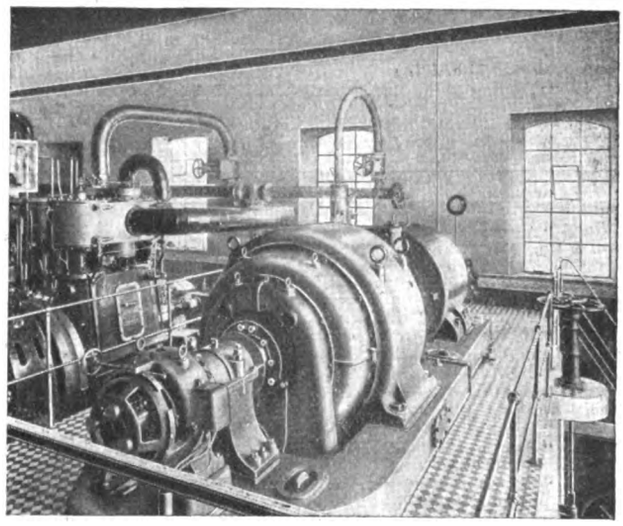

FIG. 3.—G.E.C. TURBINE-DRIVEN ALTERNATOR.

A New Squirrel-cage Rotor.

Referring to the description of their new rotor in our issue of May 14th, Messrs. Higgs Brothers write pointing out that they left the address there given some years ago; the correct address is Sand Pits and Summer Hill Street, Birmingham.

Electrically-driven Battleships.—The super-dreadnought *Maryland*, the fourth battleship of the U.S. Navy to be equipped for electrical driving, was launched at Newport News, Va., on March 20th last. This vessel is sister ship to the *Tennessee*, launched in April, and the *California*, launched in November, 1919, at the Mare Island Navy Yard, California, and to the *New Mexico* already in commission. All four ships are similar in size and equipment. The *Tennessee* was expected to be commissioned last month.

SCIENCE AND INDUSTRY.

Science states that Dr. Van H. Manning, Director of the U.S. Bureau of Mines, has resigned his post to take the position of Director of Research with the American Petroleum Institute, after 34 years' service. In his letter of resignation he points out that within the last few years it has been impossible for many men to remain in Government service; the competition of industry is taking the highly trained men of the scientific bureaus at salaries which the Government does not pay, or even approach.

Dr. Fred. G. Cottrell, Assistant Director, has been nominated by President Wilson to fill the vacancy; his process (based on the Lodge process) for precipitating fumes and dust is in world-wide use, but he assigned his patents to a non-dividend paying body, the Research Corporation, in order to encourage scientific research.

Prof. E. F. Nichols, of Yale University, has also resigned his post, to become the Director of Pure Science in the Nela Research Laboratory of the National Lamp Works of the General Electric Co., at Cleveland, U.S.A. He remarks that "the position offers complete freedom in the choice of research problems, and places at my unhampered disposal such human and material resources as no university I know of can at present afford. . . . The heightened opportunities of the new position are in everything else so advantageous, that the offer becomes finally irresistible."

Here is matter for earnest thought. Scientific experts are being welcomed with open arms—and purses—in the industrial world of the United States; the academic profession and the Government alike are unable to make it worth their while from any point of view to disregard the voice of the charmer. And be it noted that Prof. Nichols has a free hand to undertake *any* research in pure science that he thinks fit. This is very significant; it is not, however, surprising, for the General Electric Co., U.S.A., has proved beyond doubt that pure scientific research pays it handsomely. It would, on the other hand, be exceedingly surprising if any firm in this country adopted such a policy. We do not say this in a fault-finding spirit; we know only too well that circumstances in the past have not permitted of the adoption of so enlightened a policy. There is, however, a certain tendency to emphasise the importance of "industrial research" at the expense of "scientific research," a distinction of which we do not altogether approve; by the former is meant research which is obviously utilitarian, while by the latter is denoted research without an immediate utilitarian objective, research for the pure love of research, but obviously "research" which is not scientific is not worthy of the name.

Returning from this digression, we wish to point out that in this country also scientific men are leaving the employment of the Government and of teaching institutions for appointments in connection with industry. This is an excellent thing for industry at the moment; but it is a very serious matter for our scientific institutions in the present, and for industry in the near future. The teaching profession, always underpaid in this country in normal times, and now absolutely starved, is in danger of losing

Digitized by Google

its scientific staff, and the students, who were never nearly so numerous as now, are in danger of being left without competent instructors. What that means to industry is only too plain.

Here again we have to face new conditions, brought about by the Great War. Industry now recognises the value of scientific training—colleges and universities are in urgent need of funds to make good the fall in value of the currency, and to provide for larger numbers of students. The key to the whole situation is, as usual, a golden one. If the universities and colleges are to be in a position to supply the demands of industry for scientifically-trained men, industry must supply them with the means. It will be a profitable investment, and the need is so pressing that delay will involve the gravest consequences.

The All-Electric House.

In our last two issues we have published articles describing, on the one hand, experience obtained by the Glasgow Corporation electricity department in the use of electricity for all domestic purposes—lighting, heating, and cooking—in two houses, over a period of one year; and, on the other, a complete installation from the source of energy to the consuming apparatus in a large country house, which, together with the estate cottages and offices, has been equipped for "all-electric" operation. These articles are of exceptional interest at the present time, when the merits of electricity are being closely scrutinised and debated by unfriendly critics, and are about to be discussed at a special meeting of the Institution of Electrical Engineers.

Regarding the latter example, it is, of course, somewhat exceptional; not many estates have at command 150 H.P. But there are many places where 10 to 20 H.P. could be obtained, and this would be ample for most requirements, with the aid of a storage battery. What can be done in this direction was well shown in the article by Mr. Thomas Smith in our issue of August 30th, 1918, in which he gave some particulars of 273 water-power electric installations carried out in 10 years in Wales by a single firm, the power developed ranging from 2 to 27 H.P. Complete records are being kept of the operation of this all-electric equipment, and we hope that eventually they will be available for publication; we understand that they are extremely interesting.

The former instance, however, is of much wider application, and deserves close study. The author, Councillor Denny, states that conclusive confirmation has been obtained of the fact that the domestic load is better distributed throughout the day, and may become far more important, than the power load, while if combined with the existing load it would greatly improve the load factor.

The advantages gained by the consumer by the use of electricity for all purposes are too well known to our readers to call for recapitulation here; they are obtained at a total annual cost for energy of £32 to £35 per house, which could certainly be reduced, as the author points out, by one-third if the domestic load were developed, and would then involve no great increase over the cost of coal and gas. We were about to say "for equivalent service," but this would be wrong; coal and gas cannot by any possibility render service equivalent to that of electricity, but they can, and do, introduce an intolerable amount of dirt, dust, labour, and pollution of the atmosphere, all of which have to be paid for in terms of health and pocket. Could these items be accurately costed, we have no doubt at all that the actual inclusive cost of the electrical supply would come below that of its grimy rivals—or rather, competitors, not rivals.

As we have said before, paper calculations regarding thermal units, &c., are incapable of demonstrating the facts in the comparison; they deal with only one aspect of the subject, and they entirely fail to take account of factors which cannot be neglected, not least of which is the great saving of labour effected by electrical methods. Public opinion does take these factors into account, and there is no room for doubt as to its verdict.

"Situations Vacant."

Last week we commented on the defects of the customary practice in connection with the filling of appointments which have been advertised in our pages, and urged that unsuccessful applicants ought not to be left in the dark as to the result of their applications. We might have mentioned that some of our advertisers in such cases notify the fact that a post has been filled, and courteously convey their thanks to those who have answered the advertisement by means of an announcement under the heading "Appointments Filled"; but human nature being what it is, the thought that our attitude was not altogether disinterested might have suggested itself to the cynical reader—if any of our readers are cynical.

We have, however, found a solution to the problem which we hope will commend itself to both advertisers and applicants. Our advertisement department has arranged to insert, free of charge, notices stating that specified appointments have been filled. An announcement to this effect appears in our advertising pages to-day, and in the interests of applicants we trust that advertisers will make use of this method of closing correspondence, which will involve the minimum of effort and expense while, we believe, fully meeting the needs of the case.

An Imperial University?

The demand of the Imperial College of Science and Technology for university status and the power to confer degrees was further pressed at a public meeting in London on Friday last; the audience consisted mainly of students, and several eminent men gave addresses in support of the claim. The Imperial College is independent of the University of London, but is recognised as a school of the University, so that its students may take the "internal" degree. It is pointed out that the diplomas of the College, while of deservedly high repute, do not carry the same weight as a University degree, which is recognised as a "hall-mark," and has a commercial value.

It cannot be denied that there is room for more than one University in London; three or four universities would not be too many for a population of seven millions. But what is a university, and what is the meaning of a university degree? It is not now given to any man to study all branches of knowledge, and even in a university specialisation is inevitable, but at least a university must provide instruction in all those subjects which are embraced in a liberal education, and afford facilities for the absorption of that general culture which is the only sound foundation upon which to erect a superstructure of specialised knowledge. Essential elements of that culture are the study of mankind, and the polish which is imparted by constant association with one's fellows in the atmosphere inherent to a university, where all are equals and comrades.

In those functions of a university the Imperial College is unquestionably deficient, at present; it makes no claim to teach the "arts," or, rather, the "humanities," a term which has been falsely arrogated to classical studies, but which in truth denotes "the highest and most harmonious culture of all the human faculties and powers" (Trench, *On the Study of Words*). We are not finding fault with the College on this score; on the contrary, we have the highest admiration and respect for it as a truly Imperial College of Science and Technology, an institution worthy of its great calling as the scientific focus of the Empire. But it is not at present organised or equipped to fulfil the functions of a university: what guarantee have we that, if endowed with authority to confer degrees upon its alumni, the new university will develop itself into a university in fact as well as in name?

That is the sole consideration which deters us from supporting the claim of the Governing body, the staff, and the students. In the absence of that development, the College will remain a College, while it becomes a pseudo-university, its degrees will be technological diplomas in disguise, and its graduates will lack breadth of culture.

THE GLORY OF THE DAY'S WORK.

By "FEMINA."

IT is said that Walt Whitman, on seeing some labourers returning from their daily toil, exclaimed to his friends: "Ah, the glory of the day's work, whether with hand or brain!" Whatever may be thought of Walt Whitman's poetry, one cannot help feeling that it came from his heart; and as, according to an Arab proverb, he who speaks *from* the heart speaks *to* the heart, we may be sure that this utterance of his met with a ready response from all those who were working heart and soul, in any way whatever, to make America the great power in the world she is to-day. The greatest nation that this world will ever know will be the nation that feels in its inmost soul that the day's work, faithfully and conscientiously performed by every one of its people, man, woman and child, is indeed a glorious thing. This truth must be brought home to every worker, from the humblest drudge to the most gifted genius, before any nation can become in reality one of the Great Powers of the World.

The great masterpieces of the world are silent witnesses to the fact that this sense of glory existed in the past, and we have only to turn to the Old Testament to see that it was "as a burning fire" in the heart of the Jewish nation. I may quote as instances the making of the Tabernacle, the building of the Temple and the rebuilding of the Wall of Jerusalem. I suppose that in England to-day the majority of employers and workers would regard as idealistic nonsense the idea of there being any glory about the day's work—the idea of work for work's sake, for the sake of the prosperity of the industry, the prosperity of the country. They have become more accustomed to Mr. John Masefield's "ring o' roses" point of view: "Men work to get enough to eat, so that they may have strength to work to get enough to eat." Yet this glory has not really departed, any more than the sun departs from the heavens during a dense fog or a thunderstorm. It shone clear and undimmed during the war, although darkness has returned to the national soul since.

"There is no sentiment in business" we are told by both employers and employed, but then most popular catchwords are either fallacies or half-truths. We cannot afford to disregard the spiritual factor in industry or anything else, for it is the vital principle.

If this sense of glory once became general it would solve automatically many labour problems. The account in the Book of Nehemiah of the rebuilding of the Wall of Jerusalem is well worth studying by both employers and workers to-day, for it is a splendid story of a great engineering feat, a mighty effort made under great difficulty and in the face of the most strenuous opposition. We read that not only were the workers protected by armed guards, but the builders had their swords girded on at their sides and other workers had a tool in one hand and a weapon in the other. Yet the work of rebuilding the wall and restoring the many gates was finally brought to a most successful conclusion in record time. The secret of success is explained in one simple statement: "*the people had a mind to work.*" Moreover, there was a marvellous system of organisation and co-operation. The whole story makes one feel ashamed of the toluation in England s darkest hour of such treasonable tactics as the "ca' canny" policy, the limitation of output, and the exclusion from employment of the men who kept this country safe for those who stayed at home.

It is not now a question of rebuilding a city wall, but of reconstructing an entire continent—one might almost say a world. Yet where to-day shall we find men with the spirit of Nehemiah to say to those who would divert their attention from their colossal task: "I am doing a great work so that I cannot come down; why should the work cease whilst I leave it and come down to you?" And yet for want of such men reconstruction may share the fate of the Tower of Babel.

This is perhaps partly the fault of our system of education. For centuries we have been teaching our children that work is a curse—a punishment inflicted on the entire human race because of one man's sin; when we *should* have taught them that, like the other so-called curse—suffering—it is a means of salvation and redemption. As Emerson tells us: "A man's task is his life-preserver."

We also teach them to repeat glibly: "The whole is greater than its part," without showing them the spiritual meaning of this somewhat obvious statement, or its corollary—that the most infinitesimal part is essential to the completeness of the whole, or, as Kipling puts it, "The game is more than the player of the game, and the ship is more than the crew."

What we want is education for *Life*—not merely education for examinations. For this we must begin at the beginning—with the baby in the nursery school. Let us teach the child before his imagination is crushed out of him that there *is* a glory about his day's work, that it matters, and matters greatly, not only to the worker himself, but to his country and his God.

We must also get rid of the idea that there is only a glory about skilled or artistic work, and none about physical or mental drudgery. A man cannot become a skilled craftsman or an artist without serving a certain apprenticeship of drudgery. The world is learning slowly and painfully the lesson that each nation should perform its own drudgery, that it is a grave mistake to employ slave labour or foreign labour for this purpose. We are also gradually learning that it is a reproach rather than a distinction to belong to the "leisured classes." As the absolute necessity for increased production becomes more and more apparent, it is being brought home to all that, if England is to be saved from financial and national ruin, she can no longer afford to maintain idlers in her midst. Every man and every woman should have hours of work and hours of leisure. Alfred the Great was not so very far wrong when he divided the 24 hours' day into three parts—eights hours for work, eight hours for recreation, and eight hours for sleep; in other words, eight hours for useful work and 16 hours for recuperation. It is impossible to lay down general rules for the employment of leisure hours, as this depends on the kind of energy expended during the working hours; but part of the time should be devoted to the development of those faculties, talents, or powers that lie dormant during the performance of the daily round.

It has been said that labour leaders are the only politicians with vision and high ideals. But recent events and utterances seem to show that the vision is somewhat limited, and the ideals not so very high after all. The aims of Labour since the war have not reached any higher than the financial betterment of the working classes without regard to the prosperity of the industries to which they belong—the prosperity of their country so grievously afflicted by the Great War. They talk of "bringing the capitalist edifice crashing to the ground." Perhaps they do not remember the fate of Samson who brought a certain other edifice crashing to the ground. They are fond of saying that Capital is useless without Labour. May one be allowed to point out that Labour is also useless without brains to direct it and capital to finance it? In fact, Reconstruction in every direction is being hampered instead of helped by Labour. With regard to the housing difficulty the *Daily Telegraph* tells us:—

"The building trades are very much under-manned. Their numbers are less by 200,000 . . . . than they were before the war. Yet double that number of ex-Service men are unemployed at the present time, who would be very glad to join these and similar unions if admittance were not denied them. The whole country is crying out for houses . . . and yet, though tens of thousands of men are earnestly seeking work, they are shut out from the most obvious and most under-staffed field. The situation is aggravated by the decreased out-

Digitized by Google

put of the men actually at work, and thus a situation is created which is preposterous in the circumstances and utterly incapable of defence."

There seems only one way of ending the present lamentable deadlock, and that is to make all concerned in any way in any industry realise that "a house divided against itself cannot stand," that they are members one of another—fellow-workers each doing his part in a great work, and fellow countrymen each contributing to the prosperity of his country. As long as the antagonism between Capital and Labour lasts we cannot hope to draw any nearer to the promised New Earth. "Hatred will never cease by hatred."

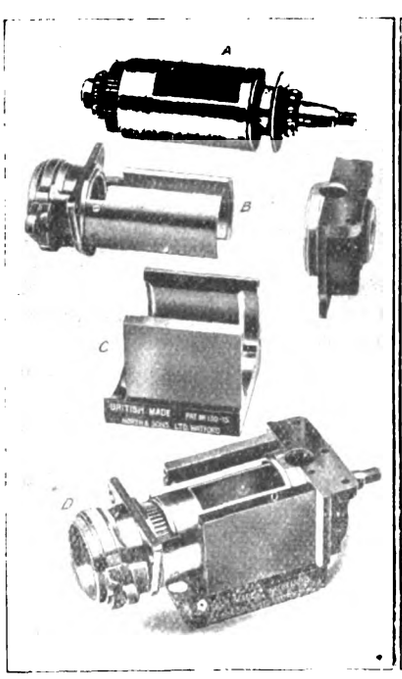
A just and at the same time practicable system of profit-sharing would, no doubt, do much to dispel the mists that at present obscure "the glory of the day's work." It has not yet been sufficiently recognised that profits are produced by the conjunction of money, brains and labour, and that any one of these factors is useless without the other two. But a greater incentive even than personal gain would be a change of heart, a change of attitude towards work, a re-kindling of that enthusiasm without which nothing great can be done.

A BRITISH MAGNETO WITH MANY DISTINCTIVE FEATURES.

By F. H. HUTTON.

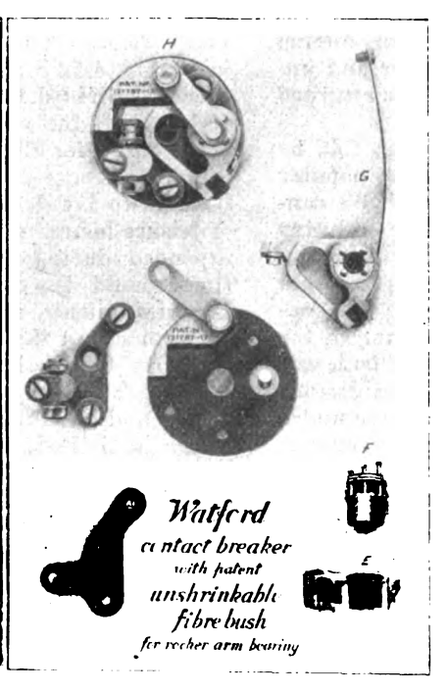
In these times it is pleasing to come across an industry which is in a thoroughly healthy state, producing machines of the very highest quality which embody many improvements over pre-war practice, and turning them out in satisfactory numbers to meet the enormous demand. A recent visit to the magneto works of Messrs. R. B. North & Sons, at Watford, showed all the foregoing remarks to be true in this instance. Being one of the firms who were up to the neck in magneto work all through the war, straining every nerve to produce machines for the arduous service then required, they can well claim that their present magnetos have come through an ordeal of fire in every sense.

A visit to these works is a real treat to anyone interested in fine engineering; the rows of beautiful little precision lathes, milling machines and grinders, the wonderful miniature automatics, &c., are an exhibition in themselves, while the foundry, a spot generally resembling a near approach to the lower regions, in this case is an apartment which might well be used as a dining hall! Such conditions, although they may not affect the design of the product, are generally to be found reflected in the class of workmanship turned out. Although a great deal might be said on this score, and on the extraordinary accuracy in the gauging of parts all through the works, it is time to proceed to details of the article manufactured—the new Watford magneto, of which the most noteworthy parts are shown in the illustrations. Briefly, the two main objects aimed at are to make the spark equally efficient throughout the whole timing range, and to improve the action of the contact-breaker by alterations in design. Dealing with the first point, we may remember that the worst fault of an ordinary magneto is that it produces its most effective spark only when the timing is set at one particular place. Since this place has to be arranged so that it suits normal running engine speeds (*i.e.*, high speeds) it follows that the correct positions for slow running and starting cannot be much used in practice. The reason is that a strong spark is only produced by the contact-breaker opening when the armature is in the most favourable position with regard to the magnets, in other words, when it is in the strongest magnetic field. These positions occur twice in a revolution, and are only momentary. The difference is made in the new Watford magneto by providing sliding pole-pieces or shoes for the magnet as shown in fig. 1, B and D. These extra pole-pieces, made of steel, are attached to the brass cam-ring, and project into the body of the magneto, fitting between the magnet itself and the armature. When the timing is altered by moving the cam-ring these extra pole-pieces move with it, the consequence being that when the contact-points open the magnetic conditions are always at their best. That is, whether the spark is timed early or late within the range provided, the spark is equal to that from an ordinary magneto at its maximum position. The idea of this improvement is admittedly not a new one, but in order to carry it out successfully the very highest class of workmanship is necessary, and to maintain this degree of accurate workmanship under the stress of ordinary commercial production is no easy task. This is the problem that Messrs. North & Sons claim to have solved. It will be realised that the sliding poles must be manufactured to the finest limits, and must maintain their position accurately under ordinary working conditions. In order to ensure this a small recess is cut in the end of the pole-shoes which engages with a spigot on the driving end-plate of the magneto, thus forming a guide and materially helping to keep the pole-shoes in place. The other parts illustrated in fig. 1 are the armature complete, the driving end-plate and the fixed pole-pieces.



A, Armature complete; B, Sliding pole shoes attached to cam ring; C, Magneto poles; D, Armature, magnet poles and sliding pole shoes assembled.

Fig. 1.—Magneto Parts.



E, Rocker (cut away to show bush housing); F, Unshrinkable fibre bush; G, Rocker with spring attached; H, Contact breaker assembled.

Fig. 2.—Contact Breaker.

The new contact-breaker, shown in fig. 2, is full of interesting features. The moving "arm" in this case consists of a triangular structure, very strong, but very light, being milled out of the solid with the greatest accuracy. The balance of this "arm" has been carefully studied with regard to neutralising the effects of centrifugal force at high speeds. An outstanding feature is the design of the fibre bush. Messrs. North & Sons are convinced that fibre is still the best material for this purpose, in spite of the alternatives which are available. They have therefore set about devising a bush made of this well-tried material which shall absolutely avoid the old trouble of swelling, and so causing the arm to bind. The result of their researches is seen in the illustrations E, F, and G, fig. 2. It will be noticed that the bush is larger than usual, that fine slits are made in certain places, and that a special

Digitized by Google

manner of fixing is employed. It is claimed that this bush has been tried to the utmost under the worst possible conditions, and that it is absolutely proof against swelling. A buffer is provided over the moving arm to restrain the flinging action at high speeds. Other details of this interesting contact-breaker are shown in the illustration, the complete view being at the top. This design of contact-breaker, being a further improvement on the pattern used so successfully on Watford magnetos in air service during the war, is well worth attention.

LEAVES FROM AN INSPECTOR'S NOTEBOOK

By "ANODE."

One of the most interesting things in an insurance inspector's life is the examination of breakdowns. To say nothing of the uncertainty of these, it is distinctly exhilarating after a hard day's work, probably underground, to arrive at home and find a wire awaiting you, informing you of a breakdown, probably not two miles from the place you have been at all day.

I remember on one occasion receiving a wire asking me to proceed to a town some hundred odd miles away, after a journey in the corridor of a train for three hours. I left home next morning in no very amiable spirit, and on arriving at the scene of the catastrophe I found it was nothing more than a break in the shunt windings of a 2-h.p. motor. As the break was between the field coils, it was remedied in a few minutes, and naturally it did not improve my peace of mind; still it might have been worse, and for small mercies we must be thankful. Not all breakdowns, however, are so simple. Once I was out making an inspection of a large plant some distance from a station and had to hire a conveyance, and could only hire the car for the day. I did the inspection, and decided to visit a colliery some miles away, and make a part inspection at any rate. The electrician was a personal friend, both of us having worked in the same shop, so the visit was likely to be a pleasant one. On inquiring at the power house for my friend, I was informed that he was underground, and had been there for the past 24 hours, having had trouble with a 250-h.p. motor, which was insured. Now this was very awkward, as spats and light boots are not exactly healthy underground; and this colliery prided itself on its own particular and exclusive brand of slush underneath. If I had my way I would make it a criminal offence to have any colliery underground; they all ought to be on the surface, and near an important station. But we cannot always get what we want, so I had to make the best of it. I then had an idea that probably the trouble was with the pump, and not the motor, in which case my worthy colleague, the mechanical inspector, would have the jubilee. I got hold of the electrician on the 'phone and asked for the news, devoutly hoping that it was the pump. This reminds me of the occasion when I visited a friend in a hospital early one morning. He was in a bad way, and no hope could be entertained of his recovery. The nurse hoped that he would last out till 8 o'clock, and she seemed quite concerned about it. On my inquiring why she was so anxious, she calmly told me that if he died before eight she would have to lay out the remains, but if he lasted till after eight, the day nurses would have the job. I felt something like the nurse, thinking of my beautiful spats. But my luck at this part of the proceedings was dead out; it was the motor, so I reluctantly descended, and ruined my pretty spats.

On entering the chamber of horrors I was told that the trouble was overheating of the rotor, and that everything possible and impossible had been done, even to the extent of fitting new bearings and altering the taps on the starter. Now I knew this particular breed of machine. I looked very carefully at the junction of the rotor bars and short-circuiting ring, and found that the joints were black; this proved to be the trouble—resistance in the rotor circuit. My friend was not by any means pleased at the diagnosis, especially at the difference between his 24 hours and my 24 minutes.

It is surprising what a little thing will cause trouble in a motor. I well remember on one occasion being asked to look at a small motor which was sparking badly. It was an old type of machine, and had run for seven years without any trouble till then, when it started eating a set of brushes up in a week or so. I tried altering the brush position, but without effect; tested the armature thoroughly, everything correct; when I noticed that there were no flexibles on the brushes. The attendant, a new man, told me that he did not see the use of them, so he cut them off. On fitting a new set with leads on, the trouble ceased. Sometimes it is very easy to be too particular, and on one occasion I got badly let down, and my company let in for £20. At a large restaurant there was a small single-phase motor used for driving an ice-cream freezer, and the starting device was the usual phase splitter, the handle of which was missing. I pointed this out on my reports for some considerable time, until I decided that it was time my recommendation was carried into effect, so I interviewed the proprietor, and pointed out the danger of the attendant putting his fingers inside the starter to get hold of the cross bar, mentioning that 210 volts at a frequency of 93 was not healthy, and that if he had a weak heart, or status lymphaticus, there would be a coroner's inquest, and he would not come off lightly. That "status lymphaticus" fetched him, and he promised that the necessary would be done instantly, immediately, forthwith, and personally. This was on a Thursday, and on the following Monday I received a wire asking me to attend at a breakdown at this establishment. On arrival I found the motor burnt to rags and cinders. The machine was left O.K. on the Saturday night, and it was found burnt out on the Monday morning, when they opened the premises. All that I could find was that the starter was discovered to be in the running position, but the attendant was positive that he left it in the off position. In addition to having to report the details of the breakdown, I had to give the cause of it, which was not easy in this particular instance. While I was thinking it over, a cat jumped up to a window, via the starter, and in doing so it fouled the new handle, and pushed it into the running position.

Q. E. D.

SINGLE-PHASE METERS ON BALANCED THREE-PHASE, THREE-WIRE SYSTEMS.

By H. G. SOLOMON.

The use of one single-phase meter to register the consumption in a three-phase, three-wire network is still largely prevalent when the system is regarded as balanced. The method is, however, almost invariably wrong, and in many instances leads to totally incorrect results, even though the load actually constitutes a balanced load in itself. It should be entirely discarded, as it is not difficult to prove that a single-phase meter will only correctly indicate the three-phase consumption on the fulfilment of two conditions—perfect balance and unity power factor—which never obtain together in practice. These two conditions must go hand-in-hand, as however well-balanced the system may be, if a power factor less than unity be present, considerable inaccuracy dependent upon the magnitude of the power factor will ensue, apart from the characteristic errors of the meter itself.

The only proper method of measuring the consumption is the employment either of two single-phase meters on the well-known two-wattmeter connection, as indicated in the accompanying diagram, or of a three-phase, three-wire meter. The latter is simply a combination of two single-phase meter elements to form a single instrument, with one counter which registers the total consumption, and is connected in exactly the same manner as when two separate single-phase meters are employed. In the

Digitized by Google

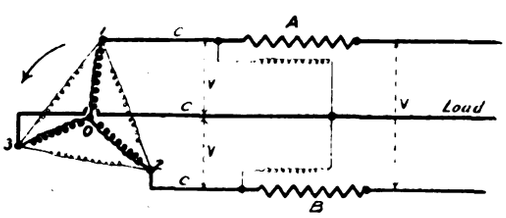
latter case the consumption is the algebraic sum of the two meter readings.

Referring to the diagram, if the phase voltages pass through their maxima in the sequence of 1, 2, and 3, then meter A will be in the leading phase, and meter B will be in the lagging phase. Since the system is supposed to be balanced, the voltages between any two of the mains will be equal to one another, and the currents in the mains will be the same. Representing the voltage and the current by V and C, as given by a voltmeter and ammeter respectively, and denoting the power factor by cos ϕ, then the mean power is—

$$P = V C \cos(\phi - 30^\circ) + V C \cos(\phi + 30^\circ) = \sqrt{3}\, V C \cos\phi.$$

Regarding the power as remaining constant over a given interval of, say, one hour, then the energy consumption in watt-hours will be represented by the same equation. The one meter A in the leading phase will read $V C \cos(\phi - 30^\circ)$, the other meter B in the lagging phase will indicate $V C \cos(\phi + 30^\circ)$, and the total consumption will be their sum, namely, $\sqrt{3}\, V C \cos\phi$.

A. Unity Power Factor.—When there is no displacement between the phase voltages and the currents, *i.e.*, when the power factor is unity, cos $\phi = 1$ and $\phi = 0$. A will thus give $V C \cos 30^\circ$, *i.e.*, $\frac{1}{2}\sqrt{3}\, V C$, B will indicate the same amount, and their sum is $\sqrt{3}\, V C$, the total consumption. It will be observed that in this case each meter, independently of whether it is in a leading or lagging phase, will register one-half of the total energy. Consequently, if one be employed, say A, connected in any one of the three-phase mains as a two-wire meter, and its dial reading be multiplied by 2, it will correctly give the total three-phase energy, but in this case only. When a single-phase meter is used in this manner, the dial reading, in general, gives



Connections of Meters.

the total amount directly, without the use of the multiplier 2, as this is taken into account in the gearing between the integrating train and the rotor spindle.

B. Power Factor less than Unity.—In this case the total energy is still $\sqrt{3}\, V C \cos\phi$, and the two meters read as before $V C \cos(\phi - 30^\circ)$ and $V C \cos(\phi + 30^\circ)$.

Suppose the load consists of a three-phase motor running at full load with a power factor of 86·6 per cent. for the given interval of one hour. Then cos ϕ = 86·6 per cent., and $\phi = 30^\circ$. The three-phase energy absorbed by the motor is $\sqrt{3}\, V C \cos 30^\circ$. Meter A shows $V C \cos(30^\circ - 30^\circ) = V C$; meter B indicates $V C \cos 60^\circ = \frac{1}{2} V C$. Their sum equals 3 VC/2 which is $\sqrt{3}\, V C \sqrt{3}/2 = \sqrt{3}\, V C \cos 30^\circ$, the total energy.

Although the load is a really balanced one, meter B, it will be seen, registers $33\frac{1}{3}$ per cent., and meter A $66\frac{2}{3}$ per cent. of the total consumption, which is simply their sum. There is, of course, nothing astonishing about this. It is merely a reiteration in different terms of the preceding statement, and is made in this way to emphasise the fact, which does not appear always to be fully realised, that, despite the balance of the system, when a power factor less than unity exists it is quite impossible from the three-phase principle for the meter readings to be equal. Their inequality does not point to a want of balance, but to an inductive load. If, therefore, the single-phase meter for three-phase balanced loads be used, for example, in the leading phase, such as A, it will read $2 \times V C \cos(\phi - 30^\circ)$, and since $\phi = 30^\circ$, its indication will be $2 \times V C$. The true amount is $\sqrt{3}\, V C \cos 30^\circ$, which is the same as $\frac{3}{2} V C$. Hence the single-phase meter when in the leading phase will be *over-registering* by $33\frac{1}{3}$ per cent. of the true amount. If connected, on the other hand, in the lagging phase as B, it can be shown in a similar manner that it will be *under-registering* to the same extent.

Next, suppose that the motor is running light, when its power factor may be of the order of 50 per cent., *i.e.*, cos ϕ = ·5, which means that $\phi = 60^\circ$. The true load is $\sqrt{3}\, V C \cos\phi$, or $\frac{1}{2}\sqrt{3}\, V C$ (C is now different in value from the full-load current). Meter A correctly gives $V C \cos(60^\circ - 30^\circ) = V C \sqrt{3}/2$, which is the total energy, and meter B gives no reading at all, as it has stopped ($V C \cos(60^\circ + 30^\circ) = 0$). Hence the single-phase meter for three-phase balanced loads in the leading phase will give $2 \times V C \cos 30^\circ$, *i.e.*, $\sqrt{3}\, V C$, which is twice the true total energy, and will thus indicate 100 per cent. high. Of course, in the lagging phase the meter will stop and not give any reading, whereas the actual total consumption is still $\frac{1}{2}\sqrt{3}\, V C$.

Even with so high a power factor as 97 per cent., which is rarely exceeded with purely lighting loads, the errors are not so negligible as they are commonly supposed to be. With this power factor the corresponding angle of lag is 14°, the true total energy is 1·68 VC, whereas, as is easily shown in the same way as in the other examples, the one single-phase meter for polyphase loads will have an error of + or − 14·3 per cent. of the total amount according as it is in a leading or lagging phase.

THE PROGRESS OF THE SPANISH ELECTRICAL INDUSTRY IN 1919-20.

In reviewing the progress of the Spanish electrical industry in 1919-20, the *Energia Electrica* places in the forefront the "transformation into Spanish of a great German electric undertaking," as it terms it, namely the Deutsch-Ueberseeische Elektricitäts Gesellschaft, under the style of the Sociedad Transatlántica Alemana de Electricidad. The transformation is due, it appears, to the exertions of the late Minister of Patronage, Don Francisco Cambó, to whom are owing other important financial and industrial innovations. The present financial situation in Germany and the enormous depreciation of the mark have forced the German company, in order to obtain capital for extensions and acquisitions of raw materials, to consider either a sale of the assets or the transformation of the company. The English and the Americans, according to the Spanish paper, contended together in offers for the many light and power concessions of the German company in the numerous cities of South America, but the outcome arrived at is owing to the exertions of Señor Cambó, and "the sympathy shown for Germany by Spain during the war." The headquarters of the new company will be in Madrid and its technical offices in Barcelona. Its capital will be 300,000,000 pesetas, a portion of which will be taken up by a Spanish group of bankers.

Besides the important event above chronicled, other noteworthy occurrences show plainly that, far from interruption of the rapid unfolding of the Spanish industry initiated some twelve years ago, that industry has continued to develop with ever-increasing speed. Passing by the 200,000,000 pesetas invested in electric installations now completed, new companies with strong capitals have been formed in the past year, to carry out already planned schemes which, it is to be hoped, will rapidly pass into the state of tangible realisation.

The Sociedad Electrica de Lima, which during 1919 raised its capital from 4,000,000 to 10,000,000 pesetas, has finished the erection of machinery for the first hydroelectric group of 8,750 KW., and has founded an offshoot, the Union Electrica Portuguesa, which, like the company of the same name in Madrid, is engaged in distributing current in Oporto, Braga, and other localities in the neighbouring country, the current being drawn from the falls of Lindoso, 12 kilometres from the frontier; it has both carried out the erection of the transmission lines to Oporto (80 km.) and completed the transformer station in that city. A Portuguese group subscribed 50 per cent. of the capital of the Union Electrica Portuguesa, the balance being put up by Spanish offshoots of the Hidro-electrica Iberica y Española, owning the Lima falls whose capacity is 20,000 H.P.

The Sociedad Hidroelectrica Iberica is continuing its works at the Cinca falls (Huesca), and to obtain further resources and to develop the Cinqueta falls (47,000 KW. from the two falls), besides the 20,000,000 pesetas of bonds raised in 1918, decided last month to increase its capital by 20,000,000 pesetas, bringing its total capital up to 60,000,000 pesetas.

The Hidroelectrica Española, prosecuting its development of the Dos Aguas falls, for which it has ordered two 23,000-H.P. Escher Wyss turbines, hopes by the end of the year to have working 20,000 H.P. of the 100,000 available.

The Sociedad Productora de Fuerzas Mortices issued in 1919 4,000 500-pesetas bonds in order to install a third electrogene

Digitized by Google

group at its falls, already completed, of 20,000 H.P. capacity on the river Flamisell (Lerida); the greater part of its output (16,000 H.P.) is supplied to the Energia Electrica de Cataluña. This important company, whose capital is over 100,000,000 pesetas, finished in 1919 the installation at its Molino falls on the River Flamisell, its 20,000 H.P., with 40,000 H.P. from the Capdella station on the Flamisell, being supplied to Barcelona, Sabadell, Manresa, Granollers, Cornella, Badalona, Gerona, Palamos, Palafrugell and other localities in Cataluña.

The Cataluña de Gas y Electricidad, which is the oldest company supplying energy to Barcelona (having been constituted in 1843) and has a capital of 60,000,000 pesetas, continued its works at the falls of Puente Argone, on the River Esera, in 1919, where it has just started a Piccard-Pictet-Oerlikon 5,000-H.P. hydroelectric group. As this company harnessed in 1918 the Run fall, of 36,000 H.P., in three 12,000-H.P. units (the hydraulic installations and central being planned for four units, which with two groups of exciters, total 50,000 H.P. at the shafts of the turbines), it has disposable this year 41,000 H.P., which is absorbed by Barcelona and its industrial belt.

The huge Sociedad Fuerzas y Riegos del Ebro, which already disposes of 100,000 hydroelectric horse-power, has continued to prosecute its operations at the Camarasa fall at Noguera Pallaresa, without, however, installing the two groups yielding 36,000 H.P., which it expects to obtain from this installation. Similarly it has continued its operations at Electra del Viesgo on the Torina, capable of producing 10,000 to 12,000 H.P., and at the Camarmena fall (12,000 H.P.) on the river Cases, for which the machinery was ordered some months since in Switzerland. The Sindicato de Saltos de Agua del Cantabrico has continued its hydraulic operations at the group of three falls at Saja (15,000 H.P.) and bought the turbines for the equipment of an auxiliary fall of 200 H.P. to assist the works.

The Hidroelectrica de Navarra has inaugurated its works, built in the Laguna del Duque, where 1,000 H.P. is obtained from a 215-metre fall, supplying 60,000 volts to Salamanca and Penaranda; this power is capable of being raised to 6,000 H.P. by means of works already projected on the Laguna and at Trampal.

The Energia e Industrias Aragonesas Company, with a capital of 10,000,000 pesetas (formerly the Compañia Catalana de Productos Quimicos), began this year the building of a station at Biescas, and proposes to develop six falls, estimated to yield 50,000 H.P., at localities on the rivers Gallego and Ara.

The greater consumption of energy which has become noticeable in all centres of population and industry of any importance has forced electric undertakings to increase their means of hydroelectric production. Among those which have carried out works with this object may be cited the Union Electrica Madrileña, which formed last January the Electrica de Castilla, with a capital of 7,500,000 pesetas, which concern has begun works at El Jucar falls to yield 15,000 H.P., whose plant will be linked up, by a 100,000-volt transmission line, to the Falls of Bolarque which supply Madrid.

The Hidraulica del Cantabrico, 15,000,000 pesetas capital, has likewise undertaken construction, at its second fall, in order to increase to 12,000 H.P. the 6,000 H.P. now obtained at Gijon and Oviedo, at the same time acquiring the Candas fall, lines, power station, and distribution network of the Electra Asturiana.

The Sociedad Anonima Mengemor, which obtains 6,300 H.P. from its five falls on the rivers Ohanes, Quadelimar and Guadalquivir, issued in January last bonds for 7,500,000 pesetas to continue the works at its El Carpio fall, to yield 7,000 H.P., which will be absorbed in the provinces of Cordoba and Jaen.

The Compania Sevillana de Electricidad is developing the fall of Las Buitreras, affording 5,000 H.P. at Cortes de la Frontera (Malaga) to supply the Andalusian capital.

The Sociedad Electricas Reunidas de Saragoza has begun the operations of development of a 6,000-H.P. fall on the Gallego river.

Lastly, the Electro Industrial Coruñesa, owner of the Capela fall on the River Eume, is increasing its hydroelectric installations in presence of the growing calls of its clients in La Coruna and El Ferrol, where the lack of electric current, as also in Vigo, is principally owing to the great impulse given to maritime constructions. More than the 11,000 H.P. to be supplied by the works on the River Tambre now under construction will certainly be required by the Electra Popular de Vigo y Redondela to meet the demands of its customers.

Among the various concessions of water rights are worthy of mention (apart from the 300,000-H.P. scheme of the Sociedad Hispanoportuguesa) that recently secured by the Electra de Viesgo, of 55,000 H.P. on the River Sil. Its objective is mainly the development of mining operations in these regions. For this purpose it has further acquired the assets of the Energia Electrica de Asturias, with its Casomera fall yielding 2,000 H.P., and intends to acquire others.

Passing to electric traction, it may be mentioned that last year was opened to the public the first section (four kilometres) of the north to south line of the Madrid Metropolitan; following which are those of Barcelona and Bilbao, already under construction. There has been inaugurated the last section (Rubi to Tarrasa—9,242 metres) of the Barcelona to Tarrasa railway, which makes a total of 29.6 kilometres. Electricity has replaced animal traction on the Irun to Fuenterrabia tramway. Service has begun on the Vigo to Porrino tramway, the first section of the Vigo to Mondariz line, and a junction has been made at Pinos Puente with the Granada suburban system, owned by the Tranvias Electricos de Granada, which has an extent of 45 kilometres.

What has been said above justifies fully the statement, says the *Energia Electrica*, that the past year has seen a remarkable spurt in the Spanish electrical industry, the most noticeable feature of which has been the absorption of large capitals and the amalgamation of companies. No one can doubt that power is produced much more economically from the large hydraulic works than from the medium-sized or the small, hence these enlargements are more advantageous for the industry and the country.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

A New Earthing Clip.

An ingenious and effective earthing clip has been brought out by the METALLIC ELECTRICAL ENGINEERING CO., LTD., of 153, Corporation Street, Birmingham. It is shown in the figure, which explains itself. The clip is made of brass, and

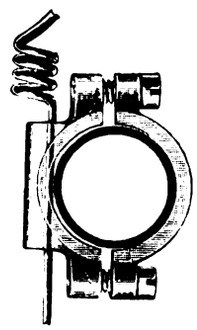


FIG. 1.—"METALLIC" EARTHING CLIP.

a sample before us shows that there is plenty of metal in it. No soldering is necessary, and the earth lead is firmly held. Five sizes are made, to fit tubes from ⅜ to 1 in.

A New Switch.

An ingenious tele-switch intended to replace the ordinary two-way switch, and to enable lamps to be controlled by means of pushes and bell wire, has been introduced by Messrs. J. CALVETTE, LTD., 11, Little St. Andrew Street, St. Martin's Lane, London, W.C.2. The switch itself is shown in fig. 2, and a diagram of connections indicating the general principle in fig. 3. It will be perceived that the tele-switch which controls the lamp or lamps is composed of a vertical electro-

FIG. 2.—CALVETTE TELE-SWITCH.

magnet with the poles extended horizontally, with a movable armature A pivoted to the lower pole. The electro-magnet is energised by means of a single dry cell, and the circuit is completed by push buttons, which can be fixed in any number of positions. If, for instance, the armature of the tele-switch

Digitized by Google

is in the left-hand position as shown in fig. 2, and one of the buttons is pressed, the armature will take up the vertical position between the poles, and the small catch to be seen near the top of the armature will fit into the slot just beneath it, but when the push button is released, the armature falls to the right and closes the spring contacts seen in fig. 2, causing the lamp to be switched on. On again pressing the same button, or one of the other buttons, the armature is again acted upon by the electro-magnet and moved into line with the poles, thus opening the contacts, and when the press button is released, the armature falls to the left. Thus lamps can be controlled at any point where the press buttons are fixed, and bell wiring can be used instead of the more expensive electric light wiring enclosed in tubing or casing. Any number of pushes can, of course, be used, and the tele-switch can control a number of lamps, a fan, motor, or any other electrically operated apparatus, the only variation in the design necessary being that when heavy currents have to be dealt with mercury contacts B are used instead of the spring contacts illustrated. With a separate tele-switch connected in each pole of the main supply circuit it is possible to extinguish the whole of the lamps in a building simply by pressing a button. For hotel lighting this tele-switch is particularly useful, for pushes can be fixed outside doors in passages, in rooms, or pear-shaped pushes can be suspended near beds. All the lamps on staircases can be controlled by a push button at the street door, and if desired by similar pushes on each landing. There are many possible applications of the switch. When it is used in conjunction with a clock movement and battery circuit, electric signs can be controlled in various ways, and the switch can also be employed with advantage for controlling stage lighting. The tele-switch can, of course, readily be applied to existing installations. There is nothing that is liable to get out of order, and as low voltage bell wiring is used for the control circuits, the erection of the wiring is greatly facilitated and extreme neatness easily secured.

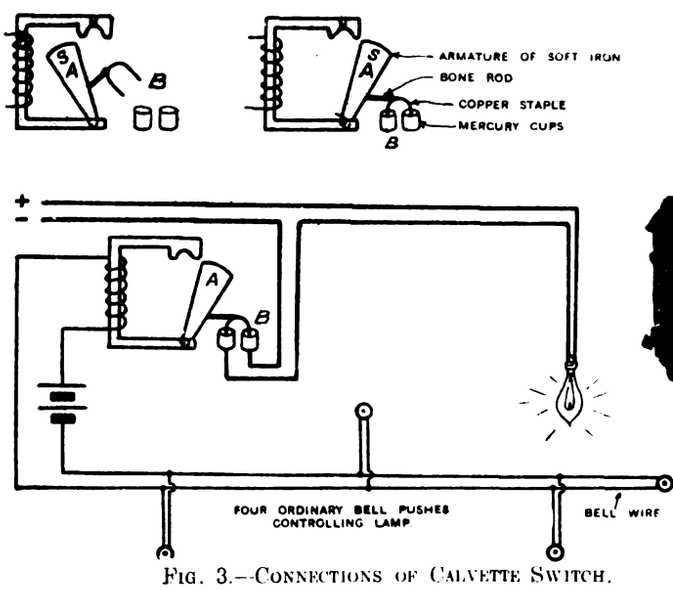

FIG. 3.—CONNECTIONS OF CALVETTE SWITCH.

Melbourne Railway Signalling Gear.

A new form of switchgear, specially designed for signalling circuits, is shown in the accompanying illustrations, figs. 4 and 5. This, in itself, is a complete small power-station switchboard, consisting of two generator and two outgoing feeder panels. The switches are for 30 amperes, 2,000 volts. The busbars also are completely enclosed, and are run in solid with compound. For synchronising purposes potential transformers are required with each panel, and these, as shown in the figures, are carried at the back of the busbars, where they are plugged in a similar way to the switches. Fig. 4 shows one potential transformer in position with the tank on, and another with the carriage drawn out and the tank lowered. It is claimed that the interlocking features of this gear are very perfect. It is impossible, without interference with the mechanism, to lower the tanks to get access to the conductors until the switches are drawn out and therefore safe to handle. Moreover, the switch or potential transformer may not be plugged in until the tank is reinstated in its correct position, thus ensuring great safety to the operators. The diagram, fig. 6, shows the connections of two panels, which form part of one of three inter-connecting boards. The apparatus was made by MESSRS. A. REYROLLE & CO., LTD., of Hebburn-on-Tyne.

G.E.C. Oil-break Switch.

Among the appliances illustrated in a recently published catalogue listing high tension switchgear manufactured by the GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, E.C.4, is an oil-break switch with an ammeter attachment for mounting on a wall. This switch is suitable for three-phase circuits, and is fitted with two overload releases and time lags. The maximum current the apparatus will carry is 60 amps., and the overload trip coils can be wound for normal currents of 10, 30, and 60 amps. Fig. 7 shows the complete switch and attachment, and fig. 8 illustrates details, the tank and cover being removed.

LEGAL.

British Thomson-Houston Co. and Duram Litigation.

In the Chancery Division on Friday Mr. Justice Astbury heard a summons taken out by the plaintiffs in this action. Plaintiffs in their action allege infringement of their patent for the manufacture of tungsten filaments for electric lamps. The validity of the patent is denied by the defendants, and the infringement is put in issue. The summons of the plaintiffs was that they might be at liberty by their general managers, solicitors, and scientific witnesses to enter the premises and works of the defendants at Hanwell and to inspect work, and examine the process used by the defendants for the manufacture of their drawn tungsten wire. Defendants opposed inspection, and set up a secret process.

Sir A. Colefax, K.C., Mr. J. Hunter Gray, K.C., and Mr. Trevor Watson appeared for the plaintiffs; and Mr. T. Terrell, K.C., Mr. Kerby, K.C., and Mr. Courtney Terrell for the defendants.

His Lordship, in deciding the question raised by the summons, said the circumstances under which inspection ought to be ordered in this case and the safeguards which ought to be imposed required to be most carefully considered. Defendants set up a secret process, and it was obvious that there was a difficulty where a secret process was set up in infringement actions of this character to devise a course which would do real and substantial justice to both parties without doing a grave injustice to either. He was not prepared to accept entirely the view expressed in the expert evidence submitted. The specification of plaintiffs' patent was a long and intricate one, and apparently was for an improvement in certain earlier processes in patents of 1906 and 1907, and there were five claims. He had suggested that before deciding whether inspection was or was not necessary the defendants should answer candidly and plainly a series of interrogatories to be delivered by the plaintiffs, with the object of asking defendants as to each step which in their judgment was indicated and protected by their own letters patent. This defendants had offered to accept, and they had also offered to give a full admission that they produced their tungsten rods under heat, and that the rod was drawn down by successive stages to the finest wire. Plaintiffs were desirous, however, of having an inspection at once, but having regard to the defendants' expressed willingness to answer questions which the plaintiffs would be permitted to frame as they were advised, he proposed to allow the summons to stand over until after he had seen the answers which the defendants were willing to make to the plaintiffs' questions.

CORRESPONDENCE.

Letters received by us after 5 P.M. on Tuesday cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Wiring Small Houses.

In the Electrical Review of May 7th there is an interesting letter from Mr. Inch on the wiring of small houses, dealing with the American method, in which no tees or elbows are used, the tubing being looped from point to point.

It would be very interesting if Mr. Inch would give further details of this method of wiring, particularly as many small houses are now being wired.

Installation.

June 1st, 1920.

"Situations Vacant."

I have just one little quota to add to the testimony of those who decry the use of box numbers by advertisers of vacant situations.

Recently I applied for a vacancy advertised under a Box No. in your journal. Being one of the very humble fry in this most excellent of all professions (or callings), I am in the habit of receiving many dismal reminders of my insignificance; especially subject am I and are mine to the snubs of those who by fortunate circumstance have climbed from among us. But there was one thing we would not stand, and that was a starvation wage, so we became members of a trade union, and thereby increased our remuneration doublefold, as well as established a fixed schedule of wages for our class of employment.

There are many economically minded chiefs who have very narrow views of what is adequate remuneration for their staffs, and who do not scorn the use of any method which will allow them to escape their obligations.

In reply to my application, I received a request to attend for an interview. This I did. At the interview I was offered a wage about 17s. 6d. per week less than the standard schedule rate, under the specious plea that the appointment was probationary—probationary for an undefined period.

I submit that the Box No. was used as a deliberate cloak to hide the identity of the advertiser in order that this individual might perpetrate his meanness undiscovered. To suggest a probationary period at less than standard wages to skilled, trained men of over 20 years' experience, is something which would not be done by the engineer and manager of a London municipal undertaking in an open public advertisement.

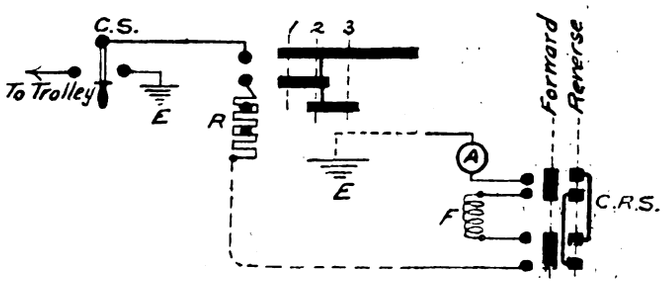
F. N. K.

June 7th, 1920.

Emergency Braking.

In your issue of the 21st May Mr. C. E. Slack asks if anyone can suggest a simple method of using regenerative control for emergency braking, with one motor defective and cut out of circuit. I cannot think of any means to this end without some addition to the wiring, and herewith offer the simplest method which has occurred to me. Either a two-way canopy switch or an additional one-way switch would be required; if the latter, it would preferably be interlocked with the canopy switch, so that both cannot be closed together.

The following sketch will probably explain my idea:—



C.S. = Canopy switch. A. = Armature.
R. = Grid resistance. F. = Series field.
C.R.S. = Controller reversing switch.

To obtain braking effect:—

1. Throw C.S. across to other contact. "Notching" arm of controller, of course, must be at "zero" position.
2. Pull reversing handle back.
3. Move "notching" arm carefully up on the *series* notches; the last notch will not be reached, as some resistance will always be required in circuit, at least until the speed has dropped to a low value.

I have not shown all of the main drum of the controller, but instead have dotted the leads to denote that other switches and apparatus lie between the canopy switch and the reverser, and also between the armature and ground.

As no alterations are required on the controller wiring or contacts, &c., this will not confuse anybody.

W. G. Stuart.

Trethomas, *May 26th*, 1920.

An A.E.G. Turbo-Alternator.

May I be allowed the hospitality of your columns to bring to the notice of those interested in the electricity industry the proposal of the electrical engineer for the Newport (Mon.) Corporation Electricity Department to place the order for repair to, and a new rotor for, the A.E.G. turbo-alternator installed at the power station with the A.E.G. of Berlin?

It would be interesting to know if our own manufacturers have been asked to quote for this work.

It may be that there are special features connected with this machine which make it essential to have the "Jerrys" on the job.

If such be the case, the quicker this machine is put out of commission the better, and replaced with one of British manufacture, made and capable of being repaired, if necessary, by British labour.

British.

The London Hospital.

Probably many of your readers have seen my recent letter in the *Times*. The London Hospital—the biggest in England and in London's most crowded corner—is on the rocks.

A few days ago we could not pay our week's bills, and we are still faced with the tragedy of closing.

The week's bills require £4,000, and I am thankful to say I have received two cheques for that amount from two gentlemen in the City—who prefer to remain unknown—each undertaking the upkeep for one week.

This way seems to lie salvation.

May I appeal to anyone whose business is flourishing to keep the whole hospital for a week? Failing that for a day or an hour—not a difficult calculation!

Knutsford,
Chairman.

Whitechapel.
June 5th, 1920.

ELECTROLYTIC CAUSTIC SODA-CHLORINE CELLS.*

The principle of the electrolysis of brine for the production of caustic soda and chlorine is exceedingly simple. On the passage of a current of electricity through a solution of common salt chlorine gas is evolved at the anode, or remains dissolved in the liquid surrounding it, while at the cathode hydrogen is liberated and caustic soda is formed. Owing, however, to the secondary reactions which ensue the primary products of electrolysis are not available in a simple cell to the extent theoretically possible. In consequence numerous modifications have been introduced with the object of eliminating or controlling these secondary reactions.

If it were possible to remove the chlorine, caustic soda, and hydrogen as rapidly as they were formed, no current would be used in the secondary reactions, and the ampere-hour efficiency would be 100 per cent. In other words, each ampere-hour would yield 1.3220 gm. of chlorine, 1.4910 gm. of caustic soda, and 0.03759 gm. of hydrogen. In actual practice the ampere-hour efficiency ranges from 90 to 98 per cent.

The energy efficiency depends upon both the current and the voltage of the cell. The cell voltage comprises two parts, the voltage required to decompose the solution and the voltage necessary to overcome the resistance of the solution and of the electrodes. The decomposition voltage of brine is approximately 2.3 volts, and no current will pass through the cell until the applied voltage exceeds this value. The usual operating voltages are from 3 to 7 volts per cell dependent upon the design, temperature, and current density. With a cell having 100 per cent. ampere-hour efficiency operating at a pressure of 2.3 volts the energy efficiency would be 100 per cent. In practice the energy efficiency is between 30 and 75 per cent. The difference in the voltage of different cells depends almost entirely upon the current density and the length of the current path in the electrolyte. This is due to the fact that the resistivity of a 25 per cent., or nearly saturated, brine solution is 1.76 ohms per inch, or 2½ million times that of pure copper. Consequently a great area of electrolyte and a short current path are required to avoid an excessive voltage drop.

Of the electrolytic chlorine cells in commercial operation the *diaphragm* type is the most satisfactory at present on the market. In this type a porous partition, usually consisting of a moulded asbestos compound, separates the anode and cathode compartments, and the flow of the electrolyte itself is made to oppose the passage of the caustic soda to the anode compartment. The gases, chlorine and hydrogen, accumulate above the surface of the electrolyte and are readily drawn off. The caustic soda is removed from the cathode partially by the flowing salt solution and partially by gravity.

The earliest successful diaphragm cell was the Griesheim, first used in Germany in 1890. In this cell an iron container serves as the cathode. The anodes are plates of magnetic iron oxide, and the diaphragms formed of a composition of salt, cement and hydrochloric acid compose the walls of the box-shaped anode compartments. In use the salt dissolves and leaves a very fine porous wall. These cells are steam-jacketed, and the temperature of the electrode is kept between 80 deg. C. and 90 deg. C. The anode current density is from 10 to 20 amperes per square foot.

Of the diaphragm cells in use may be mentioned the Hargreaves-Bird in England; the Finlay in Belfast; the Gutheniu-Chalandre extensively employed in France, Switzerland, and Spain; the Billeter-Leykam in Austria; the Townsend, Le Sueur's, Billeter-Siemens, Allen-Moore, Wheeler, Jewel, and Nelson in the United States of America.

The largest single chlorine plant in the world is the U.S.A. Government plant at Edgewood Arsenal, Baltimore, where over 8,500 Nelson cells are installed for the production of 100 tons of chlorine gas per 24 hours. This plant was installed during the war in four months. In fig. 1 is given an illustration of the Nelson cell embodying the latest improvements. The body of the cell consists of a rectangular tank of ¼ in. steel plate in which a U-shaped cathode of perforated sheet steel is mounted, and acts as the form for the anode compartment. The cathode supports the asbestos diaphragm, and the U-shaped anode compartment is closed at the ends by blocks of cement mortar. The top of the anode compartment is closed by an inverted rectangular box of slate slabs which support the graphite blocks that form the anode proper. The anode blocks are 4 in. by 4 in. by 17 in., and the lugs are 2½ in. in diameter by 12 in. long. They are specially treated, with a consequent increase in their life of more than two years, and they have but one joint, which ensures maximum conductance. The cells are fitted with an automatic feeding device which is simple and has proved reliable in service. It consists of a float on which is mounted a dull knife edge which presses against a piece of rubber tubing through which the brine is supplied to the cell. The slightest rise of the float cuts off the feed entirely, and the smallest drop permits the flow to start again. No trouble is caused by dirt in the brine, as it is purified before passing into the cells, it being essential in the operation of a chlorine cell for iron, alumina, lime, and magnesia to be excluded. The rate of percolation of the brine through the diaphragm is kept uniform by means of steam in the cathode compartment, and this steam also assists in dissolving the caustic soda formed at the cathode as well as in heating the cell, and thus reducing its resistance. Should the pores of the diaphragm begin to close, due to the presence of excessively strong caustic liquor, they can be freed by increasing the amount of steam.

The normal operating period between renewals of the diaphragm is from six to eight months, and during this period the operating conditions remain practically constant. The cells are rated at 1,000 amperes, at which current the most efficient results are obtained, although they can be run as low as 600 amperes without serious loss of efficiency, and will stand a continuous overload of 10 per cent. without damage to the plant or product. The voltage drop is from 3.5 to 3.8 volts with a usual average of 3.7 volts over six months. Plant records show about 90 per cent. ampere-hour efficiency and a 60 per cent. energy efficiency. One of the best features of the cell is that it can be shut down either accidentally or intentionally for short or long periods as often as desired without damage to the cell or serious loss of efficiency. When operated at 1,000 amperes these cells are guaranteed to produce 60 lb. of chlorine and 68 lb. of sodium hydroxide per cell per 24 hours when supplied with a brine solution not exceeding 120 lb. of salt.

In the *mercury* type of cell anodes of carbon with a cathode of mercury are used. The sodium liberated by electrolysis amalgamates with the mercury, and the amalgam is transferred mechanically to an adjacent compartment containing

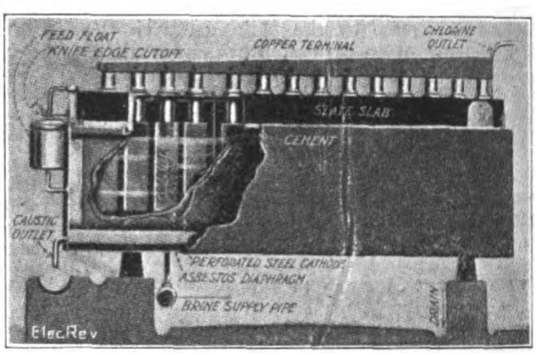

Fig. 1.—The Nelson Electrolytic Cell.

water, by which it is decomposed. Sodium hydroxide is formed with the evolution of hydrogen, and the mercury is freed, and is returned to the electrolytic chamber. The chlorine is collected above the anodes, and the caustic soda so formed is very pure.

In England the Castner-Kellner cell was an early representative of this type. Although the efficiencies are good the initial cost is extremely high. A plant having a capacity of one ton of chlorine per day would contain about 13,000 lb. of mercury. Other mercury cells are the Solvay-Kellner, the Rhodin, and the Wildermann.

The many advantages of the mercury cell are offset by the comparatively large capital outlay involved, and the large floor space required, coupled with the difficulty of removing the impurities from the mercury. The high fixed charges can only be compensated for by low energy costs, so that the mercury cell would appear to be restricted to regions of cheap electric power.

With the *bell* process no diaphragm or mercury is used; the partial separation of the caustic soda and salt solutions is effected by gravity. A bell of non-conducting material coated on its outer surface with sheet iron forms the cathode, and is supported in an open tank. Inside the bell a horizontally surpended carbon plate acts as the anode from which the current flows down through the salt solution, which is fed into the anode compartment, under the edge of the bell and up to the cathode. The chlorine evolved is drawn off through an opening in the top of the bell, and the heavy caustic soda formed at the cathode sinks and is drawn off at the bottom of the tank. The sodium chloride drawn off with the caustic soda crystallises out on concentration of the caustic soda by evaporation. In practice a tank contains 25 bells operating in parallel. Modifications of the original Aussig cell are the Jewell and the Jenkins.

The bell cells are free from diaphragm troubles, reliable in operation, and have small capital and maintenance costs, but they take up a large amount of room, and their energy efficiency is low.

Electrolytic chlorine plants constitute a load of the most attractive type for central stations. For many types of cells the steady amperage at low voltage may be taken directly from a rotary converter at the available pressure, say 110 to 500 volts. For example, cells using 1,500 amperes at 3.5 volts could be connected 30 in series on 110 volts, in which

* *Chemical and Metallurgical Engineering*, Vol. 21, No. 2, pp. 69-72 and Vol. 21, No. 3, pp. 133-136. Abstract.

Digitized by Google

case the required converter capacity would be 165 KW. Such a plant would produce, say, 2,880 lb. of chlorine per 24 hours. Voltage regulation is unnecessary. In addition, such a plant, equipped with the proper type of cell, would permit of off-peak operation.

The increasing demand for chlorine, its numerous products and by-products must lead to the development of a recognised standard type of cell comparable in efficiency; durability, and ease of operation with other electrical apparatus. This ultimate type of cell will doubtless have an energy efficiency above 80 per cent.; it will operate with little attention; it will be unaffected by any interruption in the electrical supply; its elements will, as in the case of the storage battery, require but infrequent renewals; and ordinary impurities in the salt and water will produce no effect upon its efficiency, and will be periodically removed as simply as a boiler is blown off.

That a wonderful expansion is assured to the electrical chlorine industry in the immediate future is an undeniable fact, and is one which cannot fail to attract the closest attention, not only on the part of the chlorine manufacturer and the industrial engineer, but those in charge of electricity supply.

TIDAL POWER.

So far no tidal power development of any appreciable size has been carried out, although the idea is an old one. The present high cost of fuel and water power development in general has, however, revived interest in the subject, and the commercial possibility of such schemes is at the moment receiving serious consideration both in this country and in France. According to an article on the subject in the June 3rd issue of *Nature*, from which the following particulars are derived, the power which may be developed from a tidal basin of given area depends on the square of the tidal range, and since the cost per H.P. of the necessary turbines and generating machinery increases rapidly as the working head is diminished, the cost per H.P. of a tidal-power installation, other things being equal, will be smallest where the tidal range is greatest. It is for this reason that the western, and especially the south-western, coasts of Great Britain, and the western coast of France, are particularly well adapted for such developments, since the tidal ranges are greater than in any other part of the world, with the possible exceptions of the Bay of Fundy, Hudson's Bay, and Port Gallelos, in Patagonia.

In Great Britain the highest tides are found in the estuary of the Severn, the mean range of the spring tides at Chepstow being 42 ft., and of the neap tides 21 ft. In France the maximum range occurs at St. Malo, where it amounts to 42.5 ft. at spring tides, and about 18 ft. at neap tides. The tidal range in the Dee is 26 ft. at springs, and 12 ft. at neaps, while the mean range of spring tides around the coast of Great Britain is 16.4 ft., and of neap tides 8.6 ft. The article briefly outlines and compares the five most promising schemes of development that have been suggested, and goes on to point out that the great difficulty in developing a tidal scheme as compared with an orthodox low head water-power scheme arises from the relatively great fluctuations in head. In the case of the Severn, for example, the working head at springs would be twice as great as at neaps, and the energy output per tide would be four times as great at springs as at neaps, while at St. Malo the output would be 5.5 times as great at springs as at neaps.

Not only is the installation subject to this cyclical fluctuation of head, but in any simple scheme the turbines also cease to operate for a more or less extended period on each tide; and this idle period will gradually work around the clock, and will, at regular intervals, be included in the normal industrial working day.

In any installation, then, designed for an ordinary industrial load, unless the output is cut down to that obtainable under the minimum head available at the worst period of a neap tide, in which case only a very small fraction of the total available energy is utilised and the cost of the necessary engineering works per H.P. will, except in exceptionally favourable circumstances, be prohibitive, some form of storage system forms an essential feature of the scheme.

Various storage systems have been suggested. Electrical accumulators must be ruled out, if only on account of the cost, and the same applies to all systems making use of compressed air. The only feasible system appears to consist of a storage reservoir above the level of the tidal basin. Whenever the output of the primary turbines exceeds the industrial demand, the excess energy is utilised to pump water into the reservoir, and when the demand exceeds the output from the primary turbines it is supplied by a series of generators driven by a battery of secondary turbines operated by the water from the storage reservoir.

Evidently this method is available only when the physical configuration of the district affords a suitable reservoir site within a reasonable distance of the tidal basin. Unfortunately also considerable losses are inevitable in the process. Where two tidal schemes at some distance apart differ sufficiently in phase, it is possible to work the two in conjunction, but this does not affect the necessity of storage as between spring and neap tides.

The prospects of tidal-power schemes would be much more promising if the whole of the output could be utilised as it is generated. By feeding into a distributing main in conjunction with a large steam station and/or inland water power scheme, and delivering to an industrial district capable of absorbing a comparatively large night load, such a state of affairs might be realised, at all events approximately. There is also the possibility that the intermittent operation of certain electro-chemical processes may be developed so as to enable any surplus power to be absorbed as and when available, and, if so, power developed tidally will probably prove cheaper in this country than that developed from any other source.

Owing to the relatively large variations in working head in any simple scheme, and to the small working heads, the design of hydraulic turbines capable of giving constant speed with reasonable efficiencies, and of moderately high speeds of rotation, is a matter of considerable difficulty. Modern developments, however, promise much better results in both these respects.

Even with such turbines, the number of technical problems to be solved before a tidal scheme of any magnitude can be embarked upon with confidence is large. The questions of single- *versus* double-way operation, of storage, of the effect of sudden changes of water-level due to strong winds, of wave effects, of silting in the tidal basin and of scour on the down-stream side of the sluices, of the best form of turbine and of generator, and of their regulation and of that of the sluice-gates, are probably the most important, though not the only, subjects to consider.

On the other hand, the possibilities of tidal power, if it can be developed commercially, are very great. Assuming a mean tidal range of only 20 ft. at springs, and 10 ft. at neaps, and adopting the single-basin method of development with operation on both rising and falling tides, each square mile of basin area would be capable, without storage, of giving an average daily output of approximately 110,000 H.P.-hours. In such an estuary as the Severn, where an area of 20 square miles could readily be utilised with a spring tidal range of 42 ft., the average daily output, without storage, would be approximately 10,000,000 H.P.-hours.

At the present time it is difficult to obtain even a rough estimate of the total cost of such a scheme, owing to the uncertainty regarding many of the factors involved. The whole question would appear to merit investigation, especially on matters of detail, by a technical committee with funds available for experimental work.

British Canals.—A Committee on Inland Waterways has been appointed of which Mr. Neville Chamberlain, M.P., is chairman, and Mr. Arthur Sharp, Development Department, Ministry of Transport, 8, Whitehall Gardens, S.W.1, is the secretary.

The terms of reference are: To consider and report as to:—

1. What portions, if any, of the inland waterway system of the country should be acquired by the Ministry of Transport with a view to improvement, and upon what terms; what should be the form of ownership of such acquired portions, whether under the State, through a Department of the Ministry of Transport, or through a Regional Trust, or by any other methods; and

2. If a trust be recommended, what should be its constitution and the nature of its governing body?

3. What improvement should be carried out in such acquired portions? What would be the cost of the improvement, and how should the necessary funds be raised? Whether such acquired or improved portions would become self-supporting, and, if not, what deficit would be involved, also what indirect advantage would be obtained to compensate therefor?

4. What method should be adopted to ensure that any improvement in the value of the frontages should be secured, in part at least, to the body carrying out the improvement to the waterway?

5. In what manner could co-operation best be developed between transport by water and transport by rail or road?

The Output of Coal.—According to figures quoted in the *Times*, the output of coal for the week ended May 22nd was 4,830,707 tons, against 4,860,668 tons in the previous week and 4,674,302 tons in the corresponding long week in Northumberland and Durham. The output of coal from mines under the Coal Mines Act, which had fallen from 287,411,869 tons in 1913 to 227,714,579 tons in 1918, rose to 229,743,128 tons in 1919. The number of persons employed was 1,191,313, an increase of 182,446 persons on the figures for the year 1918, and an increase of 63,423 persons on the pre-war year of 1913. The figures show an increase on the pre-war figures of 5.6 per cent. in the numbers employed, but a decrease of about 20.1 per cent. in the output. The average output per person employed underground fell from 332 tons in 1913 to 253 tons in 1919, and the average output per person employed under and above ground from 267 tons to 201 tons.

BUSINESS NOTES.

Cycles for Disabled Men.—A Rally and Demonstration of Cycles for war-maimed men is taking place to-morrow, Saturday, June 12th, at 2.30 p.m., in the Inner Circle, Regent's Park, London, N.W. It has been organised by the editor of the *Motor-Cycle and Motor Trader*. Eighteen British makers of hand-propelled and motor-assisted cycles have signified their intention of taking part in the Rally, with close upon 50 machines, but an open invitation is extended to all actual users of hand-propelled cycles in the London area to take part, and it is expected that in consequence fully 100 machines will be present. One of the firms participating is Messrs. Carters, Ltd., of New Cavendish Street, W., who are sending one of their electrically-propelled bath chairs.

Manchester Steam Users' Association.—The annual report of the above association for 1919, announces that the total number of members is now 2,006, and the total revenue for the year was £27,850, but there was a resultant deficit of £5,121. The gross number of inspections carried out was 22,256, and no boiler under inspection and guarantee burst during the year. The chief engineer received the honour of O.B.E. during the period covered by the report, for services in connection with the war.

Extension of the Uses of Rubber.—The Rubber Growers' Association has decided to offer £5,000 as prizes, in the form of a competition for ideas and suggestions for extending the present uses, or for encouraging new uses, of rubber. A pamphlet has been issued containing full particulars and conditions of the competition. Copies can be obtained from the Secretary of the Association, at 38, Eastcheap, London, E.C. 3. There will be one prize of £1,000, three of £500, ten of £100, and £1,500 will be divided between the remaining competitors whose suggestions are considered to be of value.

A Congress and Exhibition at the Hague.—A Congress of the Government and Local Roads Authorities will be held at the Hague from September 15th to the 26th this year. The Congress will consist of the Government engineers who have charge of the main roads, and the provincial councils and engineers who are responsible for the maintenance of the smaller roads, also the municipal authorities who have under their charge streets and town thoroughfares. An important feature will be that an exhibition is to be held at the same time of road-making materials, machinery, &c., and of the various makes of commercial motors suitable for road transport. As the question of road-making and maintenance is of increasing importance, in view of the development of road transport, the Exhibition Section of the Federation of British Industries, for the convenience of British manufacturers, has undertaken the representation of this exhibition in England.

With regard to commercial motor-cars suitable for road transport, no lorry manufacturers exist in Holland. There is only one firm manufacturing ordinary passenger automobiles, and only two firms manufacturing motor tires on a small scale. For the interest of British firms, manufacturers, and engineers, it may be said that the exhibits will cover everything to do with roads, including maps, models, and statistics, machines used in road-making, and all the equipment necessary for the beautifying and illumination of streets and thoroughfares. On the transport side, exhibits will cover motor-lorries, commercial vehicles, spare parts, tires, accessories, motor fuel, motoring equipment and clothing. The Federation is in possession of full information, and can arrange all details for those who wish to exhibit or to visit the exhibition. Inquiries should be addressed to the Exhibition Section of the Federation of British Industries, 39, St. James's Street, London, S.W. 1.

Annual Outings.—The staff of Messrs. Primrose and Primrose, electrical engineers, Glasgow, held their annual sports outing at Whistlefield, on Saturday last. The principals, Messrs. James and Clifford Primrose and Mr. R. Spencer Smith, were present. There were several exciting and amusing contests, including a five-a-side football match between the various departments. Mrs. James Primrose presented the prizes.

The staff outing of the Electrical Supplies Co., of 233, Tottenham Court Road, took place on Saturday, June 5th. The party travelled by motor char-à-bancs to Marlow, and carried through a very fine programme. At the luncheon, Mr. Percy L. Davies (managing director) thanked the staff for their energetic work during the past 12 months, particularly those who had borne the anxiety of the early days, and congratulated them on their having brought the year to such a successful termination. In the evening a concert programme, under the direction of Mr. S. A. Coleman, was rendered and thoroughly enjoyed.

The Strike at Levers and Co-partnership.—The electricians, E.T.U. men, who were recently on strike at Lever Bros., Port Sunlight Works, have had their co-partnership benefits cancelled.

The Wimbledon Dispute.—The dispute between the Corporation and E.P.E.A. with reference to the previous decision of the Corporation not to pay the bonus of £30 granted by the National Joint Board of Employers and Members of Staffs to the technical staffs of electricity supply undertakings has now been settled. The E.P.E.A. at the request of the Ministry of Labour and other authorities agreed to defer any action until after the meeting of the Council on the 2nd inst., whereat a resolution agreeing to pay the bonus was passed by the Council. This has been made effective by another resolution of the Council passed on the 4th inst., rescinding the previous resolution not to pay the bonus.

Mr. W. A. Jones, general secretary to the E.P.E.A., informs us that the satisfactory settlement of this dispute is due in no small measure to the persistent interest of the Electric Lighting Committee and its chairman, Councillor Hatherly-Mynott, in the staff of the department under its control, and the energetic measures taken by the Mayor, Alderman D. Stuart, to deal with the situation that had arisen.

The influence of the National Joint Board through its constituent associations was also an effective contributory factor to the settlement.

The Merchant Trade in Germany.—It is announced that a number of merchant and export firms in the electrical industry have formed a community of interests to protect themselves against the inconveniences which have arisen in connection with the supply of electrical manufactures to merchants and exporters by makers, and against the threatened stoppage of the export trade by Government measures, particularly the export duty of 6 to 10 per cent. of the value.

Motor-Cycle Records.—The new British motor-cycle records recently set up for 100, 150, 350, 400, 450, and 500 miles, and for 1, 2, 3, 8, 9, 10, 11, and 12 hours were made by riders using British magnetos—the C.A.V.

French Company Notes.—There has been established at Paris (95, Rue Saint Lazare) the Société Phénicienne de Force et Lumière, with a capital of 500,000 fr. for the utilisation of all forms of electric energy.

With a capital of 300,000 fr., the Société Voltampère has been constituted at Paris (30, Rue des Trois Bornes) for the manufacture and trade in electrical fittings.

Ferdinand et Jean Guerpillon is the style of a company formed at Paris (4, Rue du Borrégo) to carry on the business of electric measuring apparatus makers of Mrs. Graindorge. The capital is 250,000 fr.

There has been constituted at Paris, under the name of Chesni et Cie. (4, Rue Léon Cosnaro) a company with 100,000 fr. capital for the purchase, sale, and installation of electro-mechanical appliances, the installation of high and low-tension networks, power stations, transformer posts, &c.

The Société Andelysienne d'Electricité (11, Rue de la Tour des Dames, Paris) has written down its capital from 1,500,000 fr. to 750,000 fr., and increased its capital to 5,000,000 fr. Eventual increase to 10,000,000 fr. rests with the Directorate.

Hamès, Laborie et Cie. has been incorporated (109, Rue de Sèvres, Paris) for trade in electrical apparatus, more particularly an apparatus to prevent motor-car thefts.

The Société Hydroélectrique de la Haute Bourne, of Grenoble (capital 500,000 fr.) has been dissolved, its assets having been acquired by the Société Hydroélectrique de Vizille, which discharges the former's liabilities.

There has been formed at Lilas (Avenue Pasteur 98) as a company, C. Demarquest et Cie., for electrical and mechanical construction. Its capital is 150,000 fr.

Under the style of Le Progrès Mécanique L.Parmentier et Cie. has been constituted a company at Clichy (39, Rue de Villeneuve), with a capital of 100,000 fr. for the manufacture and sale of all kinds of telephonic, electrical and mechanical apparatus and accessories.

Australian Tariff Affects Tramways.—Schemes of tramway development in the Commonwealth, it is said, are likely to be checked, if not crippled, by the extra duties placed in the new tariff upon imported rails. A scrutiny of the tariff reveals that the duties on all steel rails, including tramway rails, have been raised from 17s. 6d. to 35s. and 65s. a ton, according to the country of origin. While these duties are intended to give extra protection to Australian manufacturers, it is pointed out that owing to plant suitable for the manufacture of tramway rails not being available it will be impossible for some considerable time to come to draw supplies from Australian sources.—*Melbourne Herald.*

British Empire Exhibition in London.—It is intended to hold in London in 1923, or at such earlier date as may prove possible, a great British Empire Exhibition, which will demonstrate the magnitude of the resources and productive power of all parts of the Empire. A meeting was held at the Mansion House on Monday last, at which communications from the Prince of Wales and the Prime Minister were read. Viscount Milner, Secretary of State for the Colonies, urged the claims of the Exhibition, and other speakers were the Right Hon. W. A. Watt, Sir George Perly, and Sir Robt. Horne (President of the Board of Trade). Mr. H. G. Williams, secretary of the Machine Tool Trade Association, speaking from the body of the hall, expressed regret that the Government had given approval to a long-period exhibition. Exhibitions were among the best advertising media, but six-months' exhibitions which formed a fair ground were not the best method of promoting British trade.

Plant for Sale.—Whitby Urban District Council invites offers for one 100-kw. Parsons turbo-alternator, and one 28-h.p. vertical-enclosed engine complete. Heckmondwike Urban District Council Electricity Department has for disposal one 75-kw. Reavell-Fowler generating set, and one 465/550-volt D.C. Fowler generating set. For further information, see our advertisement pages to-day

Catalogues Wanted at Charleroi.—The British Vice-Consul at Charleroi (Mr. J. P. Macgregor) reports that a special catalogue and sample room has been opened there, and he would be glad to receive catalogues (if possible in French) from British manufacturers, as well as small samples of all kinds, for exhibition. Notices are sent to the local Press at regular intervals of all catalogues and samples received, and every effort is made to bring these to the notice of Belgian importers.

Lead.—Under date June 5th, MESSRS. G. CAWSON & Co. report :—

The export demand has been very poor, and general trade seems to have become decidedly worse, so that home consumers are only taking very limited quantities of lead. Even the demand for electrical purposes appears to be falling off. If this situation continues, we are afraid the prices may further decline. There is no lack of lead coming forward; in fact, it is sometimes difficult to get rid of metal, as it arrives without going to the expense of warehousing. Reports from producing countries look more favourable.

On the same date MESSRS. JAMES FORSTER & Co. reported :—

There is no change in the general position. . . . There is still no quotation of lead on the New York market, a condition which has existed for weeks past. On the other hand, consumers, as is usual in such market conditions as this week, are little in evidence. Export business is quiet, and conditions in the City, financial and otherwise, continue to exert an adverse influence all round. It may safely be said that, with anything like normal consumption and conditions, the supplies to be expected in the next few months are totally inadequate.

Tasmanian Hydro-Electric Plant.—A newspaper report from Tasmania states that the State Hydro-electric Department is making extensive purchases of machinery in connection with developmental work at Waddamana, Lake Rolleston, Launceston, and Bridgewater. It is alleged by the Department that, despite the fact that all machinery which cannot be manufactured in Australia is supposed to be admitted free of Customs duty, Tasmania has to pay many thousands of pounds a year in duty on machinery from England and America which admittedly cannot be made in the Commonwealth. Mr. Hayes (Minister for Works) stated, in April, that under the new tariff the Hydro-electric Department would be hit very hard, and he hoped that something would be done by way of amendment before the proposals passed the Federal Parliament.

The Norwegian Aluminium Co.—The report of the A. S. Hoyangfaldene Norsk Aluminium Co., which was presented at the annual meeting held at Christiania on June 1st, states that the production of carbide, iron and electrodes had been discontinued and the remainder of the raw materials been sold. The production of aluminium was started, and would be increased gradually as larger supplies of alumina were received, which would depend, in the first place, upon the output in France. Unfortunately, considerable disappointment had been caused through the delay in the delivery of machinery by the European firms, but the machinery had now arrived, and experimental working for the essential part of the works had been begun. The work undertaken in the direction of the production of alumina from Norwegian raw materials was continued and brought to a close in the course of the year. The method had been carried out by an expert committee, who characterised it both technically and economically as possessing the competitive capability of solving the question of the production of alumina from native clay. As, however, the war was over, and the delivery of supplies of alumina could be reckoned on from France, the directors did not find any reason for the present for taking up the production according to this method. During the work of endeavouring to ensure further supplies of raw materials, they had paid special attention to comprehensive and valuable deposits in Surinam, Dutch Guiana. The subsidiary formed by the company—the N.V. Nederlandsche Mijn Exploratie en Exploitatie Maatschappij—in which the company held the majority of the shares, had now been granted a concession by the Dutch Government for these deposits. In the case of the A. S. Nordisk Aluminium Industri, of Holmestrand, which is also a subsidiary company, the report states that the installation had so far been completed that it had been possible to commence production. The accounts show a deficit of 1,336,000 kr. for the year, during nine months of which practically no manufacturing was carried on. As to the future prospects, the directors remark that the demand for aluminium is considerable, and prices are favourable, and should yield good profits as soon as the works are in full operation.

Italian Government Electrical Contracts.—During 1919 the Italian Government placed contracts for the following electrical plant :—

Copper wire	10,000,000	lire
Telephone cable...	4,000,500	,,
Telephonic apparatus	1,000,000	,,
Cord	350,000	,,
Dry and wet batteries	230,000	,,
Covered wire	220,000	,,
Insulators...	1,300,000	,,
Poles	750,000	,,

The above is exclusive of contracts for large canalisation works, power station equipment, &c.

German Representation.—Judging by copies of a letter which we have received personally, and had brought to our notice otherwise, a German firm of meter makers is circularising the electrical profession broadcast with a view to securing a London representative. A correspondent suggests that this is the beginning of "peaceful penetration"; but that, we believe, began again in November, 1918.

A Canadian Exhibition in London.—The Canadian Industries Exhibition, which was formally declared open by Sir G. McLaren Brown, of the C.P.R., on Monday last, remains open until 17th inst. It is being held at the Royal Agricultural Hall, Islington, and any reader who wants to come closely into touch with Canadian affairs should make an effort to inspect the exhibits during the remaining few days. The display affords a very convincing evidence of the great industrial strides that Canada has made since 1914, directly as the result of war-time manufacturing operations. Six years ago the exports of Canadian products were chiefly of agricultural and raw-material descriptions, but since the war-time factories have turned over to peace-time operations, an export trade in manufactured goods has been developed, which bids fair to reach large proportions. Sir G. McLaren Brown said that the possibilities of Canada industrially were limitless, by reason of her geographical position, her vast and varied national resources, her practically unlimited navigable waterways, her healthy climate, and the energy of her people all of which made for low cost of production, operation, and distribution. This had been recognised already by their cousins to the south of the border, and many American factories had been established in Canadian territory. As a Canadian, he was glad that the advantages of Canada as a country for manufacturing were coming to be recognised by manufacturers in England who proposed to establish branch factories. They would never regret it.

The exhibits are of a varied nature, indicating activity in steel products, polishes, gas engines, bicycles, steam-heating apparatus, leather goods, agricultural machinery, paints and varnishes, electric irons, toasters and vacuum cleaners, enamelled ware, furniture, pianos and organs, lathes and hand-saws, petrol engines, engineers' tools, and products of the Canadian Electro-Products Co., Ltd., and the Canada Carbide Co., whose works are at the Shawinigan Falls. At the time of our visit the Hoover electric suction cleaner was receiving a good deal of attention. Cinematograph films of general life in Canada, also industrial films, are being shown free in the King Edward's Hall, morning, afternoon, and evening. Mr. H. Greville Montgomery, who has been responsible for the Exhibition, is to be congratulated upon the measure of success that has attended his efforts, in spite of most exceptional difficulties. The Exhibition is the first of its kind held in London, but it will, unless we are mistaken, be followed by many others as Canadian export trade grows, as it seems destined to do, in the coming years.

British Engineering Firms and Manufacturing in Australia.—According to the Melbourne *Age* for April 12th, representatives of Vickers, Ltd., have been on a tour of inspection of the various engineering works in the Commonwealth for the purpose of investigating the possibilities of the extension of the engineering industry in Australia. The members of the party included J. S. Redshaw, shipbuilding expert; L. Lawrence, marine engines; Captain F. W. Turner, Rolls Royce engines; A. E. Meaden, motor cars. "It is believed that the firm of Vickers, Ltd., which at present has a contract for the construction of three of the 15,000-ton vessels for the Commonwealth Government, is contemplating the extension to Australia of the various branches of its activities, including shipbuilding, aeroplanes, &c." Amongst the party was Mr. W. L. More, the representative in Australasia for Boving and Co., manufacturers of water turbines, and he was also investigating the possibility of the machines being constructed in Australia instead of, as hitherto, being imported.

The Salvage of Oily Rags, &c.—Oily rags have hitherto been numbered amongst the things that are difficult to dispose of, except in a furnace; but the war has taught us many things with regard to the salvage of waste materials, and the Ministry of Munitions erected special plant for extracting oil from rags, which were afterwards cleansed and sold to textile or paper mills. The manager of this plant was Mr. L. St. Clare Roberts, who purchased it after the Armistice was signed, and transferred it to his new mills at Plaistow. A company has been formed under the style of Roberts, Paton & Co., Ltd., Chapel Mills, Eve Road, London, E. 15, which delivers steel drums, free of charge, to customers in the London area, or free on rails for country customers, and collects them when full of oily rags, paying for the latter. Rags are much cheaper than cotton waste, and are more absorbent; for these reasons they were adopted in all the workshops of the Royal Air Force, and engineering firms are following this example.

Company Liquidations.—ELECTRIC SMELTING CO., LTD.—Winding up voluntarily. Liquidator, Mr. G. A. V. Narraway, 36, Queen Victoria Street, E.C. Meeting of creditors, June 14th.

SURREY ELECTRICAL CO., LTD.—Meeting of creditors is called for June 17th, at 227-8, Gresham House, Old Broad Street, E.C.

ELECTRIC TRAIN LIGHTING SYNDICATE, LTD.—A meeting is called for July 6th, at 4, Central Bank Chambers, Leeds, to hear an account of the winding up from the liquidator, Mr. G. Parish.

ROTASPHERE, LTD.—A meeting of creditors was called for June 10th. Liquidator, Mr. A. S. Jopp.

FULLER'S WIRE AND CABLE CO., LTD., FULLER'S CARBON AND ELECTRICAL CO., LTD., THE FULLER ACCUMULATOR CO., LTD., and J. C. FULLER & SON, LTD.—Final meetings of members are called for July 7th at Keenan's House, Crown Court, Cheapside, E.C. Liquidator, Mr. H. M. Morris.

D. HULETT & CO., LTD.—A meeting of members is called for July 1st, at 1, Walbrook, E.C., to hear an account of the winding-up from the liquidator, Mr. J. D. Broad.

FALKIRK IRON CO., LTD.—Meeting of creditors at 43, Vicar Street, Falkirk, on June 21st. Liquidator, Mr. J. Hastings. This liquidation is for purposes of reconstruction. All creditors will be paid in full.

Digitized by Google

Catalogues and Lists.—The Imperial Electric Works, 7-12, Imperial Mews, St. Martin's Avenue, East Ham, E.6.—Illustrated leaflet describing Browning's electrically-heated soldering iron.

"Rainbow" Artistic Shade Co., 30, Laurel Road, Fairfield, Liverpool.—An illustrated folder giving designs and prices of various types of silk lamp shades.

Messrs. Bruce Peebles Co., Ltd., Edinburgh.—Pamphlet No. 21 D (20 pp.). An illustrated catalogue of self-contained, medium-size D.C. dynamos and motors. The list gives full specifications and weights and dimensions in British and metric units.

Igranic Electric Co., Ltd., 147, Queen Victoria Street, E.C. 4.—Pamphlet No. 6,007, an illustrated leaflet entitled "Electric Coil Winding," showing various types of coils and windings.

Book Notices.—"Report of the Labour Co-partnership Association for the Year 1918." London. 3d.—The annual meeting takes place in London (at the Guildhall), on Wednesday, June 16th, at 3 o'clock. Lord Robert Cecil, K.C., M.P., will preside; Mr. W. A. Appleton will deliver address, and Sir George Gibb will be one of the other speakers.

"Umsturz der Einsteinschen Relativitätstheorie." By A. Patschke. Berlin-Wilmersdorf: from the author.

"Lectures on Industrial Administration." Edited by B. Muscio. Pp. vii + 276. London: Sir I. Pitman & Sons, Ltd. Price 6s. net.

Scientific Paper No. 374 of the U.S. Bureau of Standards. "An Integration Method of Deriving the Alternating Current Resistance and Inductance of Conductors" (32 pp.). Washington: Government Printing Office. Price 10 cents.

"Report of the British Chamber of Commerce of Turkey and the Balkan States (Inc.) for the Years 1914-19." Constantinople.

Bankruptcy Proceedings.—C. J. T. Hayman, electrical engineer, 76, Malvern Road, Leytonstone.—Receiving order made June 2nd, on debtor's own petition. First meeting, June 15th; public examination, July 16th, both at Carey Street, W.C.

Bernard Pordes, lately carrying on business under the style of the United Electrical Manufacturers Co., at 18-22, Christopher Street, E.C.—Accounts have been filed at the London Bankruptcy Court showing total liabilities £7,190 (unsecured £6,525), and assets consisting of book debts for £448, estimated to produce £160. The debtor manufactured electric pocket-lamp batteries, and he attributes his present position chiefly to losses, estimated at £12,000, sustained through the supply of bad chemicals; also to loss of £2,000, costs of an action brought against him by a foreman for unjustifiable dismissal. The public examination was to have been held on June 8th, before Mr. Registrar Mellor, but Mr. W. Boyle, Official Receiver, reported that he had called upon the debtor to file cash and goods accounts, and both he and the trustee required time for purposes of investigation. By general consent the sitting was adjourned till July 20th.

A German Order.—According to the *South Wales Daily News* for June 4th, the A.E.G. turbo-alternator of the Newport Corporation Electricity Committee is out of repair, and the engineer reported that it was very likely it would be found impossible to find any firm in the United Kingdom willing to undertake the repairs. He thought that the Committee would have no alternative but to place the work with the A.E.G. Co., Berlin; but if this course was adopted it would be advisable to place an order for a new rotor, for which they had quoted £1,000 at a rate of exchange of 200 marks to the £1. The Committee recommended that the new rotor be purchased. The *Daily Sketch* of June 8th gave the price as £1,600, and stated that a section of the Council strenuously opposed the proposal to place the order in Germany, but the chairman of the Tramways Committee pointed out that as the original machine came from Germany, English firms would not consider its repair for fear their employés would refuse to handle it, and because they said they were overwhelmed with orders. The recommendation was adopted.

Cape Town.—The Electrical Trades Union sent in a demand, through the Federation of Trades' secretary, to the Electrical Contractors' Association at Cape Town for a minimum wage of 3s. 6d. per hour, with 75 per cent. of this amount for apprentices of four years' standing. The time limit was June 8th, at which date the demand of the building trades' employés for 4s. per hour also matured.

Trade Announcements.—Mr. E. M. Parsons, electrical contractor, who has been established at 67, King Edward Street, Hull, for over 17 years, is removing, on 14th inst., to larger premises at 38A, Brook Street, Hull. Telephone number unaltered: "Central 5180."

Mr. F. J. Hurst, for many years associated with the selling organisation of Messrs. Brown Bros., Ltd., motor and aircraft factors, has recently gone over to the Aircraft Disposal Co., Ltd., and is now installed at their sales headquarters at Regent House, Kingsway.

Mr. P. Baxter has commenced business as an electrical engineer at 29, Westgate, Grantham.

Mr. G. C. Barnes, electrical engineer, has opened new premises at Regent Street South, Barnsley.

Mr. A. B. Cartland has opened an office at 3, Creechurch Lane, Leadenhall Street, E.C. 3, where he is specialising in fuel-economising and smoke-abatement appliances, including the patent Sandwich system of boiler firing and the Gallagher-Crompton baffle bridge, also the boiler efficiency calculator.

Auction Sale.—By direction of the Disposal Board Ministry of Munitions, Mr. C. D. Phillips will sell by auction on June 22nd and following days at the National Carriage and Box Repair Factory, Newport, Mon., the factory plant, machine tools, electric motors, generating sets, &c. For full particulars see our advertisement pages to-day.

Dissolution of Partnership.—Munday & Prior, agents and engineers, Belfast and Dublin.—Partnership dissolved. Mr. E. P. Prior has opened offices and stores at 44, King Street, Belfast, as wholesale electrical engineer, and has been appointed agent in Ireland for the Electric Construction Co, Ltd., the Sun Electrical Co., Ltd., and the New Pelapone Engine Co., Ltd.

Foreign Trade.—May Figures.—The following are the values of imports and exports of electrical goods and machinery in May:—

	May. 1920.	*Inc. or dec.*	*5 months, 1920 Inc. or dec.*
Imports.	£	£	£
Electrical goods, &c. ...	111,417	— 12,717	— 119,699
Machinery	1,517,839	+ 404,834	+ 988,344
Exports.			
Electrical goods, &c. ...	1,005,210	+ 555,640	+2,366,684
Machinery ...	4,851,193	+2,348,683	+9,352,068
Re-exports.			
Electrical goods, &c. ...	15,913	— 8,422	+ 8,450
Machinery	157,067	+ 94,657	+ 349,996

Copper and Lead Prices.—Messrs. F. Smith & Co. report, June 8th:—Copper (electrolytic) bars, £110, £1 increase; ditto sheets, no change; ditto wire rods, £125, £1 increase; ditto H.C. wire, no change; silicium bronze wire, no change.

Messrs. James & Shakespeare report, June 9th:—Copper bars (best selected), sheets and rods, no change; English pig lead, £39, a reduction of 30s. on the week.

Draughtmen's Association.—At the half-yearly Conference of the Association of Engineering and Shipbuilding Draughtsmen, concluded at Blackpool, yesterday, the membership was stated to be over 15,000. Success in securing improved conditions was reported, and it was announced that the activities of the Association with regard to technical matters were increasing. Resolutions were passed protesting against the inclusion of draughtsmen and staff workers generally within the Unemployment Bill, and objecting to the further waste of public money on the maintenance of Employment Exchanges.—*Daily Telegraph.*

LIGHTING AND POWER NOTES.

Accrington.—Price Revision.—The Corporation has appointed a Sub-Committee to consider a further revision in the prices of electricity, consequent on recent increases in coal and working charges.

Australia.—Tasmanian Water Power.—Operations are to be commenced shortly upon the Lake Rolleston hydro-electric scheme, which has been designed to supply power to the Read-Rosebery Co. for treating zinc ore.

Sydney Electricity Supply.—The Sydney undertaking supplies over 30 municipalities with electricity, and, as all the agreements were made before the war, charges have not been increased, with consequent loss to the city. The only safeguard possessed by the Council at present is to demand a guarantee that a certain minimum quantity of power will be taken, before new mains are laid. The City Council is endeavouring to get the municipalities concerned to agree to an increase in prices to place the undertaking in a better financial condition.

Barnstaple.—Extensions.—The Town Council, on May 31st, adopted a scheme for extending the electricity works at an estimated cost of £39,000. Mr. J. S. Highfield, the expert called in to advise on the extension, is to carry out the scheme on the terms quoted by him, namely, 5 per cent. on the total outlay.

Batley.—Loan.—The Electric Lighting Committee is applying to the Ministry of Health for sanction to borrow £4,600 for mains extensions and services.

Belfast.—Loan.—The Corporation is applying for sanction to a loan of £30,000 for expenditure upon the electricity undertaking.

Birmingham.—Committee's Report.—A report of importance was presented at a recent meeting of the City Council by the Electric Supply Committee. It dealt with, among other things, the annual accounts of the department, which showed that the additional capital raised during the year amounted to £101,091, and the capital redeemed to £158,240. The outstanding debt was thus reduced by £57,149 to £1,881,628. The total amount of capital redeemed to date was equal to 34·3 per cent., and the net expenditure on this account was £110,879, chiefly in respect of the Nechells permanent station scheme. Dealing with revenue, the Committee stated that the quantity of electrical energy sold was nearly 128 million units, being a decrease of about 13 millions, or 9·22 per cent. There was a heavy fall during the earlier part of the year, but during the last half, the sales improved progressively,

Digitized by Google

being 22½ per cent. greater during the March quarter than in March, 1919. This improvement was maintained, and the gross revenue from consumers exceeded the previous year's total by 12·4 per cent. The increased expenditure and costs per unit were, to some extent, met by the authorised increases in charges to consumers which applied to the last seven months of the year. The principal increases in expenditure were in respect of coal, repairs, and rates and taxes, and wages had also advanced. The Committee explained further that considerable capital payments would have to be met before March, 1921, in respect of the Nechells permanent station scheme, and it was deemed necessary to set aside a further £10,000 towards meeting interest charges, &c., on this temporarily unproductive expenditure during the construction period. They considered also that it was necessary to strengthen the renewals and special expenditure reserve, in view of the present heavy costs of engineering works which were likely to remain at a high level for some time. Having regard to the recent advance of coal, it was necessary to revise the charges for electricity supplies. It was recalled that the City Council had sanctioned an increase in July, 1919, since which date, in addition to the present advance in coal prices, many other costs of production had increased. The additional rates on the assessment of the undertaking this year would amount to nearly £30,000 more than in the year just ended, whilst wages, salaries, repairs, &c., were estimated to cost a further £32,000. The addition to the department's coal bill, due to the present advance, would be nearly £70,000; a large proportion of this was, however, automatically recovered from the large power users on the terms of their high-tension agreements, and this also applied to traction supplies.

Blackburn.—AUXILIARY TURBINE.—Blackburn Corporation has authorised the purchase of a turbine at Throstle Street Destructor Works, in order that it may be run by steam supplied by the cleansing department to relieve the pressure on the electricity works during the winter months.

Burnley. — DISTRICT COMMITTEE. — Burnley, Colne, Nelson, Accrington, and Rawtenstall have formed a District Committee to act together in all matters arising from the formation of a Joint Electricity Authority for this area under the Electricity (Supply) Act, 1919.

LOAN.—The Town Council is making application to the Electricity Commissioners for sanction to borrow £45,000 (making, with £75,000 previously applied for, £120,000) for carrying out proposed extensions at the electricity works, and the purchase and installation of the necessary plant; also for sanction to borrow £20,000 for the installation of mains during the ensuing two years.

Burton-on-Trent.—YEAR'S WORKING.—There was a net profit on the electricity undertaking during the past year of £1,427, as compared with £5,258 in the previous year. An additional capital expenditure of £2,385, however, has been contributed out of revenue this year, including £1,288 for an electric lorry. £1,000 of the profit has been contributed towards the relief of the rates, the balance being transferred to the renewal fund.

Ceylon.—HYDRO-ELECTRIC PROJECT.—The *Times of India* states that the Ceylon authorities are considering a proposal to develop the island's water power. The initial cost of the scheme would be about nine million rupees, and a further three millions would be required for later extensions. The difficulty in obtaining machinery and the probable reluctance of power-plant owners to scrap their present plant are two great difficulties in the way of this proposal.

Darlington.—EXTENSIONS.—The Town Council is applying for sanction to borrow £104,000 for extensions to buildings and plant. Accommodation is to be made for two 5,000-KW. sets, but only one set and boilers will be installed at present.

Dartford.—EXTENSIONS.—The Urban District Council has applied for a loan of £14,928 for a boiler, duplicate bus-bars, mains extensions, and a rotary converter. A low-tension main to cost £1,865 is to be laid, in order to supply electricity to the works of Burroughs, Wellcome & Co., Ltd., and the Monazite Products, Ltd.

Darwen.—MAINS EXTENSIONS.—Sanction to borrow £27,145 for extension of mains is being sought by the Corporation.

Dewsbury.—LOAN.—The Electricity Committee recommends application for a loan of £4,000 to cover the cost of mains and services for supplying electricity to Savile Town.

Dover.—LOAN SANCTIONED.—Sanction to borrow £1,000 for mains extensions has been accorded the Town Council by the Electricity Commissioners.

Falkirk. — EXTENSIONS APPROVED. — The Electricity Commissioners have sanctioned the carrying-out of extensions to the electricity works. These extensions consist of generating and converting plant and mains.

Grays.—LOAN.—The Urban District Council has applied for a loan of £1,500 for additional plant and mains.

Ilford.—DEFICIENCY.—The Electricity Committee has received a letter from the Ministry of Health, stating that the appeal submitted by the Council against the disallowance of £10,261 8s. 1d., made by the district auditor at his audit of the accounts of the Council for the year ended March 31st, 1919, has been considered by the Minister of Health, and that it appears that the sum in question represents a deficiency on the Council's electrical undertaking at March 31st, 1919; that the Minister is of opinion that the disallowance was lawfully made, and he accordingly confirms the same, but before expressing any opinion as to the steps to be taken in dealing with this deficiency, he desires to be furnished with a report by the Council as to the prospects of its extinction. The Committee instructed the Clerk to inform the Ministry, in reply, that a rate of 5d. in the £ had been made for the ensuing half-year, to meet the deficiency on last year's working.

Leyton.—YEAR'S WORKING.—The gross profit for the year ended March 31st last was £6,000. Of this amount half will be absorbed in payment of interest, and the other half placed to the reserve fund.

London.—BETHNAL GREEN.—The Electricity Committee has recommended the installation of two 500-K.V.A. transformers at an estimated cost of £1,800; switchgear, £600; and the carrying-out of mains extensions at a cost of £7,740.

Morley.—YEAR'S WORKING.—For the year ended March 31st last, the accounts of the electricity undertaking showed a total expenditure of £5,412, and a revenue of £7,883, the gross profit being £2,420. After paying off £2,138 in respect of interest on loans and sinking fund, there was a net profit of £281, as against a deficit of £1,759 in the previous year.

BULK SUPPLY.—The Corporation is considering terms for a supply of electricity in bulk for power purposes, and is in communication with the Electricity Commissioners regarding the matter.

Nottingham.—ELECTRICITY SUPPLY.—A report, which was passed for its first reading, was presented at the last meeting of the Nottingham City Council, dealing with future provision for electricity supply. Mr. J. H. Rider had been engaged by the responsible committee to deal with the question of a modern power station for the Nottingham district, such station to form a part of the general scheme for the East Midlands, and to supply an area extending in all directions beyond the boundary of the city. He has recommended the erection of a new station on the banks of the Trent, the plant installed, in the first instance, to be two 10,000-KW. sets, and future extensions to consist either of 20,000-KW. or 25,000-KW. sets. His estimate of the cost of the complete plant, including land, buildings, machinery, &c., is for the first section of 20,000 KW. installed, £752,000 or £37·63 per KW.; first and second sections for 40,000 KW. installed, £1,009,000 or £25·225 per KW. These figures, which are based upon actual costs at the present time, include a certain amount of expenditure on behalf of the future, viz., the whole of the land, river works for discharge channel, engine and pump cranes, accumulators, &c. The estimate for the first section also includes buildings sufficient for 40,000 KW. of plant. It will also be necessary to provide high-pressure feeder cables between the new power station and the present generating stations in the city at an estimated cost of about £50,000. A certain amount of transformer plant will be required. The economies to be gained by operating the new power station, as compared with the two existing stations, will be very great. The committee proposes that application be made to the Electricity Commission for sanction to the borrowing of £868,000 for carrying out the first portion of the scheme.

YEAR'S WORKING.—The annual report of the Electricity Committee, presented at a recent meeting of the Corporation, showed a surplus of £11,389, compared with a deficit of £8,912 in the preceding year. This is largely due to the increased charges which were put in operation for the last nine months of the period, together with the increase in the number of units sold. The demand is stated to be increasing both for lighting and power purposes, but there has been inevitable delay in making new installations, owing to the lack of necessary materials. The mileage of distributing mains at the end of the year was 72·793. The number of units sold during the year was 17,055,592—an increase of 764,422 for lighting, 624,360 for power, and 1,162,932 for traction.

New Zealand.—EXTENSIONS AT AUCKLAND.—In view of the inadequacy of the present plant, and of the fact that there is no immediate prospect of a hydro-electric supply, the City Council has decided to make large extensions to the electricity undertaking. The scheme adopted will entail an expenditure of £500,000.

WATER POWER.—Three large hydro-electric schemes are under consideration. The Wellington City Council proposes to develop the power of the Orongoronga River at a cost of £337,000, and the Wanganui Borough Council is borrowing £250,000 for the purpose of constructing a hydro-electricity works at the source of the Wangaehu River, about 30 miles from the town. The third scheme is for the development of Lake Monowai to provide power for Southland. The cost of this undertaking will be £1,500,000.

Price Increases.—Consequent upon the recent increase in the price of coal, a large number of undertakings have found it necessary to raise their charges for electricity. Among these are:—Dewsbury, Swansea, Leicester, Barnstaple, Lincoln, Bangor, Darwen, Canterbury, Chester, Crewe, Dover, Maidstone, Motherwell, South Shields and Nottingham. The local company undertakings at Windsor, Sevenoaks and Carshalton have notified their intention to apply for permission to increase their charges.

Digitized by Google

Rotherham.—Strike.—The greater part of the electricity works was shut down on June 3rd, the employés striking in sympathy with the Sheffield workers. The men returned on Sunday, June 6th, and normal conditions were soon resumed.

South Shields.—Loans Sanctioned.—The Electricity Commissioners have agreed to sanction the borrowing of the sum of £31,439 repayable within 20 years.

With regard to a further application for sanction to borrow £37,513 for transformers, mains, sub-stations, &c., the Commissioners authorise the town clerk to let any urgent contracts or accept tenders for the works covered by the application, pending further examination of the figures by the Commissioners.

Turton.—Electricity Supply.—The Urban District Council has had before it a scheme prepared by the Lancashire Electric Power Co. for the extension of the electricity undertaking. This provides for four distinct areas which, whilst complete in themselves, will be linked together. The estimated cost for the four areas is:—Bradshaw, £5,300; Egerton, £6,015; Horrobin £300; and Edgworth, £6,240; a total of £17,855.

The Council has accepted the scheme, and decided to apply to the Electricity Commissioners for power to borrow £20,000.

Wallasey.—Dock Disaster.—Following the Mersey Dock disaster, caused by the breaking down of a dock gate and the release of many thousands of tons of water from the Albert Dock, Birkenhead, the electrical services of the Wallasey Corporation were seriously interfered with at the beginning of the week. The generating station is near the Birkenhead Float, which immediately adjoins the Albert Dock, from which the station obtained its water supply. In consequence of the sudden drop of 8 ft., the water supply was practically cut off. The power supply was considerably reduced, with the result that the electric lighting throughout the town was very poor, and between 40 and 45 tramcars had to be taken off the various services.

Whitchurch (Hants).—Lighting Scheme Abandoned.—Owing to the lack of local support, the scheme to supply the parish with electricity by water power at the Tower Mill has been abandoned.

Wigan.—Year's Working.—A profit of £13,071 was made during the year ended March 31st last, in spite of the fact that prices are much lower than the present average.

Woolston.—Purchase of Station.—The Town Council is considering the purchase of a local electricity undertaking, at a cost of £125,000.

Worthing.—Year's Working.—A surplus of £1,206 was the result of working of the electricity undertaking for the year ended March 31st last, which compares favourably with the deficit of £2,154 on the previous year's working. The capital expenditure upon the electricity works is £100,000, of which £43,000 has been paid off.

Wrexham.—Loan Sanctioned.—The Town Council has been informed that there will be no inquiry with regard to the application for a loan of £17,000 for extensions to the electricity works.

York.—New Plant.—The city electrical engineer has reported as to the cost of purchasing two Diesel engines, and of erecting and putting them in working order, together with foundations, cables, connections and contingencies, the whole amounting to the estimated sum of £18,640. The Electricity Committee recommends that it be authorised to proceed with the necessary purchases and completion of these works, and that application be made to the Electricity Commission for sanction to borrow the requisite amount.

TRAMWAY AND RAILWAY NOTES.

Ashton-under-Lyne. — Fares. — The Tramways Committee has refused to accede to an application from the Hurst Urban District Council to reintroduce penny stages.

Birmingham.—Canal Electrification.—It is reported that electrification of an important part of the canal connecting Birmingham with the Severn at Stourport is to be undertaken shortly. It is calculated that the speed of the barges will be raised to 4½ miles per hour, about double that of horse haulage, and that the method of propulsion will allow of this speed without injury to the canal banks. An overhead trolley wire system is proposed. There is a considerable existing traffic on this portion of the canal, and scope for the development which electrification should render possible.—*Engineering.*

Annual Report.—The Birmingham Tramways Committee has recommended the increase of the existing tramway fares by ½d. to meet the higher cost of administration. It states that it has had under consideration the estimated results of the current year's working of the undertaking, from which it would appear there would be a deficit of £283,537. The latter sum includes the cost of permanent-way renewals estimated at £200,000, which must be carried out during the year to enable the car services on some of the routes in the city to be operated with safety. The deficit could only be met by further increase of tramway fares. The Committee, in its annual statement of expenditure, points out that the amount borrowed for the tramway undertaking is £2,496,464. On the reserve account it is stated that the operating expenses show an increase of £166,091 due chiefly to the enormously increased cost of labour and material, and in a lesser degree to extra mileage—the averege cost per mile being 17·184d., compared with 15·013d. for 1918-19, an increase of 2·171d. per car-mile. The receipts, which constitute a record in the history of the undertaking, amounted to £1,378,704, an increase of £131,433, the net result being, however, a loss of £34,659, as compared with last year's working. By the ½d. increase per fare, it is hoped to raise the additional income required to meet present liabilities. The Committee points out that the tram track has a length of 79 miles, or 123 miles (reduced to single); the traffic revenue last year was £1,371,978; average traffic revenue per car-mile, 21·538d.; and number of car-miles, 15,288,095. The average number of miles per car per day was 82, the average number of car-hours daily 10·92; the number of passengers carried was 225 millions; and the percentage of working expenses to receipts was 79 per cent. In a special report on the subject of fares, the Finance Committee urges that the Tramways Committee might with advantage report to the Council after, say, three months' experience of the proposed new fares in order that the Council might have an opportunity of considering whether the fares were sufficiently increased to cover the rapidly rising working expenses. The loss of the profits of the tramways was in itself a sufficiently serious matter for the Corporation without running the danger of the tramways becoming a charge upon the rates.

Bolton.—Extensions.—The Tramways Committee has under consideration the question of extending its system from the present terminus at Dunscar to a point near the Cross Guns, Egerton, and from the terminus at Tonge Moor along Bradshaw Brow, Lea Gate, to Longsight, Harwood. The Turton Urban District Council has deputed a Sub-Committee to meet the Tramways Committee to discuss the matter.

Bournemouth.—Strike Ended.—Employés who were working upon the tramway track resumed work on June 2nd, after being on strike for a month.

Continental.—France.—The following particulars are gathered by the *Railway Review* from a statement by M. Claveille, Minister of Public Works and Transport:—It being highly important for France to make the most of its water power for generating electricity, particularly at a time when its supplies of coal are not sufficient to meet the needs of its industries, an inventory was made, at the end of 1916, of the available hydraulic power of the public water courses. The Special Committee on railroad service recommended the electrification of 5,220 miles of track as follows: Paris-Orleans, 1,926 miles out of a total of 4,839 miles; Paris-Lyons and Mediterranean, 1,367 miles out of a total of 6,040 miles; Midi, 1,926 miles out of a total of 2,525 miles. With the traffic of 1913, the energy consumption would have reached: Paris-Orleans, 280,000,000 KW.-hours; Paris-Lyons and Mediterranean, 550,000,000 KW.-hours; Midi, 330,000,000 KW.-hours; total, 1,600,000,000 KW.-hours a year. With the estimated traffic in the immediate future, the consumption would be: Paris-Orleans, 560,000,000 KW.-hours; Paris-Lyons and Mediterranean, 1,100,000,000 KW.-hours; Midi, 600,000,000 KW.-hours; total, 2,260,000,000 KW.-hours. In determining upon lines to be electrified, the Midi and the Paris-Orleans considered the relation of the cost of electric power as compared with the cost of power with steam locomotives, and the comparison showed that mountain lines with sufficient traffic should be among the first to be electrified. They also considered the location of the source of hydro-electric energy in relation to the lines, and the importance of this power to other industries. On the Paris-Lyons and Mediterranean, however, the possibility has been considered of using electricity on lines of low grades where there is a heavy traffic, even before mountain lines where the traffic is very small. The proposed sources of electric power are the following: For the Paris-Orleans, the Upper Dordogne river and its branches; for the Midi, the Pyrenees mountains; for the Paris-Lyons and Mediterranean, waterfalls in the central plateau and in the Alps, and the plant at present existing, or about to be constructed, in the region. The probable cost is estimated as follows, based on prices before the war: Paris-Orleans, $94,000,000; Paris-Lyons and Mediterranean, $93,000,000; Midi, $148,000,000; total, $335,000,000.

Austria.—In connection with the projected electrification of that part of the State railway system which is situated in the Alpine districts, it is proposed to extend existing and erect new hydro-electric power stations in different parts of the country, which are to supply 24,000 H.P. The length of the railways to be electrified is about 650 km., and the cost is estimated at 3,560 million crowns, which amount would have to be raised by a loan. According to figures supplied by the Government, the pre-war cost of the proposed works and of the rolling stock required probably would not have exceeded 80 million crowns.—*Financier.*

Hungary.—The State Railway authorities propose to electrify their lines, covering a total of about 1,400 km. This work is to be carried out during a period of nine years. Owing to the fact that all the waterfalls have been lost to Hungary, it will not be possible to utilise hydro-electric power, so other means will have to be used to generate the necessary power.—*Financier.*

Doncaster.—Probable Fare Increase.—The tramway fares in the town and district will shortly be increased in consequence of the heavy costs which have now to be borne in maintenance, wages, &c. The present fares are only 1d., and it is stated that since March last the Corporation has been losing £100 per week on the undertaking. It is probable that new routes will be opened out to the Carr House, Rossington, and Kirk Sandall districts.

Digitized by Google

Exeter.—YEAR'S WORKING.—The total of the traffic receipts for the past year was £31,336, and the expenditure, exclusive of loan interest, &c., was £28,444, leaving a gross profit of £2,892.

Leeds.—FARE INCREASE.—At a recent City Council meeting, it was decided to increase the fares, after the first 1d. stage—which remains as it is—by ½d. per fare. About one-third of the passengers will not be affected by the increase, and about 50 per cent. will have to pay the increase from 1½d. to 2d. A loss of about £300 per day was being incurred, and it is expected that the present deficiency of £100,000 will be liquidated by the advanced fares. The Labour Party put up a strong opposition to the proposal, but their amendment to again refer the matter back for consideration was defeated. The increased charges will come into operation immediately.

Lincoln.—FARE INCREASE.—There was a net profit on the tramway undertaking of £313 on the past year's working. It has been decided to increase the tramway fares from 1½d. to 2d., the 3d. (workmen's four-journey) fares to 4d., and the parcel rates in the same proportion.

Liverpool.—PRICE INCREASE.—The Corporation has decided to increase the basic charge of 1d. per unit for electrical energy supplied to the tramway undertaking by 15 per cent. from June 30th, and a variation for fuel price adjustment is to be added to the increased charges.

London.—HIGH-SPEED CARS.—A new main road from West Ham to Tilbury, to serve the new suburb which the London County Council is erecting at Dagenham, is to have a double tramway track down the centre, fenced off from the rest of the road, to allow the cars to run at high speed.

Manchester.—STAGE REDUCTION.—To meet the anticipated serious deficit on the current year's working of the tramways, the Tramways Committee decided to reduce the 1d. stage in distance from 2 to 1½ miles, and this has been confirmed by the City Council.

Salford.—STAGE REDUCTION.—To meet the increased cost of running the tramways, the Town Council last week decided to reduce the 1d. stage to 1½ miles, instead of 2 miles, as at present. An amendment was proposed to put an extra ½d. on 1d. fares, but was defeated.

Sandwich.—TIME EXTENSION.—The East Kent Light Railway Co. has informed the Town Council that it is applying for an extension of time for the construction of the line from Shepherdswill to Sandwich, *via* Barfrestone, Eythorne, Eastry, Woodnesborough, Ash and Stonar, and the application is to be assented to.

TELEGRAPH AND TELEPHONE NOTES.

Australia.—ARC WIRELESS INSTALLATIONS.—The Minister for the Navy stated that the Naval Board had approved of the installation of the arc system of wireless telegraphy at certain Australian stations. The four installations that had been made were working successfully. The cost of the Melbourne and Perth stations was approximately £890. The Randwick wireless works had made 25 wireless receiving sets at a cost of £110 per set.

Communication with Russia.—The Great Northern Telegraph Co. has been negotiating lately with Litvinoff, over the resumption of telegraphic connection with Russia, which was broken off at the beginning of the war. The company's two cables can quickly be resumed, only the cable between Libau and Petrograd needing repairs.—*Central News.*

Greece.—FOREIGN TELEGRAMS.—The Greek Administration notifies that the English, French, Italian, and German languages are admitted in international telegraphic correspondence until further notice.

High-speed Telegraphy.—A telegram to the Prince of Wales, giving the result of the Derby, was handed in by the King at Epsom at 3.16 p.m. It was transmitted to London, thence to Halifax (Nova Scotia), reaching Canada at 3.19 p.m., crossed the country, and by means of the Imperial Pacific cable the message reached Australia 23 minutes after the finish of the race.

Japan.—TELEPHONE EXTENSIONS.—According to the *Taisho Nichi*, the Japanese Communications Department plans a big extension of the telephone service to be carried into effect during the next eight years beginning with the next fiscal year (from April 1st) at the estimated cost of yen 337,000,000. The present number of subscribers in Tokio is to be increased to 152,000; in Osaka to 91,000; in Kyoto to 30,000; in Yokohama to 21,000; in Kobe to 31,000; in Nagoya to 28,000; and in other places to 327,000. The above figures show the proportion of 49 subscribers per 1,000 population for Tokio; Osaka of 44; Kobe of 43; while others come to a rate of 40 or so. By 1926 Kobe will have six telephone exchanges, including the present three, to deal with the proposed extension. The city of Kobe now contains 9,100 or so subscribers, a number which is to be increased to 31,000. The Communications Department is at present studying the automatic exchange system now in vogue in America and Europe. The present 40 telephone circuits between Osaka and Kobe are to be increased to 100 in some places.—*Economic Review.*

Proposed New Cables.—Various announcements have been made from time to time regarding the laying of new cables, and the following particulars will show that cable factories will be very busy for some time to come:—The Commercial Cable Co. contemplates the laying of another Atlantic cable. Another Atlantic cable is contemplated by the Imperial Government, and one between Scandinavia and America. The Eastern companies are laying cables between England and Gibraltar; Malta and Alexandria; Aden and Bombay; Gibraltar and Malta; Madras and Singapore. A duplication of the British Columbia-Fanning Island cable may also be undertaken. Further cables are to be laid between Miami and Barbados; Barbados and Para; Buenos Aires and Monte-Video; Monte-Video and Santos. The West Coast of South America Co. intends extending its cables northwards; the Commercial Pacific Cable Co. will be duplicating its cables and the South American Cable Co. is establishing landlines between Buenos Aires and Monte-Video, and laying a cable between the latter place and Rio Janeiro. There has also been talk of connecting San Francisco by cable to Central America.

The Times announces that the Pacific Cable Board points out that the duplication of the Vancouver to Norfolk Island cable has not yet been considered by the Governments interested.

Signal Service Vacancies.—The War Office is appealing for a number of wireless operators and wireless electricians for the Signal Service. The normal period of engagement will be for six years with the Colours and six with the Reserve, but ex-soldiers and men who have not been in the Army will be accepted for two, three, or four years. A bounty of £100 will be paid to operators and £50 to electricians who pass the necessary tests.—*Times.*

Spain.—NEW CABLE.—The Government intends, says the *T. and T. Age*, to lay a submarine cable between Cadiz, Spain, and Larache, in Morocco.

Telephone Exchanges.—BUILDING STOPPED.—The Cabinet Sub-Committee on Retrenchment has decided that all buildings for, amongst other things, telephone exchanges, are not to be proceeded with for the present.

Telephones in Rural Districts.—Mr. Illingworth, Postmaster-General, states that during the last 15 months over 500 new telephone call offices have been approved in rural districts, and some of these could be of benefit to farmers.

"I hope," he adds, "that when more progress has been made in overtaking the arrears of work which accumulated during the war, it may be possible more freely to extend the 'phone facilities in rural areas."—*Daily Dispatch.*

Wireless Meteorological Reports.—The Air Ministry states that on and after June 1st meteorological reports for general use will be circulated by wireless telegraphy daily. Synoptic telegrams in the code hitherto used will be issued at 3.15 a.m., 8.45 a.m., and 8.15 p.m. A General Inference, in plain language, based upon the 7 a.m. and 6 p.m. observations, will be issued at 9.15 a.m. and 8 p.m. Call sign G.F.A., wave length 1,400 metres (C.W.). The synoptic telegrams from Aberdeen at 2.30 a.m. and 2.30 p.m. are unaltered. Call sign B.Y.D., wave length 3,300 metres (C.W.). The times given are G.M.T.

Wireless Telephones.—Radio-telephone stations to be used primarily for giving information as to the whereabouts of aircraft travelling, or about to travel, along a route, and for reporting weather conditions along the route to the machine, are being opened in various parts of this country, France, and Belgium. Stations are already open for work at Croydon and Lympne for the London—Paris and London—Brussels routes, and stations will shortly be opened for the London—Birmingham—Manchester—Glasgow route at Castle Bromwich, Didsbury, and Renfrew.

CONTRACTS OPEN AND CLOSED.

(The date given in parentheses at the end of the paragraph indicates the issue of the* ELECTRICAL REVIEW *in which the "Official Notice" appeared.)

OPEN.

Australia.—SYDNEY.—August 4th. N.S.W. Government Railways and Tramways. Two 1,000-KW. sub-station units. Chief Electrical Engineer, 61, Hunter Street, Sydney.

August 3rd. Department of Public Works. Turbines and generators for the Barren Jack hydro-electric development scheme. Department of Public Works, Sydney.

N.S.W.—Postmaster-General's Department. August 2nd and 5th. Aluminium sheet, brass rod, &c., scheduled 769; platinum wire, gold and silver wire, scheduled 768. (See this issue.)

WESTERN AUSTRALIA.—Postmaster-General's Department. August 3rd. 326 accumulators, schedule 668. (See this issue.)

Barnsley.—Electric light installation at Westgate Primitive Methodist Church. Mr. P. Pickersgill, 122, Dodworth Road.

Belgium.—June 23rd. The Société Nationale des Chemins de Fer Vicinaux, 48, Rue Monteyer, Brussels. Tenders for about 3,400 metres of underground armoured feeders for the electric railways in the Namur district. Particulars from the Services Electriques Department, at the address given above.

Bedford.—June 21st. Electricity Department. One 2-ton locomotive jib crane, with grab and track rails, steam and other pipework. (June 4th.)

Johnson & Phillips, Ltd. ..	27,260	"	52 "

Cable Ducts.—Reference to the tender of Messrs. Sankey & Co. for cable ducts, accepted by the Council on April 28th. The firm notify that an award of the Industrial Reconstruction Committee for the clay industries has advanced the wages of the men by 8s. per week, and that this will increase the estimate by £153. As a stipulation was made in the company's tender providing for increased prices, the Committee has agreed to accept the revised offer.

Cable.—1,000 yards '1 L.T. concentric cable, £358; 500 yards '2 L.T. ditto, £304:—

Western Electric Co., Ltd., accepted.

Kingston-on-Thames.—Education Committee:

Electric light installation, manual training centre.—H. Offer.

Liverpool.—Corporation. Metropolitan-Vickers Electric Co., Ltd.—Switchgear, &c., in connection with the new 12,500-KW. generating set for the Lister Drive power station.

The Corporation has rescinded the acceptance of the tender of the Edison Swan Electric Co., Ltd., for the supply of insulated cables and wires for the 12 months ending March 31st next, and has accepted that of the Liverpool Electric Cable Co., Ltd.

London.—ST. MARYLEBONE.—Electricity Supply Committee recommended four 35-H.P. slow-speed motors and switchgear for the cooling-tower fans.

W. Hallen, Son & Co. (recommended) ..	**£2,763**	delivery 7 to 8 months.	
British Thomson-Houston Co., Ltd. ..	2,793	"	8 "
English Electric Co., Ltd.	3,116	"	12 to 14 "
Metropolitan-Vickers Electrical Co., Ltd.	3,914	"	10 "

Two turbine-driven rotary pumps, capacity 15,000 gallons per hour: £1,179, Messrs. Weir (recommended).

Circulating water pipes and valves: Aiton & Co., £1,856 (recommended).

Cables for generator and rotary converters:

British Insulated and Helsby Cables, Ltd. (recommended)	**£2,779**
Western Electric Co., Ltd	2,953
Callender's Cable and Construction Co., Ltd.	3,039
Pirelli-General Cable Works, Ltd.	3,152

House-service Meters.—The Committee recommends that the Council enter into contracts with Messrs. Chamberlain & Hookham, Ltd., and Ferranti, Ltd., for an indefinite number of meters, on the basis of their second alternative offer, for a period of one year.

General Purposes Committee. Set of Magneta electric clocks for the Town Hall, including master clock, 39 secondary wall clocks, and nine secondary mantlepiece clocks, &c.: £357, Magneta Time Co., Ltd. (recommended).

Motherwell.—Town Council:

Electricity meters for a year.—Chamberlain & Hookham, Ltd.

Poplar.—Borough Council:

Electric light installation, 144 houses.—Farndons Electric Co.

South Africa. — STRAND (CAPE PROVINCE). — Electric lighting for the municipality, Hubert Davies & Co., Ltd.
OUDTSHOORN (CAPE PROVINCE).—Hubert Davies & Co., Ltd., for the supply of the additional generating plant.

Digitized by Google

FORTHCOMING EVENTS.

Physical Society of London. — Friday, June 11th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary meeting.

Faraday Society.—Monday, June 14th. At Burlington House, Piccadilly, W. At 8 p.m. Ordinary scientific meeting.

Society of Engineers.—Monday, June 14th. At Burlington House, Piccadilly, W. At 5.30 p.m. Lecture on "Great Engineering Adventures," by Mr. E. Cressy.

Institution of Electrical Engineers — Wednesday, June 16th. At the Institution of Civil Engineers, Gt. George Street, S.W. At 6 p.m. Discussion on the following: Paper read by Sir Dugald Clerk, F.R.S., before the Royal Society of Arts, on "Distribution of Heat, Light and Motive Power by Gas and Electricity"; and on "The Report of the Coal-Gas and Electrical Supply Industries of the U.K. to the President of the Institution of Gas Engineers," by Sir Dugald Clerk, F.R.S., Prof. A. Smithells, F.R.S., and Prof. J. W. Cobb.

NOTES.

Inquiry.—Agents for the "Edel" electric iron are asked for.

Appointments Vacant.—Lecturer in electrical wiring, for L.C.C. Hackney Institute; armature winder, for the Rochdale Corporation Tramways; electrical engineer (£1,000), for the Southampton Corporation; head of mining department (£375), head of engineering department (£375), for the St. Helens Municipal Technical School; electrical engineer ($10,200; the Straits dollar is fixed at 2s. 4d.), for the George Town (Penang) Municipal Commissioners; two cable foremen (550 rupees per calendar month), for the Telegraph Department of the Government of India; shift engineer (94s. 2d.), for the Rawtenstall Corporation Electricity Department; mains assistant, for the Sale Urban District Council Electricity Department: assistant mains engineer (£290), shift charge engineer (£276), for the Walsall Borough Electricity Supply Department; lecturers in physics, electrical and mechanical engineering for the Birmingham Municipal Technical School. See our advertisement pages for particulars.

Educational. — Imperial College of Science and Technology.—On Friday last a public meeting was held at the Central Hall, Westminster, in support of the claim of the College to be invested with the power to confer degrees. Lord Morris presided, and amongst the speakers were Prof. Watts, Mr. H. G. Wells, Sir Ernest Rutherford, Mr. J. A. Spender, and Sir Alfred Keogh. The great majority of the large audience consisted of students of the Imperial College. A resolution urging the Prime Minister and educational departments to consider the matter seriously was moved from the chair, Lord Morris adding that if their aim was not accomplished in the regular way, there was another way to attain it. The resolution was carried, with one dissentient.

Cambridge University.—The Commercial Union Assurance Co. has presented a sum of £165,000 to build and endow a laboratory for research in biochemistry.

Electricity in Steel Making.—At a meeting of the London Section of the Igranic Engineering Society on June 2nd, an interesting lecture on "Our Part in Steel Making" was delivered by Mr. C. W. Yerger, M.A.I.E.E. The lecture covered a great deal of ground, the industry being traced from the coal and iron mines and limestone quarries to the finished products of a variety of descriptions. Dealing with the mines, the lecturer enumerated the many ways in which electricity entered into the working and described hoists, air compressors, pumps, locomotives, &c. The coke ovens then received attention, and many facts concerning belt conveyors, cranes, breakers, crushers, door-operating gear and other plant were presented to the audience, and by means of lantern slides, members were enabled to obtain a good idea of the ingenuity of the machinery. The electrical plant utilised in the blast-furnace process was given a good deal of time, and some excellent photographs of car conveyors for delivering the iron, coke, &c., at the furnace top were exhibited. Methods of using the blast-furnace gas were detailed, part being used for heating purposes, and part for the generation of electricity. The steel works and rolling mills with their powerful motors and generators were illustrated and described. Special attention was accorded the electric cranes, and the magnetic braking devices for operating upon any failure of power were exhaustively dealt with, much interest being evinced in the arrangement by which a torque motor connected in parallel with the main motor, operating a cam gear acts against a spring while in motion, releasing this to operate the brakes when the power is cut off.

Fatalities.—The Deputy-Coroner for Newcastle-on-Tyne inquired, on June 2nd, into the death of two men, which occurred while they were working on the mains of the Newcastle and District Electric Lighting Co., Ltd. The two victims were Thomas Farrer, a foreman jointer, and Murray Kennedy, an assistant foreman. George Carr, mains superintendent to the company, said on May 29th a complaint was received from a picture hall in Scotswood Road that they could get no light. Upon an inspection of the mains, witness found that the fault was in a pipe at the junction-box at the top of Forth Banks. A short circuit had been set up on a Scotswood Road cable, which had set fire to other cables. The junction-box contained eight pairs of cables. The circuits were disconnected at the sub-station, and left till Sunday, when repair-work was recommenced. Seven pairs of cables were discovered to have been burned through in the pipe, some 2 to 4 ft. from the box. One cable was intact. In order to identify the cables, the whole were pulled out and labelled. After testing the cables to see they were otherwise all right, it was decided to rejoin those cables necessary to get the current on to supply places of worship with light, and leave the Scotswood cable till last. At 5.30, five pairs of cables were jointed, and it was decided to put the current on. Before doing so, witness read to Farrer a list he had received from Mr. Cowe, the foreman in charge of the jointing. That was done in Mr. Cowe's presence, and witness asked if it were correct. The reply was in the affirmative. Witness then went to the power station and gave the list to the station engineer; proceeding thence to the sub-station, the switches were put in. In a few minutes a telephone message was received, asking that the circuits should be made dead. On examining the cables afterwards, witness found that the Scotswood B cable was fully jointed, but the Westgate B cable was only partly jointed, and he found that the two men had been working on the Westgate B when the current had been turned on. It was evident that the deceased must have made a mistake, and connected Scotswood B. instead of Westgate B, and given Westgate B as a finished circuit. R. T. Cowe, foreman cable layer, spoke to receiving the names of the finished cables from Farrer. After the accident he pulled Kennedy off the wire. Farrer had evidently made a mistake between the two cables. Witness did not check the cables, but accepted Farrer's word. A verdict of "Accidental death" was returned, and the Coroner expressed the opinion that Farrer had made a mistake.

Whilst following his employment as a colliery mechanic at Lord Ellesmere's No. 2 Mosley Common Pit, near Walkden, on June 3rd, Thomas Crook (35) was killed. He was seen to open a switchbox, although he had been warned not long before not to go near it, and had no business with it whatever. A lad named John Ivill, on going to him shortly afterwards, could get no reply from him, and he was found to be dead. The current was shut off, and the body removed.

Electric Vehicles for Invalids.—Mr. Granville Bradshaw, of A.B.C. Motors, Ltd., Walton-on-Thames, who was responsible for the A.B.C. aircraft engine, &c., has designed an electrical vehicle for the use of invalids. The machine, which has already undergone preliminary tests, consists practically of a motor-cycle side-car body on four wheels. A single electric motor drives the rear axle by chain, and a battery is carried having capacity for a distance of 35 miles on one charge. It is stated that simplicity is the keynote of the machine, which is so arranged that it can be controlled either entirely by hand or entirely by foot, or by any suitable compromise between these two methods.

Power Without Fuel.—According to a statement communicated to the International Press Service by Mr. Tom Emery, within a few weeks the public will see his invention in operation; it is described as an automatic, self-starting, self-stopping motor, which generates power without fuel "by an application of hitherto unexplored principles of mechanics." It is going to put the thermal engine out of commission, he says, and can drive anything from a watch to a super-Dreadnought. Strange to say, when the inventor advertised inviting applications for licences to manufacture his motors, only a few replies were received; so he has transferred all his rights to a limited company. The use of fuel being abolished, the cost of living is to be enormously reduced, the atmosphere of cities will be purified, the population will be diffused, and the National Debt will cease to be a burden. With wages high and working hours low, Bolshevism will be struck a mortal blow. There is nothing new under the sun, said the Preacher, and this epoch-making device is a familiar phenomenon to us. That Mr. Emery is an inventor is not open to question; and his description of the Emery motor is strictly accurate, in one respect. He says it is self-stopping.

Birmingham Electric Supply Department. — War Memorial.—The employés of the Birmingham Electric Supply Department have subscribed for and erected a memorial to their 31 colleagues who gave their lives in the war. It takes the form of a bronze tablet placed in the entrance hall to the offices in Dale End. It is a very artistic production. Surmounted by the City Arms, worked in enamel, it bears the following inscription on its centre panel:—

"This tablet was erected by the employés of this Department to perpetuate the glorious memory of their Colleagues who fell in the great war, 1914-1919."

Two side panels give a record of the names of the 31 employés who made the supreme sacrifice. Last Saturday afternoon, in the presence of a company representative of all sections of the department, the memorial tablet was unveiled by Mr. R. A. Chattock, the city electrical engineer. As befitted the occasion, which coincided with the fourth anniversary of Kitchener's death, the ceremony was a simple one, not unmingled with touches of emotion. After the unveiling, a few words from Mr. Councillor Beale, chairman of the Electric Supply Committee, and Mr. Jennings, secretary, brought the proceedings to a close. It has been arranged for photographic copies of the memorial to be sent to the relatives of the men whose names it bears.

Accident.—At the Oldham Corporation electricity works, last week, William Humphries, turbine driver, somehow touched one of the isolator switches and received a shock at 6,000 volts. He was rendered unconscious, but artificial respiration was resorted to, and after an hour-and-a-half the man was brought round. In a few hours Humphries had fully recovered his faculties. In such cases artificial respiration should be continued, if necessary, for three hours.

The Gas Regulation Bill.—*The Board of Trade Journal* gives a résumé of the objects of this measure.

It is proposed to provide:—

1. That charges for gas shall be based upon the number of heat units supplied to the consumer instead of upon the number of cubic feet of gas supplied as at present.

2. For the necessary adjustment of standard and maximum prices and sliding scale provisions, and for an addition to the price to compensate for the increased cost of production and supply of gas.

3. For the more efficient testing of the gas; and

4. For facilities for the obtaining by gas undertakers of further powers without direct recourse to Parliament.

In effect, the Bill is one for the reconstruction of the gas industry and the adjustment of the statutory obligations imposed upon the industry with regard to the quality and price of gas in the light of modern requirements. The Fuel Research Board in a report dated January 29th, 1919 (Cmd. 108), recommended as a central principle that the existing system of charging the consumer for the volume of gas of a certain nominal illuminating or calorific value which passes through his meter, should be replaced by one in which he is charged directly for the potential thermal units he receives. The alteration in the system of charging necessitates a more efficient system of testing the gas, and the Bill, while allowing gas undertakers to supply gas of any calorific value, which they declare that they propose to supply, makes provision for the extension of the functions of the gas referees and of the chief gas examiner, which are at present confined to London, to the whole country, so that testing everywhere will in future be carried out according to their directions. It is proposed in Clause I to give the Board of Trade power to make departmental orders under which effect will be given to the principles of the Bill in accordance with the conditions of the individual undertakings.

The second clause contains the statutory requirements with which undertakers, who have obtained orders from the Board of Trade, will have to comply with regard to the composition and pressure of the gas supplied by them. Power is taken if necessary to impose a limitation on the proportion of inert constituents of the gas, but an important protection of the consumer against an excessive proportion of such constituents will lie in the fact that under the new system of charging by heat value he will not have to pay for them.

A restriction on the proportion of carbon monoxide in the gas has been advocated in the interests of public health by the Fuel Economy Committee of the British Association. The Bill places an obligation on the Board of Trade to cause an inquiry to be held into this question, and if as a result of the inquiry any such restriction is found to be desirable the Board will be authorised to make a special order relating to the matter.

It is intended under the Bill that the additional costs of production and supply shall be allowed for with a view to enabling undertakings as a general rule to earn approximately their pre-war rate of profit.

The costs of administering the Act are proposed to be met by the formation of a gas fund for which a levy not exceeding £15 for each 100,000,000 cu. ft. of gas is to be made; that is to say, not more than one penny for every 14,000 cu. ft. of gas. Undertakings making less than 100,000,000 cu. ft. in the year will not be required to contribute.

Concrete Pipe Manufacture.—The May *Journal* of the S.A. Institution of Electrical Engineers contains a paper upon the manufacture of concrete pipes by the Hume centrifugal process (Hume Pipe Co. (S.A.), Ltd.). The materials employed are crushed stone from the mines in the Witwatersrand area, cement from the Pretoria Portland Cement Co., and, for reinforcement, discarded winding ropes, of which large quantities are available. The ropes are cut into suitable lengths, annealed, and then unstranded. They are then woven into cages which are placed in the pipe moulds. The latter are made of light galvanised steel sheet with cast-iron end rings, which serve a treble purpose, securing the steel casing, forming the thickness of the pipe, and providing the running treads which come into contact with the revolving disks of the moulding machine. These machines are of simple design operated by variable speed motors or long cone pulleys. The moulds are placed on the machine and rotated slowly. The concrete is thrown into the moulds until the required amount is furnished, the machine is gradually speeded up, and the centrifugal force causes the material to be evenly distributed throughout the length of the moulds; water is also driven out by this method. If an exceptionally smooth internal surface is desired, a polishing bar of steel pipe is firmly applied to the surface of the concrete. The lengths of the pipes are usually as follows: Up to 15 in. diameter, 6 ft., and from 18 to 72 in. in diameter, 8 ft. Six 4 or 6-in. diameter pipes can be completed in eight or nine minutes, and four 15 or 18-in. pipes in fifteen minutes. Larger sizes up to 60 in. diameter can be finished in about twenty minutes. The joints are made by slipping a collar of the same material over the pipes, and packing with a sand and cement mixture for low pressures or a special plastic mixture for high pressures. Sizes up to 9 in. diameter will withstand a working pressure of from 300 to 350 lb. per sq. in., while larger sizes have been tested up to 210 lb. per sq. in.

Industrial League Convention.—The Industrial League and Council is organising a convention of employers and employes to be held on Tuesday and Wednesday next, 15th and 16th inst., in Manchester. We understand that the Manchester Engineering Council is cordially co-operating with the representatives of the League in the district in making the necessary arrangements. The Conference will be held in the Town Hall.

Registration of Engineers.—The May issue of the *Journal of the Engineering Institute of Canada* gives the texts of the professional engineering Acts that have become law in British Columbia and Manitoba to incorporate the associations of professional engineers. In New Brunswick and Nova Scotia it is expected that during the present sessions of the Legislative Assembly other Acts will have been passed, and the Alberta Act has been passed recently. In Quebec there has been established the Corporation of Professional Engineers. In Ontario the formulation of an acceptable Bill is in the hands of an Advisory Conference Committee established by the suggestion of the Ontario Provincial Division. In Saskatchewan changes were suggested by the Premier which caused the Bill to be withdrawn. In the Bills that have become law "professional engineer" means any person registered as a professional engineer under the provisions of the Act; "professional engineering" or "the practice of a professional engineer" embraces the designing, supervision, the advising on the design, or supervision and the advising on the making of measurements for the construction, enlargement, alteration, improvement, maintenance, or valuation of public or private utilities, industrial work, railways, bridges, tunnels, highways, roads, canals, harbour works, harbours, river improvements, lighthouses, wet docks, dry docks, floating docks, dredges, cranes, and other similar work, steam engines, turbines, pumps, internal combustion engines, and other similar mechanical structures, airships and aeroplanes, electrical machinery and apparatus, chemical and metallurgical machinery, and works for the development, transmission, or application of power, mining operations, and apparatus for carrying out such operations, municipal works, irrigation works, water works, water purification plants, sewerage works, sewage disposal works, drainage works, incinerators, hydraulic works, and all other engineering works. The execution by a contractor or his assistants of work designed by a professional engineer, or the direction of work as otherwise defined in this clause by superintendent of construction, or superintendent of maintenance, or their subordinates when working from designs or upon advice of a professional engineer, shall not be deemed to be the practice of professional engineering within the meaning of this Act.

In the U.S.A. a committee has reported to the Society of Civil Engineers on the advisability of legislation providing for the registration of licensing of practitioners of professional engineering, architecture, and land surveying, and has recommended a uniform registration law. The report states that in fixing the qualifications for registration these were purposely made high, but they have not been made unnecessarily difficult for reasonably competent men to meet. It is not intended that candidates would ordinarily be subjected to written examinations, but rather that the board of registration would pass upon the sufficiency of the professional record of each candidate. Minimum qualifications have been provided. In order to enable the board to pass upon candidates fairly certain qualifications are specified as, *prima facie*, evidence of fitness, which (unless other facts derogatory to a candidate are also in evidence) will permit the board to pass the candidate. The principal qualifications are: Long continued practice, graduation from a technical school of approved standing, with subsequent years of practice or membership in high-grade technical societies, in the absence of disqualifying facts.

Electrical Pumping in the U.S.A.—During the winter and spring of 1918-19, according to the *Engineering World*, 97 of the 206 public water works systems in Indiana were visited by members of the engineering experiment station staff of Purdue University, with a view to ascertaining the present status of electrical operation of such plant. Among the conclusions given are: (3) The energy consumption in properly designed plant may be expected to vary from 0.2 to 2.0 kw.-hours per 1,000 gal. per 100 ft. head, with 1.0 as a fair average. (4) The operating expenses for an electrically operated plant are low—considerably below those for a steam plant and appreciably below those for an internal combustion engine plant. —*Technical Review.*

U.S.A. National Electrical Code Revision.—The National Electrical Code was first promulgated 23 years ago, and has grown until to-day its rules are not much short of absolute law. The committee that revises the code includes representatives of the National Electric Light Association, American Institute of Electrical Engineers, American Electric Railway Association, National Electric Contractors' Association, U.S.A. Bureau of Standards, besides representatives of national and municipal bodies interested in fire prevention and underwriters' organisations. In March last, at New York City, the Electrical Committee of the National Fire Prevention Association held a public meeting on the recommended changes in the code. After the public hearing the committee held a closed meeting, at which the recommended changes were adopted with some few exceptions.

INSTITUTION NOTES.

South African Institution of Engineers.—The May *Journal* gives further and more complete details of the scheme for providing a meeting place for the South African technical and scientific institutions and societies. The Institution will be known as the "Associated Scientific and Technical Societies of South Africa." The Institute of Engineers is contributing £500 from its funds, and the members are endeavouring to raise at least another £2,000 towards the cost of the scheme. The purchase of the Johannesburg Club will cost £22,500, and the Chamber of Mines has agreed to contribute 10s. for every £1 subscribed up to a total of £5,000, and also to meet interest charges on mortgages for the first two years.

South African Association of Municipal Electrical Engineers.—According to *Engineering in South Africa*, the Annual Convention will be held this year during the week September 13th to 18th at Pretoria, where Mr. T. C. Wolley-Dod, town electrical engineer, will act as President. Provisional promises for papers have been received from Mr. A. E. Val Davies, of Cape Town, Mr. Mordy Lambe, of East London, and Mr. G. Mercier, of Bethel.

Since the last Convention, says our contemporary, the Association has suffered the loss of a number of prominent members, amongst whom may be mentioned Col. Dobson, D.S.O., Johannesburg (Past President), Mr. D. A. Stewart, Bloemfontein (Member of Council), Mr. W. Bellad Ellis, Queenstown (Member of Council), and Mr. E. T. Price, Johannesburg (Member of Council), and their places will be hard to fill.

"Most of these past members are making the change from municipal to commercial life, and it would appear that the municipalities to-day have not a sufficient appreciation of the opportunities offering to technical men of initiative and experience, or else on the other hand, there must be a feeling that the restrictions and vexations of municipal work put too great a curb on their energies and ambition."

S.A. Institute of Electrical Engineers.—In the course of a discussion, on April 22nd, on the use of electricity in developing the resources of the Union, Mr. J. W. Kirkland, past president, referring to the use of electricity in connection with agriculture, said that he believed that the time of the dark farm, when the farmer and his wife got up in the dark of the morning to milk their cows, and went to bed by candle light, had passed, and that electricity was going to change farming into a more normal kind of life. It could only be done by electricity. The farming population would increase their happiness and increase the output of the farms by electricity; having learned the advantages of electricity by reason of the electric light, they would then find the other advantages of using electric power.

Mr. C. J. M. Constancon said that before the war a director of a large German electrical manufacturing firm told him that in Germany agricultural progress was principally due to the adoption of modern and scientific methods, and that electricity had made in this direction a great stride forward. He pointed out that one of their big items of manufacture came under the heading of electrical material for agriculture, such as motors, high-tension sets for electroculture, and special types of tractor sets. He also said that for certain types of cultivation, electricity had been extensively employed; that meant that bad soil had been greatly improved. Another great factor which showed in what measure electricity was used for agriculture, was the great system of generating stations which had been erected all over the country, and was known as the overland centrals. Mr. Constancon had also visited one of the large estates in Silesia, and was surprised to see what they were doing by means of electricity. Electrical ploughing was going on night and day, and most of the work, such as the milking of the cows, the pumping, milling, cutting, and pressing was all done by electricity. There was a great future for electricity in connection with agriculture, and especially for those farms which were near large generating stations.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Captain H. L. DIXON, late R.A.F., has resigned his position as chief engineer and manager to the Leatherhead & District Electricity Co., Ltd., held since 1906, to take up private work.

Watford U.D.C. has granted the following increases of salary: Chief electrical engineer, from £650 to £800; chief assistant and station superintendent (Mr. C. E. GREENHALGH), from £384 to £602 10s. (graded as power station superintendent); mains superintendent (Mr. J. E. Wallers), from £342 to £538.

Mr. A. S. HOOPPELL, late junior assistant engineer at the Southend-on-Sea Corporation power station, has been appointed a charge engineer at the Torquay Corporation works.

Mr. L. OSTICK, mains assistant at the Bridlington electricity works, has been appointed to a similar position with the Finchley Council.

Dover T.C. has appointed Mr. E. L. SHOESMITH charge engineer, at a salary of £200 a year, to be reviewed at the end of three months.

Mr. R. L. HORSFIELD, manager of the Walsall Corporation Tramways, who is leaving for a similar appointment at Cardiff, has been presented by the staff with an inscribed oak bureau bookcase.

The salary of Mr. WISHART, electrical engineer at Motherwell, is to be increased by £100 to £550 per annum. The A.M.E.E. requested the payment of £773, with £60 bonus, plus 30 per cent.

The American Academy of Arts and Sciences has awarded the Rumford Premium to Dr. IRVING LANGMUIR, for his researches in thermionic and allied phenomena.

The Willard Gibbs medal has been presented to Dr. F. G. COTTRELL, director of the U.S. Bureau of Mines, by the Chicago Section of the American Chemical Society in recognition of his researches on the precipitation of fumes and dust.

Bath City Council has increased the salary of Mr. F. TEAGUE, the City Electrical Engineer, from £700 to £850 per annum.

The Birthday Honours List.—In the list of Birthday Honours, which was published on Saturday last, the following gentlemen are awarded the honour of knighthood:—

Mr. Philip Dawson, for service rendered as a member of the Disposal Board, Ministry of Munitions.

Mr. William Noble, chief engineer to the General Post Office.

Professor J. B. Henderson, D.Sc., Professor of Applied Mechanics, R.N. College, Greenwich.

The ELECTRICAL REVIEW tenders its congratulations to these three gentlemen.

Obituary.—MR. O. V. THOMAS.—We regret to read in the *Times* of the death which occurred on May 30th, at Marseilles, from pneumonia, of Mr. Orlo Venning Thomas, Municipal electrical engineer, Penang, late P.W.D., Straits Settlements, age 51.

PROF. AUGUSTO RIGHI.—The *Times* correspondent at Milan reports that Prof. Augusto Righi, who held the Chair of Physics at Bologna University and was well known for his experiments in magnetism and electricity and light, died at Bologna on Tuesday at the age of 70 years.

NEW COMPANIES REGISTERED.

W. Canning & Co., Ltd. (167,927).—Public company. Registered June 1st. Capital, £450,000 in £1 shares. The objects are: To carry on the business of manufacturers of and dealers in polishing and plating plant, machinery, apparatus, and materials and preparations for the businesses of electro platers, polishers, electro depositors, enamellers, and lacquerers, metallurgical chemists and analysts, drysalters, electrical and general engineers, &c., and to adopt an agreement with E. R. Canning. The first directors are: E. R. Canning, Grey House, Hamstead Hall Road, Handsworth, Birmingham; T. R. Canning, The Tan House, Lapworth, Warwick; A. B. Canning, 5, Park Avenue, Handsworth, Birmingham; E. Williams, Benson Works, Foundry Lane, Birmingham; G. A. Pope, Southam Road, Hall Green, Birmingham. Solicitor: E. P. Beale, 12, Newhall Street, Birmingham. Registered office: 137, Great Hampton Street, Birmingham.

Vickers-British East Africa, Ltd. (188,013).—Private company. Registered June 4th. Capital, £2,000 in £1 shares. To carry on the business of manufacturers of and dealers in steel, iron, brass, and metals, shipbuilders, shipwrights, ordnance manufacturers, electricians, &c. The first directors are: Sir Francis Barker, Lowndes House, Lowndes Square, S.W.; S. V. Dardier, 48, Grange Road, Ealing, W.; N. Robinson, Westmoor, Green House, Slough (all of various other companies). Solicitors: Linklater and Paines, 2, Bond Court, Walbrook, E.C. Registered office: Vickers House, Broadway, Westminster.

Uno Co., Ltd. (167,790).—Private company. Registered May 27th. Capital, £5,000 in £1 shares. To carry on the business of electrical and general engineers, manufacturers of the "Uno" roaster, &c. The first directors are: P. B. Benkert, 159, Venner Road, Sydenham, S.E.; W. Bennett, 28, Amhurst Park, Stamford Hill, N.; C. P. Bennett, 28, Amhurst Park, Stamford Hill, N. Solicitor: W. N. Wyles, 4, Walbrook, E.C. Registered office: 90, Minories, Tower Hill, E. 1.

Hays, Standen & Co., Ltd. (167,869).—Registered May 31st. Capital, £50,000 in £1 shares. To take over the business of engineers, merchants and manufacturers carried on at 71, Southwark Street, S.E., as "Hays, Hunter & Standen, Ltd.," and to carry on the same and the business of dealers in machinery and plant, castings for electrical, motor, and allied industries, switches, lamp holders, &c. The first directors are: J. D. Garrett, 88, Ebury Street, S.W.; P. J. Hays, Bleangate, Purley, Surrey; H. W. Standen, Canterbury House, Sevenoaks. Solicitor: T. W. Hall, 61, West Smithfield, E.C. Registered office: 71, Southwark Street, S.E.

City Electric Welding Co. (Newcastle), Ltd. (167,863).—Private company. Registered May 31st. Capital, £5,000 in £1 shares. To carry on the business of electric and oxy-acetylene welders, automobile engineers, agents for motor lorries, cars, cycles, scooters, and motor and aeroplane accessories, marine engineers, ship builders and repairers, &c. The first directors are: A. Atkinson, 1, Lesbury Road, Newcastle-on-Tyne; W. C. Waller, Elderhurst, Granville Road, Newcastle-on-Tyne; C. Deuchar, Overdale, Lindisfarne Road, Newcastle-on-Tyne. Secretary: W. C. Waller. Registered office: 2 and 4, Stephen Street, Bridge End, Byker, Newcastle-on-Tyne.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Crampton & Co., Ltd. (109,328).—Capital, £2,500 in £1 shares. Return dated April 8th, 1920. All shares taken up and paid for in full. Mortgages and charges nil.

Lymington Electric Light & Power Co., Ltd. (57,985).—Capital, £30,000 in £5 shares (4,600 ordinary and 1,400 preferred). Return dated March 31st, 1920. 3,588 ordinary and 1,285 preferred shares taken up. £24,375 paid, including £10 on shares forfeited. Mortgages and charges, £9,000.

Digitized by Google

Crossley Bros., Ltd. (51,970).—Return dated May 9th, 1920. Capital, £2,000,000 in £1 shares (403,390 preferred, 1,015,414 ordinary, and 581,196 unissued). All preferred and ordinary shares taken up. £533,200 paid. £885,604 considered as paid. Mortgages and charges, nil.

Chas W. Webber, Ltd.—Debentures dated May 17th, 1920, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: F. E. Dove, Chandos Lodge, Weston-super-Mare.

British Union Lamp Works, Ltd.—Particulars of £20,000 debentures authorised May 20th, 1920; whole amount issued. Property charged: The company's undertaking and property, present and future, including uncalled capital, subject to £10,000 first mortgage debentures. No trustees.

Sutton-in-Ashfield Motor & Electrical Engineering Co., Ltd.—Debentures charged on certain land and premises in Sutton-in-Ashfield, and the company's undertaking and property, present and future, including uncalled capital, dated May 14th, 1920 to secure all moneys due or to become due from the company to London County Westminster and Parr's Bank, Ltd.

Lighting & General Traders, Ltd.—Satisfaction in full on April 14th, 1920, of debentures dated November 6th, 1919, securing £682 10s.

Whitchurch & Pangbourne Electric Supply Co., Ltd.—Satisfaction in full on April 29th, 1920, of charge dated August 14th, 1919, securing £300.

CITY NOTES.

United River Plate Telephone Co., Ltd.

The gross earnings for the year 1919 were £976,168, and the gross maintenance and other charges in Argentina and London were £764,076, leaving £212,092, from which debenture interest and preference dividend are deducted; 8 per cent., free of tax, is paid on the ordinary shares; £50,000 is put to reserve; £10,000 to reserve (war contingencies) fund; £35,700 is carried forward, as against £36,707 brought in. The directors have sanctioned the introduction into Buenos Aires of the automatic system. The shareholders are to be asked to authorise the increase of the capital to £2,500,000, with power to the directors to issue new shares at such times and upon such terms and conditions as they shall determine, as the general expansion of the undertaking of the company and the necessity of coping with the ever-increasing demand for new telephone facilities entail an outlay which can only be met by the provision of additional capital.

Callender's Cable and Construction Co., Ltd.

The report for 1919 shows a balance to the credit of profit and loss account of £161,525. Debenture interest absorbs £13,500; preference dividend £26,000; depreciation of buildings, plant, and machinery £37,500; depreciation of office furniture £500. The balance brought forward was £114,779, and the available balance is £198,803; 15 per cent., less income tax, on the ordinary shares requires £60,000; there is put to special reserve for war taxation £33,000, and carried forward £105,803. During the year an entire change has taken place in the business of the company, as the factories both at Erith and of the Anchor Co. at Leigh, have been converted from manufacturing war materials to ordinary commercial production. This conversion has involved much work, and has taken considerable time. During that period output was seriously interfered with, but the change-over is now complete, with most satisfactory results. The urgent necessity to increase the company's production, notwithstanding the working week being reduced to 47 hours, required a reorganisation of the factory conditions, and, after lengthy negotiation, a system of continuous working by three rotary shifts was established, with the result that output has now been substantially increased. In the early part of the year it became evident to the directors that additional plant and machinery were required to meet the increasing demands of the industry for cables capable of working at much higher voltages than in the past. Extensive new workshops were therefore erected for the manufacture of super tension mains of 33,000 volts and upwards, and these are now practically completed. The Picardy works, which were specially erected and equipped with machinery for the rapid manufacture of field telephone cables for the army, have been completely converted and re-equipped with plant for the manufacture of telephone cables for general use. The financial results of 1919 are regarded as eminently satisfactory, especially when consideration is given to the difficulties inseparable from the great change-over which has occurred, and the general reorganisation of industry. They believe that the full results of the new plant will only be apparent in the future, and, seeing that the volume of orders obtained is exceptionally large, they have every hope that the financial results of the current year will be even more favourable. The business of the Anchor Cable Co., Ltd., a subsidiary of this company, suffered from the process of conversion referred to above, but, nevertheless, the financial results have been satisfactory. An excellent feeling prevails between the operatives and the management. As the financial resources of the company, even with the additional capital issued in 1918, have not sufficiently met the requirements of the company's increasing trade, the directors, early in April last, took the necessary steps to increase the capital by the creation of 400,000 "B" cumulative preference shares of £1 each; these will be issued shortly and, with them, the unissued balance of 100,000 ordinary shares.

Marconi International Marine Communication Co., Ltd.

The report for 1919 states that the business continues to show substantial expansion. Gross revenue £772,019, an increase of £208,813 over 1918. This increase is in part due to an advance in ship subsidies in consequence of a large advance in salaries of telegraphists during the period and it is counter-balanced to a considerable extent by the increase in expenditure.

In consequence of unfavourable rates of exchange which obtained at the end of the year, considerable sums of money have been allowed to remain abroad on deposit or invested in foreign Government securities. A sum approximating £50,000 has been debited to profit and loss account, calculating the rate of exchange on December 31st, as though the money had been brought home at that date, and the loss incurred. The loss, however, has not been actually incurred, and when in the course of time exchanges improve as no doubt they will do, the sums written off will figure in a future balance sheet as a profit.

Notwithstanding this temporary depreciation and the writing off of some £20,000 representing depreciation in investments in Government securities, the profit for the year shows an increase over the preceding year.

Final dividend of 10 per cent. for 1919, making 15 per cent. for the year. 748 debentures of a par value of £14,900 were redeemed. The total number of public telegraph stations owned and worked by the company on the high seas increased from 2,549 to 2,842. The organisation of the company, together with that of its associated companies, has continued to render inestimable service in the saving of life and property. The Amalgamated Wireless (Australasia), Ltd., in which this company is interested, has paid a dividend of 5 per cent. in respect of the year ended June 30th, 1919. Of the 600,000 new shares offered to shareholders, at par, on May 10th, 1919, 592,726 shares were subscribed. Lord Herschell, G.C.V.O., has been appointed a director.

Cork Electric Tramways & Lighting Co., Ltd.

The revenue for 1919 was £90,869 and the expenses were £70,734, leaving £20,135 plus £3,649 brought forward. Interest on the debentures absorbs £4,600; there is put to reserve for depreciation and renewals, £6,500; to maintenance reserve, £4,000. 5 per cent. dividend on the preference shares requires £6,161, leaving £2,512 to carry forward. The revenue increased by £11,941 as compared with 1918 (of which £4,930 was from the tramways and £6,232 from lighting and power). Expenses increased by £13,349, chiefly due to higher salaries and wages and cost of coal and other materials. The gross profit shows a reduction of £1,408 as compared with 1918. An increase in fares was authorised in August, 1919, and the revenue since that date has materially improved. The increased revenue from lighting and power is mainly due to increased charges. Expenses have materially increased since the last revision of fares, and lighting and power tariffs and further adjustments of charges are now under consideration. Capital expended during the year (£13,290) was mainly for house services, cables and plant. A 2,000-KW. Curtis turbine is now in course of construction. The lease of the Lighting Order from the Cork Corporation which expired in August, 1918, has, after prolonged negotiations, been renewed for a period of 40 years; the approval of the Board of Trade is awaited.

Urban Electric Supply Co., Ltd.

Presiding at the annual meeting recently Mr. P. D. Tuckett said that last year, following on an increase of £28,000 in 1918, the higher price of coal and the rise in wages account for a further increase of £36,000, making a total increase of £120,000 since 1914 for those two items alone. They had repeatedly applied to the Board of Trade for sanction to increases in their charges to meet these increased costs, but the relief obtained had been wholly inadequate. They had hoped that the Bill which, together with Edmundsons' Electricity Corporation, they had promoted, would have given them the right to earn the reasonable return on their capital to which they were entitled and without which they could not properly discharge their statutory obligations. Whereas every other trader, including the Government, had long since met the conditions by a corresponding adjustment of price, this company was still suffering and, indeed, all but perishing, from inability to make such adjustment. It was the only remedy open to them, and it would be a monstrous injustice if it was much longer denied them—both to shareholders and to the staff. It was with much regret that he had to report the rejection of the Bill by the Select Committee of the House of Lords. Since then they had had an interview with the Electricity Commissioners, and they appeared to be alive to the seriousness of the position and professed their anxiety to find a remedy without delay. They were unable to specify the exact form which the remedy would take. The company would leave no stone unturned to get the Commissioners' good intentions converted into definite action at the earliest possible date. No further capital would be put into the business until there was a satisfactory assurance of a reasonable return thereon; yet no business was more dependent on a steady flow of new capital, if healthy development was to continue. But for the war they would have been able to show an available balance to-day of between £50,000 and £60,000 which would have amply sufficed to provide for depreciation and for the payment of a substantial ordinary dividend. Instead, however, of their being in a position to pay an ordinary dividend, they were unable to pay any preference dividend, and were not even able to provide at all adequately for the increased depreciation which the increased cost of

Digitized by Google

plant renewals now entailed. The results were deplorable, and unless the conditions which had produced them were very shortly relaxed, it was quite obvious that the industry, so far as most of the smaller provincial undertakings were concerned, was going to be brought to a standstill. They were not only denied the right to earn a profit, but were compelled to supply at a heavy loss which it was altogether beyond their capacity to bear. So desperate were the straits to which some of the undertakings were reduced, that from sheer lack of funds it was no longer possible for them to pay their men the increased scale of wages which recent awards entitled them to claim. They had, therefore, most reluctantly been forced to adopt, as the only policy open to them, the purely retrograde one of doing everything in their power to discourage development. In the present uncertainty as to the treatment they were to receive, he hesitated to offer any advice as to the value of the shares, but it would be a pity if they were to allow the natural disappointment and discouragement of the moment to induce them lightly to throw their holdings. The enormous increase in the cost of plant and buildings had greatly enhanced the value of the property, and it was only the artificial and unfair restriction of their rates of charge that prevented it from producing a satisfactory return. Provided therefore that they were given the right to charge higher prices, which they were satisfied their consumers would readily pay, he saw no reason why they should look to the future with any less confidence than formerly. The demand promised to be greater than ever, but before they could increase their obligations they must have a reasonable expectation of earning a commercial return. Under the most favourable circumstances some little time was bound to elapse before they could make good the injury, and fully restore the position to what it should be.

German Companies.

The directors of the *A.G. Mix & Genest, of Berlin*, recommend the payment of a dividend at the rate of 7 per cent. for 1919, this contrasting with no distribution in the preceding year.

The Lloyd Dynamo Werke A.G., of Bremen, proposes to pay a dividend at the rate of 7 per cent. out of net profits of 188,000 marks in 1919, as compared with 7 per cent. and 201,000 marks respectively in the preceding year.

The accounts of the *Deutsche Kabelwerke A.G., of Berlin*, including the balance forward, and after making provision for depreciation, show net profits of 1,392,000 marks for 1919, as compared with 896,000 marks in the previous year. It is intended to pay a dividend at the rate of 10 per cent., being the same as in 1918.

The report of *Voigt & Haeffner A.G., of Frankfort-on-Main*, states that a scarcity of raw materials continued in 1919 and caused great restrictions in the production. The net profits amounted to 1,840,000 marks, as compared with 2,003,000 marks in 1918, the dividend being at the rate of 18 per cent., as in the preceding year. It is said that the prospects are not unfavourable provided that a sufficient supply of raw and semi-finished materials is available.

The report of the *Dr. Paul Meyer A.G., of Berlin*, states that the difficulties experienced in obtaining raw materials rendered it impossible fully to meet the demand in 1919, particularly in the new department for electricity meters. The net profits amounted to 675,000 marks, as against 437,000 marks, and a dividend at the rate of 10 per cent. has been declared on the increased capital of 6,000,000 marks, being the same rate as in 1918.

The Ges. fur Elektrische Unternehmungen, of Berlin, states that the tramways in which the company is interested experienced still more unfavourable results in 1919 than in the preceding year. The net profits were derived partly from the sale of foreign investments and partly from the improved results of electricity supply works, they having amounted to 5,792,000 marks, as compared with 4,485,000 marks in 1918. It is proposed to pay a dividend at the rate of 8 per cent., as against 6 per cent. in the previous year, and to devote greater attention to investments in manufacturing works in the future.

The report of the *Bergmann Elektrizitats Werke A.G.*, of *Berlin*, whose accounts have previously been published (12 per cent. for 1919, as in the preceding year) states that an abundance of orders was received for all departments, although the irregularity in the production specially prejudiced the export trade, as it was impossible fully to execute the orders resulting from the resumption of relations. In general manufacturing was limited to the satisfying of normal commercial requirements. Numerous light and power installations and portable motors were delivered for agricultural purposes, and the railway department was chiefly occupied with the completion of heavy high-speed locomotives.

The report of the directors of *Hartmann & Braun A.G., of Frankfort-on-Main*, states that the net profits in 1919 were the lowest in the history of the company. After applying 513,000 marks to depreciation, as against 425,000 marks in 1918, the accounts show net profits of 71,000 marks, as compared with 295,000 marks. Including the balance forward and 100,000 marks transferred from the transition reserve fund, the sum available for disposal is 267,000 marks, as contrasted with 357,000 marks in the previous year. It is proposed to pay a dividend of 6 per cent., as compared with 9 per cent. and 15 per cent. in the two preceding years respectively. As to the cause of the less satisfactory results last year, it was stated at the recent general meeting to be extremely difficult to calculate prime costs and sale prices in times of economic fluctuations, whilst if the coal supply became further reduced the worst apprehensions would be justified. It was also necessary to take into consideration the reserve manifested in the general business, and they would have to be prepared for still further reserve and extensive cancellations of orders.

Havana Electric Railway, Light & Power Co.—For 1919 the gross earnings totalled $9,397,452. Operating expenses and taxes $4,979,685, leaving net income $4,417,767. Net profits from operation and miscellaneous income $3,502,594, out of which has been set aside as reserve for depreciation $622,121, leaving $2,880,473, plus $2,639,025 brought forward, making together $5,519,498, from which has been deducted amortisation of bond discount and expenses $24,250, provision for sinking fund in respect to English bonds of Compania de Gas y Electricidad de la Habana $13,533, provision for sinking fund in respect of consolidated mortgage bonds of Havana Electric Railway $114,870, provision for sinking fund in respect to general mortgage bonds of Havana Electric Railway, Light & Power, $52,728, dividends paid during year (6 per cent. on preferred and common) $2,155,612, leaving to be carried forward $3,158,503.

A Swiss Investment Co.—The directors of the Motor A.G. fur Angewandte Elektrizitat, of Baden, Switzerland, which is a holding company connected with the Brown-Boveri group, state that the undertakings in which the company is interested developed favourably in 1919. The net profits amount to 2,150,000 fr., as compared with 2,271,000 fr. in 1918, and a dividend of 5 per cent. has been declared, as against 7 per cent. A loss of 3,604,000 fr. in exchange is recorded on foreign investments and credits, and has been placed to an exchange account to be redeemed.

Great Northern Telegraph Co., Ltd.—The directors propose for 1919 the distribution of a total dividend and bonus of 22 per cent., including the 5 per cent. already paid, and to transfer £61,111 to the reserve and renewal fund and £55,556 to the renewal fund for cable steamers; £41,667 has been allotted to the pension fund. It is further proposed to set aside £305,556 for extraordinary taxes, and to carry forward £141,607 to 1920.

Siemens Brothers & Co., Ltd.—The annual meeting was held on Tuesday. The dividend, 10 per cent. for the year, has already been mentioned here. According to the *Financial Times*, £5,000 has been placed to buildings reserve, £7,329 to pension fund and retiring allowances, £25,000 to write off from discount the sale of debenture stock, reducing the item to £37,500, £15,000 to general reserve, making £75,000, carrying £315,776 forward, subject to excess profits duty.

At the meeting, Mr. G. Mure Ritchie, the chairman, delivered a very interesting speech on the progress that was taking place in all departments of the business. We shall deal with the matter in our next issue.

Public Issue.—*W. Canning & Co., Ltd.*—The *Times* states that "another industrial flotation that is to be made in the very near future is the century-old business of W. Canning and Co., the Birmingham firm of electro-plate manufacturers and dealers. The present issue is 300,000 ordinary shares of £1, of which 100,000 will be taken by the vendor as part of the purchase consideration."

Stock Exchange Notices.—Application has been made to the Committee to allow the undermentioned to be officially quoted:—

London Electric Wire Co. & Smiths, Ltd.—400,000 7½ per cent. cumulative preference shares of £1 each, fully paid (Nos. 1 to 400,000).

Calcutta Electric Supply Corporation, Ltd.—The number of units sold to consumers has amounted to: Four weeks ended February 27th, 1920, 2,342,360; 1919, 2,009,647. Four weeks ended March 26th, 1920, 2,624,680; 1919, 2,379,613. Five weeks ended April 30th, 1920, 3,764,065; 1919, 3,283,030.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—Interim dividend of 3 per cent., less tax, on the 6 per cent. cumulative preference shares for half-year ending June 30th.

Calcutta Tramways Co., Ltd.—Final dividend of 6s. 6d. per share, free of tax, making 10 per cent. for 1919 on the ordinary shares.

Greenwood & Batley, Ltd.—Net profits for year ended March, 1920, £60,044, plus £14,422 brought forward. Total dividend for the year on the ordinary shares 15 per cent.; £6,000 to depreciation; £10,000 to contingencies; £25,308 carried forward. £174,195 of reserve has been capitalised, and share for share distributed. As a result of revaluation of the works £150,000 appreciation on book value has been added to reserve.

British Electric Traction Co., Ltd.—Dividend of 4 per cent. on the ordinary stock for year ended March, 1920, carrying forward £150,000.

STOCKS AND SHARES.

Tuesday Evening.

The dropping of the idea of a War Wealth Levy had less effect in the Stock Exchange than it might have done had it not been for the fears of dearer money which make themselves felt amongst all the investment markets. Nor is the anxiety confined to investment markets only, inasmuch as the possibilities of an 8 per cent. Bank Rate weigh also upon enterprise as it concerns more speculative operations, and checks business generally. There are those in the City who scoff at the idea of an 8 per cent. rate on this side of September, but the Bank and Treasury have given too recent evidence of their capacity for springing surprises on the monied community for a great deal of certainty to be felt in regard to Bank Rate stability at present. This, in fact, is the predominant influence in markets at the moment, and naturally it has a depressing influence.

The Home Railway market is troubled again by another batch of demands from the railwaymen. As the eel gets accustomed to skinning, so the market for these stocks is by now familiar with the persistent rise in expenses. Therefore prices are not flat. They are simply heavy. Underground Electric Incomes at 58½ are 2 points down, but the shilling shares came into some little request, and moved up to 5s. Districts are lower at 15. Metropolitans have been left unchanged at 19½. It may be worth mentioning that Metropolitan 3½ per cent. debenture can be bought at 57½, with an interest payment due in July, and the yield at this price is 6¼ per cent. on the money. London Electric 4 per cent. preference at 50½ pays practically 8 per cent., and District 4½ per cent. preference is on offer at 56, paying 8⅛ per cent. In spite of the demand that there is for a good many Home Railway prior-charge stocks, these Underground descriptions are somewhat out of favour, though for the longer shot some people regard them as worth picking up at current quotations in order to mix with securities that return less on the money.

Amongst foreign traction varieties, the principal feature is the strength of Anglo-Argentine Tramways 1st preference. The price touched 3¾ before coming back to 3½, the latter showing a rise of 5s. on the week. This is due to the directors' announcement that the company will pay off one year's arrears of dividend to the middle of 1918, leaving two years more, which in money is equal to 11s. per share, to be met later on. This resumption of dividends will have been expected for some time past by those who have followed this column. The company's 5 per cent. debenture stock gained 3½ at 59½, and the second preferences at 3⅛ are the fraction to the good. Brazil Tractions lost 2 points of their last week's jump, and in Mexicans there is nothing fresh to report. A rise of 2 in British Columbia Electric preference advanced the price to 57½. The various dollar securities are a little better on the week, but the rises are mostly confined to a point or so apiece, and no dramatic change has taken place throughout the list. Canadian General Electric preference at 109½ are 2 higher.

Cable companies' stocks exhibit a tendency to sympathise with dulness elsewhere. Eastern ordinary is 3 lower, and Westerns have shed 5s. The various recent issues in this group are somewhat lower, except Western Telegraph new at 3¾ premium for the £1 paid shares. Eastern Extension new are 3 to 3¼ premium, and Globe new 3¼-3½ premium, both £1 paid. The Eastern Telegraph shares, 2s. paid, have been 9s., but eased off to 7s. 6d. There is no rally from the slump in Indo-Europeans which occurred last week. United River Plate Telephones are to receive their usual dividend of 5 per cent., making 8 per cent. for the year, tax free. It is proposed to increase the capital by half-a-million pounds to 2½ millions, though not to make an immediate issue. The shares are of the nominal value of £5, and as the ordinary are quoted at 7½, there is a hint here of a possible bonus presently.

Active business is in progress in the Marconi group, and the shares of the parent company touched 3½ before there was a slight reaction. The price has come up steadily from 2⅞ to the present level of 3 7/16. As already stated here, the support is declared in the market to have come from Italian sources, it being said that certain Italian holders who had sold Marconis heavily, are now taking them back again. The gossip is repeated for what it may be worth, but at any rate the market is in a much more healthy condition than it has been for some time past. With the rise in Marconis has come a sympathetic improvement in Marconi Marines, the price advancing to 2¼, but reacting to 2 later on. The report just out shows that the gross revenue of £772,000 is £208,000 more than that of the preceding 12 months. The dividend of 10 per cent., making 15 per cent. for the year, is the same, however, as that paid for the last three years. The capital was increased some 13 months ago by 600,000 new shares, and, of course, the dividend has to be paid on the extra money then provided. Canadian Marconis remain at half-a-guinea. No market has yet developed in Radios, and, although some of the certificates issued in exchange for the American Marconis have reached this side, the Stock Exchange Committee have not yet given their permission for dealings to take place.

There is little fresh to say with reference to electric lighting shares. It is reported that a certain number of inquiries for the cheapest shares have reached the market, but they have not materialised into buying orders, and prices all round are dull. As one jobber remarked, it is hardly to be expected that people will buy electric lighting shares when they can see to read up to nine o'clock at night. On balance, the only quotable alteration on the week is a decline of 5s. in London Electric preference.

Manufacturing shares are quiet. General Electric ordinary hardened to 32s. 6d., while Henleys at 1⅞ are 2s. 6d. lower. Cromptons retained their rise at 22s., and British Insulated keep firm at 37s. Babcock & Wilcox at 2⅛ show no change. A new issue of Callender's Cable shares of 100,000 ordinary and 400,000 preference is announced. Underwriters were offered one new ordinary at 24s., in company with four new "B" preference at £1. The old ordinary stand about 9s. in the market, and the 6½ per cent. preference at 18s. 9d. Net profit for the year amounts to £161,500, and a 15 per cent. dividend is declared. Armament shares show a tendency to decline, Armstrongs and Vickers both leaning to the heavy side. The rubber market is steady, with the raw material close to a florin per lb. The public are taking little interest in rubber shares at the present time, and the same remark may be extended, indeed, to many of the other industrial sections which make up the Miscellaneous Market of the Stock Exchange.

DIRECT CURRENT COMPARED WITH 3-PHASE CURRENT FOR DRIVING STEEL WORKS PLANT.

By C. A. ABLETT, M.Inst.C.E.

(*Abstract of paper read before the* IRON AND STEEL INSTITUTE.)

THE principal advantage of a three-phase system is that it enables power to be transmitted cheaply over long distances at high voltages. It has, however, the disadvantage that three-phase motors are not capable of speed variation without considerable loss of power, unless they are of a complicated and costly type, and therefore not well suited to many steelworks purposes.

Direct current does not lend itself to cheap transmission of power over long distances, but in most iron and steel works this point is not of importance. Direct-current motors are capable of speed variation over a wide range without loss of power, and this and other natural characteristics render them very suitable for many steelworks purposes.

Most of the merchant mills and bar mills in the British Isles roll a large number of different sections, of which the heavier should be rolled at low speeds and the lighter at high speeds. To get the best results and output from the mills, each section should be rolled at its own particular speed. If such a mill be driven by a D.C. motor, the speed can easily be regulated through a very wide range by a shunt regulator in the motor field without entailing any loss of power, and, as the speed of the motor is reduced, the turning moment increases, so that the maximum turning moment is available where it is required for rolling the heavy sections at slow speeds. The speed remains at about the basis speed corresponding with the setting of the shunt regulator, so that the mill does not run up to high speeds when the bar is out of the rolls.

If an ordinary three-phase motor were employed, the speed could only be reduced by inserting resistances in the rotor circuit, which would cause waste of power nearly proportional to the reduction in speed of the motor. The three-phase motor cannot give any increased turning moment at the low speeds, but on the contrary tends to lose its overload capacity as the speed is reduced, so that to obtain large turning moments at reduced speed, a large and more expensive motor must be installed. When driving a mill at reduced speed, the three-phase motor tends to run up to full speed as soon as the bar leaves the rolls, and also tends to fall greatly in speed while rolling a heavy section; so that the speed varies greatly, which means a poor tonnage from the mill.

Figs. 1 and 2, which give a comparison between the working of a 1,200-H.P. D.C. motor and a 1,200-H.P. three-phase motor driving a mill, illustrate these points.

The full speed of both is 150 R.P.M., and the speed of each motor is reduced so as to drive the mill at 115 R.P.M. A few passes only are shown in the figures for the sake of simplicity.

Fig. 2 shows that the power lost in the three-phase motor is nearly three times as great as in the D.C. motor, and it should be pointed out that while, if the mill were driven by a three-phase motor, a 1,200-H.P. motor would be required, on the other hand, if it were driven by a D.C. motor, a smaller motor than this could be employed with a corresponding reduction in the amount of power lost.

Fig. 1 shows that the speed of the three-phase motor cannot be properly controlled, as it varies from 95.2 R.P.M. to 147 R.P.M.—a variation of 44.8 per cent.—the speed rising to 147 R.P.M. when the bar leaves the rolls. The variation in speed of the D.C. motor is 8.5 per cent., this variation being allowed to enable the flywheel to assist the motor, and this speed variation is capable of being reduced. Fig. 1 shows how greatly the output from the mill would be reduced if it were driven by a three-phase motor, owing to the impossibility of keeping the speed under control.

A number of devices have been used to overcome these inherent difficulties of the three-phase motor; while they enable speed regulations to be obtained without excessive loss of power, and some of them enable the speed to be kept reasonably under control, they usually entail the use of more than one machine, are always much more expensive in capital expenditure, are less economical, and more complicated than the plain D.C. motor.

The operation of a rolling-mill motor and flywheel must next be considered, as the majority of rolling-mills are provided with flywheels. To enable the flywheel to take a part of the power required during a pass, the motor must automatically fall in speed during the pass. This variation in speed under practical conditions—that is, with a flywheel of moderate size and without undue variation in the power taken by the motor—can easily be 10 per cent. to 15 per cent. of the motor speed.

If a D.C. motor be used to drive the mill, this automatic variation in speed can easily be arranged by providing a compound winding in the motor field, which does not entail loss of power. On the other hand, if a three-phase motor be used, the variation in speed is obtained by inserting resistances in the rotor circuit, so that, when the speed falls by 15 per cent., practically 15 per cent. of the motor power is wasted. If the speed variation is to be less than this—which is, of course, an advantage from the point of view of obtaining a greater output from the mill—either a greater variation in the motor power must be allowed or a heavier flywheel must be used; and there is not much scope in the latter direction, as the practical limit in flywheel weight is soon reached.

Devices employed for varying the speed of mill motors intermittently, such as the so-called automatic slip regulator, are too slow in action to be of value with the type of mill which is here referred to.

The foregoing remarks show that three-phase current is unsuitable for driving merchant and bar mills. Compared with direct current it is either wasteful of power, involves loss of output from the mill, or involves an unduly high capital cost. Three-phase current has, however, been extensively used in America for driving mills, but there commercial conditions are different from those prevailing in the British Isles, for the tendency in America is for large tonnages of a particular section to be rolled in one mill, so that the question of speed regulation becomes of less importance than in Great Britain, and consequently the three-phase motor is not at so great a disadvantage. In visiting American mills the author has nevertheless seen a number of cases where three-phase current has been used where better results would be obtainable with direct current.

It may be pointed out that where means are available for readily varying the speed of the mill, increased output is sometimes to be obtained by gradually increasing the speed of the mill as each billet is being rolled, so that the first passes on the billet are made at a moderate speed, and the last passes on the finished section are made at a high speed. This method of working has been developed to a considerable extent in certain large three high continental mills where very large tonnages are obtained. While the majority of mills of this description have been driven, with good results, by a motor coupled to a flywheel, there is, in the author's opinion, too great a tendency to accept the flywheel without

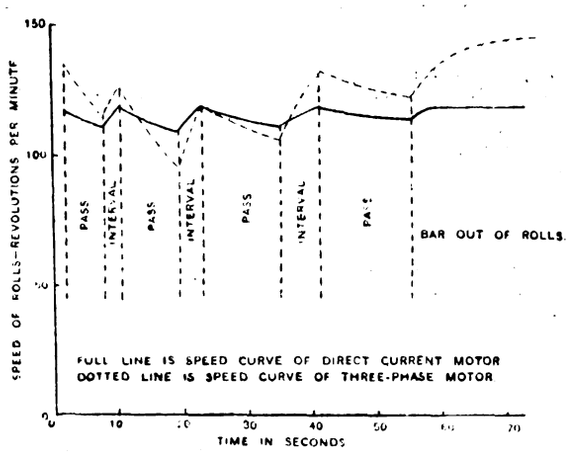

FIG. 1.—SPEED VARIATION OF DIRECT-CURRENT AND THREE-PHASE MOTORS WHEN SPEED IS REDUCED.

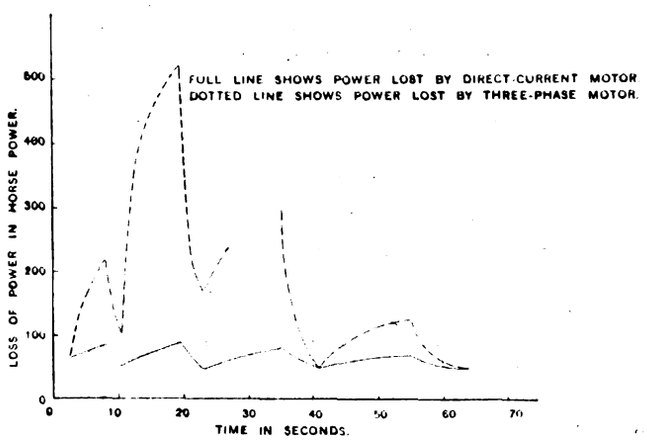

FIG. 2.—LOSS OF POWER IN D.C. AND THREE-PHASE MOTORS UNDER THE SAME CONDITIONS AS FIG. 1.

LOSS OF POWER IN THREE-PHASE MOTOR IS 2.92 TIMES THAT OF DIRECT CURRENT MOTOR.

Digitized by Google

considering the possibility of obtaining an increased output if it were dispensed with. When a new mill is being put down, this point should receive full consideration. A rolling-mill motor should not be regarded merely as a motor to drive a rolling-mill, but, if the best results are to be obtained by electric driving, the rolling-mill plant, if new, and the mill motor should be suited to one another, and both the mill and motor be considered as a combined plant.

It should be remembered that rolling-mill plants have been developed in connection with the steam drive. The electric motor has certain different characteristics from the steam-engine, and full advantage should be taken of these differences.

The proportion of sheet and tinplate mills which are driven electrically is not so great as the proportion of merchant and bar mills, and the statement has frequently been made that it is cheaper to drive hot mills by steam than electrically. The author believes that there is a foundation for this statement, and that the reason is as follows:—

The speed of the rolls in such mills is usually from 30 to 40 R.P.M., depending on the roll diameter, and when driven by a steam-engine, the engine is generally direct coupled. Where electrical driving has been adopted, a motor running at a comparatively high speed has been used which drives the mill by ropes or by gearing. Now, the variations in the power required to drive such mills are very great indeed, perhaps greater than with any other type of mill, so that the average power consumption is only a small fraction of the maximum power.

The rope or gear drive entails a certain loss of power which is going on continuously, so that, while this loss of power may be only a small percentage of the maximum power, it still forms a very substantial addition to the average power, so that it materially increases the energy consumption measured in kilowatt-hours per ton rolled.

If a three-phase motor were installed to drive such a mill, this loss of power would be accentuated by the loss which occurred in the resistances connected in the rotor circuit, which are necessary to enable the flywheel to give up power when required, and these losses, while they may be only a small percentage of the maximum power, make a substantial addition to the average power taken, thus materially increasing the energy consumption expressed in kilowatt-hours per ton rolled. Now, in the author's opinion, if such a mill be driven by a low-speed motor running at 30 to 40 R.P.M., the running costs of the electrical drive would be found to be considerably cheaper than those of the steam-engine, for these various losses of power would be eliminated. From results in the author's possession, he considers that the adoption of the direct drive would be found to reduce the consumption expressed in kilowatt-hours per ton by something like 40 per cent.

There is no engineering difficulty in installing a D.C. motor running at a speed of 30 R.P.M. for driving a sheet mill. Such a motor would be larger and more costly than a high-speed motor, but when all the circumstances are taken into account the savings to be effected should be found to make a very substantial return on the extra capital cost. On the other hand, there are serious engineering difficulties in constructing a three-phase motor to run at a speed of, say, 30 R.P.M. If the electrical supply were 50 cycles, the motor would have to have 200 poles, and the power factor would be so low that the operation of the power generating plant and supply system would be very adversely affected.

The above remarks apply only to the hot mills in sheet and tinplate works, and not to the cold rolls, which require practically constant power to drive them at a constant speed, so that for cold-roll driving there is very little to choose between direct and alternating current.

The reversing mill is driven by a direct current motor, supplied with current from a motor-generator set coupled to a heavy flywheel.

The motor of the motor-generator set would have a normal power of about one-fifth or one-sixth of the power given by the mill motor when at work, and the question is whether it is better that this set should be driven by an A.C. or a D.C. motor. For example, a 2,000-H.P. motor may be used to drive the set, of which the flywheel at full speed would have a total stored energy of 200,000 H.P.-seconds, of which 72,000 H.P.-seconds would become available for neutralising the variations in the power.

The speed of this motor would be so varied by some form of relay connected in the circuit supplying the motor that the power in the circuit would be maintained at as nearly a steady value as possible—that is to say, that the speed of the motor would be reduced when the bar was in the rolls, so that the flywheel could supply part of the power required by the mill motor, and when the bar was out of the rolls the speed of the motor would be increased, thus increasing the stored energy of the flywheel. In some works this relay has been connected in the main power circuits of the power-house, so that the flywheel of the reversing rolling-mill equipment is not used merely to maintain the power required to drive the reversing mill at a constant value, but for a much more useful purpose—namely, to keep the power supplied by the power-house as constant as possible by providing the power required for heavy peaks of short duration, which may be caused by other parts of the plant, from the stored energy of the flywheel. This is a valuable asset, because if the power is supplied from a gas-engine station, of which the overload capacity is not very great, it may save an additional engine, and in any case the more constant the power-house load is kept, the cheaper the supply of electrical power becomes.

If the 2,000-H.P. motor driving the motor-generator set is a D.C. motor, it will not only cease to take power from the power station if a heavy peak occurs elsewhere in the works, but can act as a generator and supply electrical power drawn from the stored energy of the flywheel to help the power station. For a peak of short duration the motor thus acting as a generator can work up to double its normal capacity, and can help the power station to the extent of something approaching 6,000 H.P. for a short time. If, however, a three-phase induction motor be used to drive the motor-generator set, it cannot generate power to help the power station, but can only cease to take a considerable portion of its power from the power station. Thus the D.C. motor is about three times as effective as the three-phase motor in helping the power house to overcome peaks.

It has also been pointed out that the motor-generator set has to be made to fall in speed artificially so that the flywheel can give the surplus power required by the reversing mill motor; this fall in speed would be of the order of 20 per cent. If a D.C. motor be used to drive the motor-generator set, this fall in speed does not entail any loss of power, but if a three-phase induction motor be used, the 20 per cent. fall in speed means that a considerable proportion of the power supplied to the motor is wasted.

On the average it may be taken that 10 per cent. of the power supplied to the three-phase motor is wasted, which would increase the kilowatt-hours per ton and consequently the cost of energy for rolling by 10 per cent.

A motor-generating set driven by a three-phase alternating motor is limited to certain speeds corresponding to the synchronous speed of this motor. If the supply be 50-cycle, the synchronous speeds within the practicable range are 600, 500, 428, and 375 R.P.M. It may happen that the flywheel or the variable-voltage generators can run at higher speeds than the corresponding synchronous speed, so that if they are driven by three-phase A.C. motors they are not being used to the best advantage, and if a D.C. motor were used the motor-generator set could be run at a higher speed, and thus the capital cost of the reversing rolling-mill plant could be reduced.

The electrical drive of the live roller gear requires careful consideration, for if live rolls cannot be handled rapidly a good output cannot be obtained from the mill, however good it may be. The following considerations will show that live roller gear driven by D.C. motors can be handled more rapidly than if it were driven by three-phase motors.

The turning moment of the D.C. series motor varies with the square of the current, while that of the A.C. motor varies directly as the current. Therefore the D.C. motor can accelerate the live rolls much more rapidly than the A.C. motor. Conversely, in decelerating the live roller gear, the D.C. motor gives a much more powerful retarding effect than the three-phase motor, so that the former proves a more effective machine for reversing live roller gear than the latter.

Another disadvantage of the three-phase motor is that its turning moment is proportional to the square of the voltage, so that if the voltage falls, say, 10 per cent. the turning moment is decreased by 19 per cent. The turning moment of the D.C. motor is directly proportional to the voltage. This tends to make the three-phase motor sluggish where voltage variations occur.

In a certain large American steelworks where there is a large power house in the works generating three-phase current, direct-current live-roll motors have been installed throughout for this very reason, and the whole of the power for driving these motors is converted to direct current by rotary converters supplied for this purpose.

The cheapest way of obtaining power in iron and steel works is to utilise the blast-furnace and coke-oven gases, or other sources of waste heat, to the fullest extent. If these natural resources of the works are utilised in the most economical manner it will generally be found that they will provide all the power required by the works.

Where large low-speed alternators are driven by gas engines some peculiar resonance effects can be produced, and these have proved exceedingly troublesome in certain power houses. If the alternator be driven at a uniform speed by its engine, it can be set swinging, say, by a sudden overload or other causes, at its natural time of vibration about its uniform speed of rotation. If the alternator and flywheel are properly designed, these vibrations, when once started, will die away quickly. If, however, the natural time of vibration happens to coincide with the time which elapses between the successive working strokes of the engine or certain multiples of them, the vibration may become so violent that it is impossible to run the engine.

If a number of gas engine-driven alternators be running in parallel, serious difficulties can occur by the natural time of vibration of one of the alternators coinciding with the time between the working strokes of an engine driving another machine, so that it becomes impossible to run the two machines in parallel. The author has had experience of several cases of this kind.

To avoid the possibility of such resonance the proper weight of the flywheel has to be selected. Gas engine-driven D.C. machines are usually cheaper in capital cost than gas

Digitized by Google

engine-driven alternators, and have the advantage from the engineering standpoint that these resonance troubles do not take place.

Steam turbines directly coupled to three-phase alternators have been built in such large sizes and have proved themselves to be so reliable that they call for no special comment.

Direct-current turbo-generators with a high-speed turbine driving a comparatively slow-speed dynamo through some form of double-helical gearing have been built in sizes up to 6,000 kilowatts, and it is probable that natural development will lead to the construction of considerably larger sizes and that the turbines will run at higher speeds than 3,000 R.P.M., which is the highest possible speed of a three-phase, 50-cycle turbo-alternator. Such gear-driven sets have proved very reliable in operation, and from the engineering standpoint there is little to choose between three-phase and D.C. turbo-generators.

The capital cost of the D.C. geared turbo-generator is higher than that of a three-phase turbo-generator. The question to be decided, therefore, is what return the more economical application of direct current in the steelworks will make on the increased cost of the power house.

It has been shown that direct current should be adopted as the system of supply of a steelworks, and this leads to the consideration of the question of linking-up with power supply authorities which supply three-phase alternating current.

The following reasons have been advanced in favour of linking up:—

(*a*) That the power supply authority provides a standby to the works power house.

(*b*) That the power supply authority provides a possible market for the surplus power of the works.

It is evident that if a power supply authority undertakes to provide a standby of, say, 1,000 kilowatts, it must invest capital in an additional 1,000 kilowatts of plant in its boiler house and power station, and also invest a considerable capital sum upon its distribution system over and above the plant needed for its normal requirements.

The authority has capital, depreciation, and maintenance charges to meet on this additional plant, and must provide for a definite payment per kilowatt which it contracts to keep as a standby.

For the purpose of illustration, assume the capital cost to the supply authority of the plant and distributing system for providing 1,000 kilowatts standby to be £40,000. Then the power supply authority would make a minimum annual charge of the order of £6,000 to recompense it for out-of-pocket expenses—namely, capital, depreciation, maintenance charges, &c.—on the standby plant, whether this plant is used to supply power or not, and in addition if power is required from this plant it would make the ordinary charge per unit of electricity supplied.

The standby supply may be regarded as an insurance against exceptional circumstances. It is necessary for the works owner to assure himself that the power supply authority is carrying out its obligation by installing the plant necessary for providing a standby supply at any time.

It would appear better for works having blast-furnace gas, coke-oven gas, or other sources of power, to install their own standby plant rather than pay other people to do it. If they install their own plant and charge themselves annually a similar sum to that which they would be paying a power supply authority, the cost of the plant will soon be paid off. If, on the other hand, they rely upon the authority, this annual charge goes on perpetually.

In considering the second point, the question arises what price the power supply authority would be willing to pay for surplus power. A power supply authority is usually willing to pay 0.05d. per unit of surplus energy delivered to it by a works, and as on the other hand the authority usually charges about 0.5d. to 1.0d. per unit in selling its power to a works, the authority is apparently making a very substantial profit on any surplus power which it buys. If this be considered from the authority's point of view, it will be seen that surplus power is not of great value because, as a rule, it cannot be supplied when it is of value.

The works as a rule need the full output of their own power plant for themselves during the ordinary working hours of the day, and could only supply surplus power to the power supply authority at other times, when the authority does not need it, and when it is in consequence of little value.

It is evident, therefore, that the interests of the iron and steel works having their own power resources and those of a power supply authority do not coincide; there appears to be no advantage in linking-up with the power supply authority, and it would be more profitable to the iron and steel works to find a means for using their own surplus power, which is one of their valuable assets.

Protection against X-Rays.—At the Academy of Sciences, on May 27th, M. Daniel Berthelot announced that an important discovery had been made by Dr. Pech, which would ensure the protection of operators against the effects of X-rays. It consists of a process which neutralises the ultra-violet rays by the simultaneous application of infra-red rays.

WATER POWER IN SCANDINAVIA.

The Council of the Swedish Water Power Association (Svenska Vattenkraft Forening), reporting to the members at the tenth annual meeting, held in Stockholm, on May 27th, stated that the active interest manifested in the utilisation of the national water powers during the years of war slackened somewhat during the past year. In explanation of this fact it was mentioned that the construction of hydro-electric works, and the prosecution of the electrification of the country districts, were proceeded with at a slightly slower rate in 1919 than in the preceding years owing to the decline in the period of prosperity in certain districts and "the increased supply of fuel oil."

Mr. Sven Lubeck then discussed the present situation of the question of power and fuel supplies. At present, he stated, the water powers already in service represent 1,150,000 turbine horse-power, whilst plant for a further 250,000 H.P. is in course of construction. The normal imports of pit coal at the beginning of the war ranged from 5,000,000 to 6,000,000 tons per annum. On the assumption that further water power representing 2,000,000 H.P. is brought into use within a period of 40 years forward, corresponding to 50,000 H.P. per annum, and allowing for normal development of consumption, it is calculated that it will afterwards still be necessary to import 5,725,000 tons of fuel per annum, including 250,000 tons of crude oil, petroleum, and benzine. In the opinion of the author, the hydroelectric industry is confronted with three principal problems: (1) The rational utilisation of available water powers by the regulation of the lakes and profiles; (2) the electrification of the country in connection with the economic distribution of power on a systematic basis; and (3) the facilitation of the industrial use of the Norrland water powers. In judging the question of economy in power, it is submitted that consideration must be given to the circumstance that after years of normal development the water powers in the South and in Central Sweden have practically all been brought into use. The solution of the power question in different parts of the country must gradually take place by the exercise of the greatest possible economy in the water power resources, the uniform regulation of the waters, the provision of reserve stations at appropriate places, particularly along the coast line, the use of peat, and the supply of power from the more richly endowed district of Norrland, and possibly also from Norway in the course of time. Indeed, the author is of opinion that some of the Norwegian water powers in future may find use in connection with Swedish interests to the advantage of both parties. At present hydroelectric power finds an increasing use in the Swedish wood and iron and steel and textile industries, but more particularly in the electrochemical industry, and the future prospects for the use of the power lie chiefly in the electrochemical and electrometallurgical branches.

The second contribution to the meeting was made by Mr. Ingvar Kristensen, director of the Norwegian waterfall administration, who dealt with the question in relation to Norway. Leaving falls of less than 1,000 H.P. out of consideration the author mentioned that the available water power represents 12,000,000 to 13,000,000 turbine H.P. per annum, of which only 1,400,000 H.P. is being utilised. The Government has purchased water powers amounting to 2,000,000 H.P. in different parts of the country so as to be able to have power available in connection with the conversion of the railways and the general supply of power, and for other public purposes. In fact, by this means and by the revision of the legislation concerning water courses and the strengthening of the water administration, the State is able to exercise a regulating influence over the use of water powers, which can now only be utilised on the grant of a State concession for the purpose.

GAS ON TRAINS.

We recently mentioned briefly the report of a collision on an Indian railway, which was followed by a fire in which many people were burned to death. Particulars have been published in the *Pioneer Mail* of April 30th from which we derive the following details:—

The collision occurred near Mewa Newada station, Oudh and Rohilkhand Railway, near Moradabad, between an express and a goods train. Two vehicles at the rear of the goods train were smashed. Two vehicles at the rear of the goods gas fitted, were smashed and burned.

The accident occurred at 2.30 a.m. on April 26th.

The first three bogie carriages were completely smashed, and with the bursting of the gas-holder, caught fire. All the carriages were overcrowded, and among the passengers were three Hindu marriage parties and 50 Gurkha soldiers. Of the former only three, and of the latter only four, are reported to have escaped. All the rest were either killed outright or burned to death. The first bogie was a third-class and the

Digitized by Google

second an inter-class; the third was half full of men and half full of women passengers. Few of the women and children came out alive. Sixty-two wounded were brought to Moradabad in a relief train.

An eye-witness gives a heartrending account of the sufferings of those who were killed, burnt to death, or wounded. Most of the wounded went without any medical aid for ten or twelve hours, until they were admitted to the hospital.

Professor W. G. P. Wall, of the Training College, Allahabad, gave the following details:—

There were only four Europeans in the carriage in the centre of the train. So far as the Indian passengers (mainly third-class) were concerned, the train, unhappily, was crowded.

Professor Wall was awakened by a violent shock, and was first out of the train to see what had happened, closely followed by other Europeans. The train was at a standstill, and the first portion was even then blazing furiously. They ran along the train, and as they ran they saw an Indian running across a field with his clothes on fire. They extinguished the flames, but the man was so terribly burnt that he died a few hours later.

They then hurried to the wrecked carriages, where the sight which met them was a terrible one. The day had been very hot and dry, and all the woodwork was like tinder. The collision must have shattered the gas cylinders under the third-class carriages, and when the gas caught fire all the wreckage burnt rapidly and inextinguishably.

Meanwhile, the dry wind which had been blowing seemed to increase greatly in strength and carried the flames along the train. Most of the passengers succeeded in escaping out of the third bogie with slight injuries, though the bogie itself was burnt; but in the first two bogies the majority of the passengers were pinned under the heavy tangled wreckage, from which it was impossible to extricate them.

After the European passengers, with two or three Indians who rendered eager and useful help, had pulled out all the injured who could be reached, there were still a large number of sepoys in the first carriages and men, women and children in the second bogie, caught under bent steel framework or woodwork, who could not be brought out.

They could be seen struggling vainly with the flames rapidly spreading towards them, but nothing could be done. "I could not sleep last night," said Mr. Wall, "because of the memory of it."

We do not wonder at this; it is painful enough to imagine the scene without having witnessed its horrors. When will the use of gas on trains, with the frightful possibilities by which it is accompanied, be abolished? It is like carrying live shell with the safety devices removed—but worse, for instantaneous destruction is vastly preferable to the mental torture of the approaching flame, followed by the physical agony of roasting to death.

THE MID-LANCASHIRE ELECTRICITY DISTRICT.

THE Electricity Commissioners, as briefly stated in our last issue, have taken their second step under Sec. 5 of the Electricity (Supply) Act, 1919, this time with reference to the re-organisation of electricity supply in part of the county of Lancaster, by the issue of a notice that they have provisionally determined that the undermentioned area shall be constituted a separate electricity district for the purposes of the Act, that is to say: The county boroughs of Blackburn, Blackpool, Burnley, and Preston; the boroughs of Accrington, Bacup, Chorley, Clitheroe, Colne, Darwen, Haslingden, Nelson, and Rawtenstall; the urban districts of Barrowford, Brierfield, Church, Clayton-le-Moors, Croston, Fleetwood, Fulwood, Great Harwood, Kirkham, Leyland, Longridge, Lytham, Oswaldtwistle, Padiham, Poulton-le-Fylde, Preesall, Rishton, St. Annes-on-the-Sea, Thornton, Trawden, Walton-le-Dale, and Withnell; and the rural districts of Blackburn, Burnley, Chorley, Clitheroe, The Fylde, Garstang, and Preston; which area is more particularly delineated on the accompanying map.

Objections or representations may be made on account of the inclusion of any area in, or the exclusion of any area from, the district so provisionally determined, and all such representations must reach the offices of the Commissioners not later than September 30th, 1920.

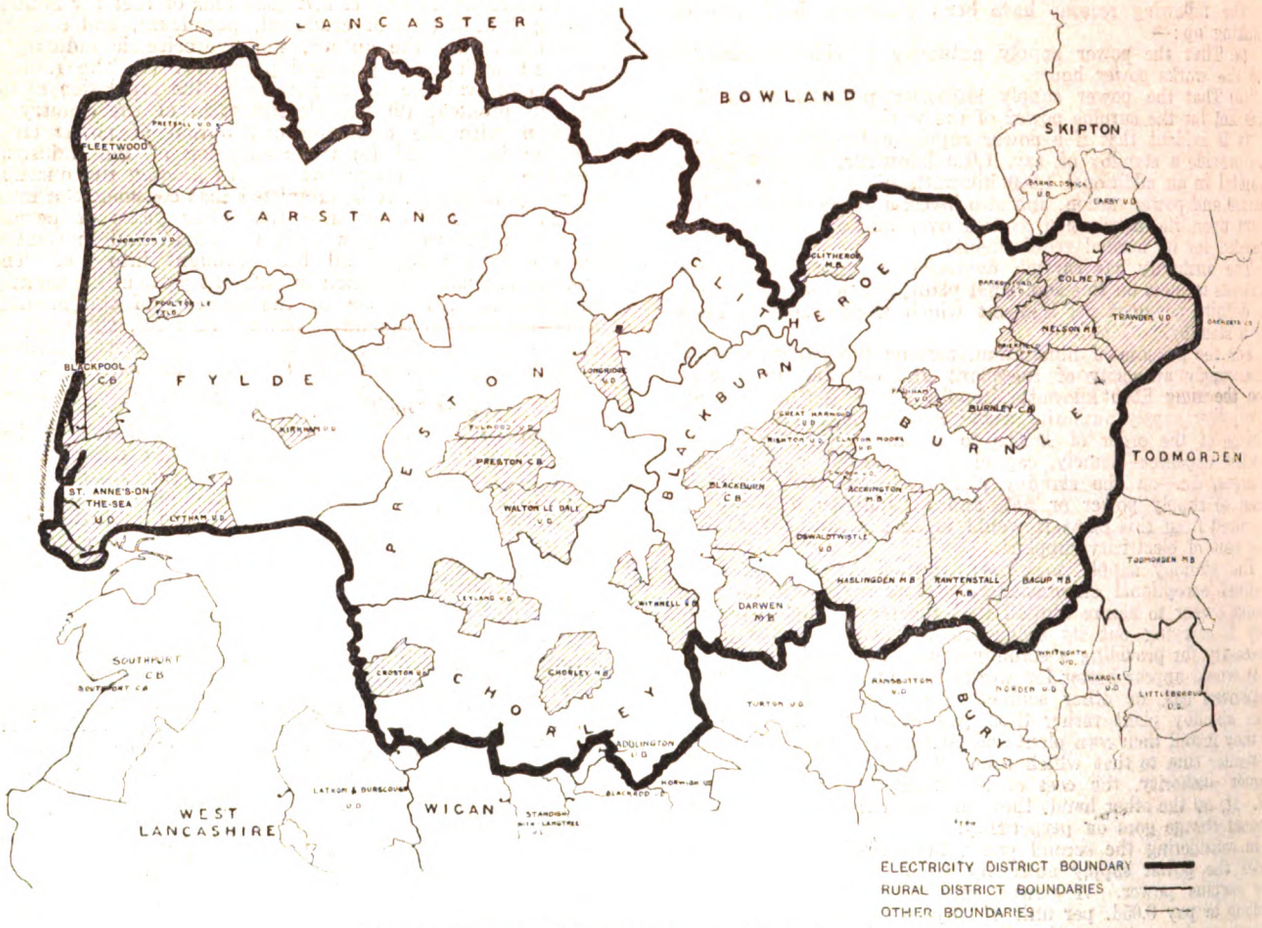
It being apparent to the Electricity Commissioners that the existing organisation for the supply of electricity in the district so provisionally determined should be improved, notice is further given that they intend to hold a local inquiry into the matter, and any authorised undertakers as defined in the Act may, before September 30th, 1920, submit a scheme for effecting such improvement in organisation, including the formation of a Joint Electricity Authority for the district, and any proposals for altering or adjusting the boundaries of the district so provisionally determined.

Notice is to be given of the date of the proposed inquiry.

It will be noted that the two notices have again, as in the case of the Lower Severn District, been issued in one document, which may be taken as a desire to concentrate and curtail the proceedings.

In contrast to the first provisional district, the present area is a thickly populated industrial one. Except for the western boundary of the district which follows the sea coast, the boundaries are not marked by any topographical features. On the east and north-east the county boundary is followed, while on the north and south rural district boundaries mark the limits.

Blackburn and Preston form the centre of the area, and it is in these two adjacent districts that the two largest generat-



MAP OF PROPOSED MID-LANCASHIRE ELECTRICITY DISTRICT.

Digitized by Google

ing stations will in all probability be located, indeed the building of one of them has already been commenced.

Several of the larger electricity supply undertakings included in the district are in urgent need of extension of their plant, and a commencement has already been made on such work in some instances. It will be remembered that the foundation stone of the new Whitebirk station at Blackburn was laid last month. This enterprise will cost about half a million sterling, and there is ample scope for future extension. The initial installation will comprise two 10,000-KW. turbo-alternator sets generating at 6,600 volts three-phase, and it is hoped to have one set in operation by the end of this year. The station is in close proximity to railway and canal; there is also a large quantity of peat on the site, and a Scandinavian expert has reported favourably on its use as a fuel. Mr. P. P. Wheelwright, engineer-in-chief, may also have considered the feasibility of the use of gas from the Greenbank gasworks as a fuel should circumstances necessitate such a course. A second new station will very likely be established in the area. This will probably be commenced next year on the south bank of the Ribble at Preston, where a dam is proposed to be constructed. A link between the Preston, Blackburn, and Burnley stations is also contemplated, and the latter undertaking is proposing to borrow £150,000 to cover the cost of extensions that are needed. In April the chief engineer at Burnley reported on the extensions required in the undertaking, and the proposed linking up with other undertakings in connection with the establishment of the area. Nelson contemplates the expenditure of over £152,000, and tenders for part of the extension were accepted in February last. At Blackpool new plant is also to be installed and negotiations have taken place between the Corporation and the Fylde Water Board, upon which, in the event of the present works being extended, the Corporation will be dependent for an adequate supply of water for condensing purposes.

The whole of this activity has taken place this year, but the demand for electricity is increasing to such an extent, owing to the electrification of mills and factories, &c., in the area, that most of the additional output that will be available when the various extensions are completed has already been fully booked up.

To make a prediction in conclusion, the next area to be provisionally determined will most likely be that of the North-West Midlands in the Black Country. Such an area would include the two proposed large stations at Stoke and Rugeley on the river Trent, and that at Ironbridge on the Severn. This district would embrace Staffordshire, with the important stations existing at Wolverhampton, Walsall, Tipton, West Bromwich, and Stourbridge; part of Shropshire, including Shrewsbury; and part of Cheshire, including Crewe. Moreover, it would lie between the two areas that have already been defined on the south and north.

An Electrically-Propelled Ferry.—Sketches were recently published by the *Pacific Marine Review* of a double-deck ferry boat 191 ft. long by 44 ft. beam; the propelling machinery consists of two Diesel engines driving dynamos which in turn supply a motor directly connected to the paddle wheel shaft, and in order to ensure efficiency at a low rate of revolution, the motor is made of large diameter.—*Technical Review.*

ELECTRIC FURNACES.

THE electric furnace, which by reason of its cleaner and more economical working is still finding more and more favour in the eyes of the metal industries, is rapidly extending its field. The Leeds Electrical Construction Co. has recently supplied us with details of its products, which include furnaces of many types for various employments, and some of these are now described. The heat treatment of carbon and special steels to be a success requires above all a method of adjusting and maintaining temperature within very fine limits. By the use of an electric furnace this is assured to a reasonable degree of accuracy. The special type manufactured by the company for this purpose is the R.M.D. rotary furnace, an illustration of which is given (fig. 1). This is of the resistance type, the furnace chamber being constructed of special refractory material to withstand a maximum working temperature of 1060 deg. C., and possessing high thermal conductivity and a low coefficient of expansion. The chamber containing the heating element is effectively heat insulated from the outside case of the furnace by material of low conductivity. The energy is conveyed to the heating chamber by means of phosphor-bronze slip-rings mounted on a refractory extension of the chamber, and the connections are enclosed in a cast-iron protecting cover. The furnace is encircled by a worm-wheel which engages with a worm on a shaft rotated by a small motor. This motor and the heating element are connected in parallel so that when the motor is switched off the heating energy is also cut off. The control panel includes a thermostat and cut-out which can be set to switch the power on or off within limits of a few degrees. The current through the heating element is adjusted by means of the resistance shown in the illustration. Another type of rotary furnace suitable for heating rivets is built on similar lines, and is supplied either for stationary work or as a portable unit; in the latter case it is the usual practice to mount the furnace on a trolley. In this set the motor-shaft, ending in a worm, engages directly with the wheel encircling the body of the furnace, and the rotation automatically produces travel of

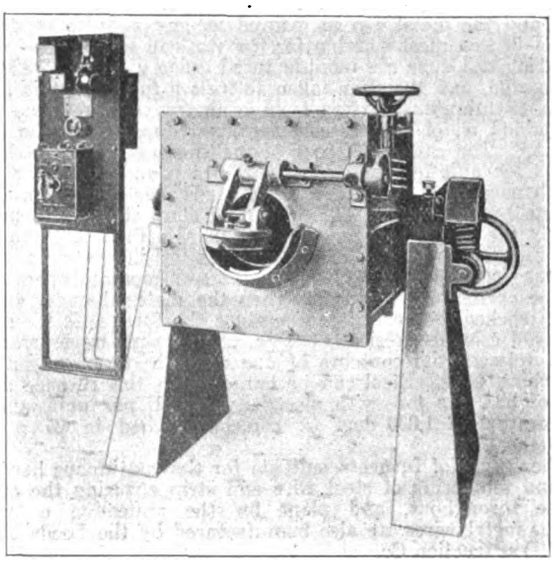


FIG. 2.—ELECTRIC TILTING FURNACE (TILTED).

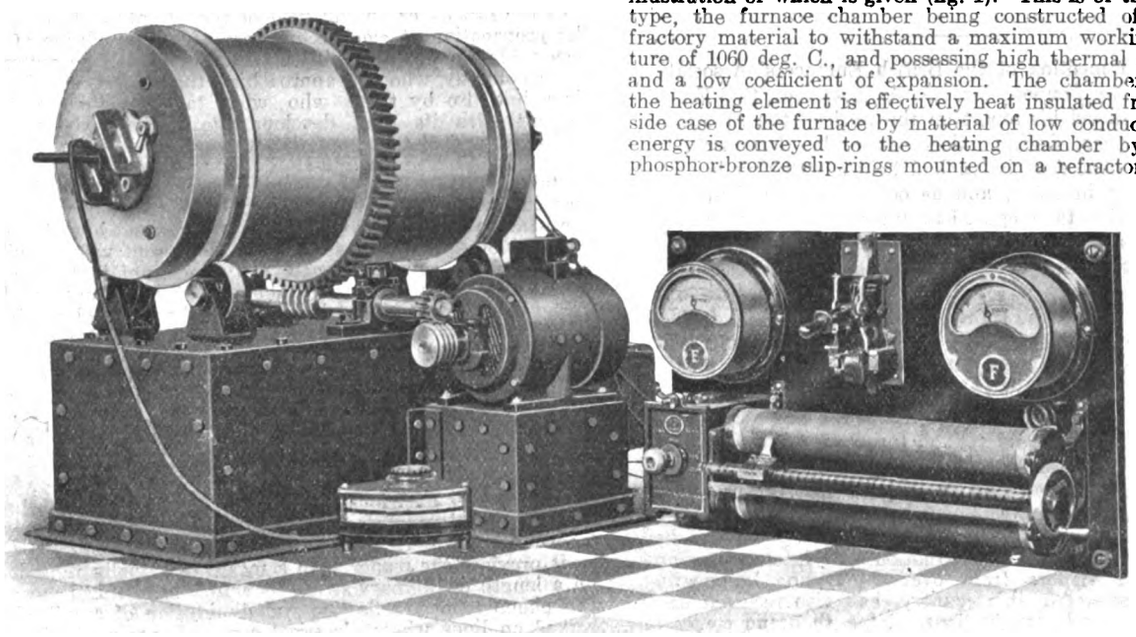

FIG. 1.—ELECTRIC ROTARY FURNACE.

Digitized by Google

the rivets through the furnace. The rivets are fed into one end of the furnace, and the speed of output at the other end is adjusted to suit the various sizes. A notable feature of this furnace is its portability, as owing to its size, roughly 2 ft. × 2 ft. × 1½ ft., the complete equipment can be located in the hull of a ship and other parts generally difficult of access. It is stated that the total energy consumption of this type, when heating ¾ in. diameter rivets at the rate of four per minute, is three units per hour, including the necessary power for the motor. Tilting furnaces such as that shown in fig. 2 are also among the manufactures of this firm. The furnace illustrated is primarily intended for the melting of aluminium, brass and other non-ferrous metals, and is of the resistance type. The metal is contained in a chamber possessing a non-oxidising atmosphere, and there are no products of combustion to be dealt with. The temperature is under control, and the metal can be poured at any definite predetermined degree most suitable for the work in hand. The sizes in which this type are manufactured range from 50 to 300 lb. per charge, and the time taken to melt a full charge is from 35 to 40 minutes, starting from ordinary temperatures, and the period is, of course, considerably reduced after the first "heat." The calculated cost of melting brass, on the basis of 1d. per unit for energy, is .12d. per pound. Another tilting furnace manufactured by the Leeds firm is one designed for the heat treatment of carbon and alloy steels, and particularly for use in tool production. In this furnace there are two separate heat chambers, each under independent temperature control, and by this means two separate operations can be carried out at once. When the material under treatment reaches the desired temperature the furnace is tilted by means of a hand-wheel at the side, and a spring latch arrangement releases the contents of one or both chambers into a quenching tank. Steel can be hardened in this furnace at a cost of 32*s.* per ton with electricity at 1d. per unit, and a temperature of 1,000 deg. C. can be reached in 25 or 30 minutes.

Other types of furnaces suitable for the continuous hardening and tempering of steel wire and strip ensuring the same degree throughout, and plant for the annealing of non-ferrous metal wires are also manufactured by the Leeds Electrical Construction Co.

THE BRITISH ENGINEERS' ASSOCIATION.

At the annual meeting of the British Engineers' Association recently held in London, Mr. D. A. Bremner, O.B.E., the Director, submitted his report on the work of the Association in the past year, during which time he had held his appointment. The Association had held a watching brief for the engineering industry, and as occasion arose, had taken appropriate action to safeguard its interests, sometimes alone, and sometimes acting in conjunction with the Federation of British Industries and other organisations. The matters receiving such attention were: Import, export, and anti-dumping legislation, taxation, transportation, coal supply, fuel oil, petrol, standard forms of contract, and Board of Trade statistics. Considerable attention had been devoted to the development of the utility of the Trade Inquiry, Inspection, and Information Bureau. The offices had been extended to provide for its expansion, and though the staff was a small one, they were able to deal with communications in eight foreign languages. From May, 1919, to March, 1920, 693 trade inquiries were sent out to the appropriate groups of members. Foreign embassies, legations, banks at home and abroad had frequently applied to the Association for information and assistance, and visitors from overseas, having engineering business to transact in this country, had also received helpful information and introductions. Nine thousand copies of the Anglo-Spanish, Anglo-Portuguese, and Anglo-Italian editions of the B.E.A. official directory of members had been dispatched to carefully selected addresses. The 1920 directory would be an all-English edition for circulation at home and in English-speaking countries overseas. Mr. Bremner referred to the reports that had been sent home by Mr. G. C. Sanderson, the Association's special commissioner in Brazil. Sixteen reports had already been circulated to members, and others were to follow. He had sent home privately a good deal of valuable information relating to Brazilian trade matters. Reports were now coming forward from the West Coast of South America, from Capt. R. T. Hird, their special commissioner for Chile, Peru, and Bolivia. In many matters the Association acted in close co-operation with the F.B.I., the National Union of Manufacturers, the British Commonwealth Union, the Industrial League and Council, and National Propaganda. An intensive recruiting campaign was in progress which should lead to an increase in the membership, which was now 580, as against 539 a year previously. A number of members had increased their voluntary assessments for subscription, but the Association must further increase its income or it could not develop.

The annual meeting, held on April 29th, was presided over by Col. O. C. Armstrong, D.S.O. Among other points referred to by him was the burdensome nature of the Corporation tax. After the deduction of fixed interest bearing charges, the whole tax of 1s. in the £ on the total profits would be borne by the ordinary shareholders, and in many cases it might amount to 2s. in the £ on the profits divisible among them, thereby reducing their dividend by 1 per cent. The corporation tax was therefore a more serious matter than would appear at first sight. Later speeches emphasised the need for members to support the Association in its work and in obtaining new members. A resolution was passed recording an emphatic protest against the continuance and increase of the excess profits duty. Mr. Bremner referred to the need for members to strengthen the organisation in every way possible, making it more representative and therefore more powerful, placing at its command the financial resources necessary to make it really effective. Their policy was to serve their members, who were all busy men, rather than to call upon them to sit on innumerable committees, coming up to town from time to time to attend meetings, and more or less dissipating their energies which might be much more usefully applied at their own seat of wealth production. He and the B.E.A. staff were the people who should do the work. In sending out communications their difficulty was to get at the men who mattered; it was difficult to get past the office boy. They were, with that in mind, limiting the number of their communications to those that appeared to be really justifiable to the minds of business men. Mr. H. Allcock referred to the fact that they had in the B.E.A. a weapon to carve their way into the markets of the world. "We want that weapon to be kept bright and sharp and clean and strong, so that when we need it we shall find that it has not rusted in the meantime."

REVIEWS.

The Propagation of Electric Currents in Telephone and Telegraph Conductors. By J. A. Fleming, M.A., D.Sc., F.R.S. Third edition, revised and extended. London: Messrs. Constable & Co., Ltd. Pp. xiv+370, figs. 19. Price 21*s.* net.

In the rapidly extending field of the literature dealing with the propagation of electric currents, this new edition of Professor Fleming's work will be given a cordial reception by those not only who are approaching the subject for the first time, but also by those who wish to keep themselves *au courant* with its later developments. When the lectures, which formed the basis of the work, were first delivered at University College in 1910-11 the utter hopelessness of trying to take notes and at the same time intelligently follow the amazing rapidity with which Dr. Fleming filled and refilled the blackboard with mathematical proofs, must have been felt by most of those who attended. The present volume will go a long way to supply the gaps in the notes of that time, and in other respects to amplify them. It is a long cry from "Short Lectures to Electrical Artizans" to the volume before us, but the same clarity of expression of treatment which characterised the author's early work is still conspicuous in his latest. The distracting mistakes which marred the first issue of the work have been rectified, and the reader is fairly safe to begin the perusal of the book without fear of being arrested by misleading expressions for the value of $\tanh (a+jb)$ or of that for $\int_0^\tau \sin pt\, dt$.

Of the later additions to the original volume, the chapter on the vibrations of loaded strings and their analogies with loaded telephone cables is particularly interesting, inasmuch as it provides the reader with a means of actually reproducing on a length of ordinary string by simple mechanical means all the phenomena of reflection and diminution of amplitude observed on lines whose electrical constants are non-uniform in character. In the chapter dealing with the speed of signalling in cables reference is made to the "cable constant," which is defined as the product of the capacity of the cable, its resistance and the letters per minute which can be sent through it. This, however, is a very arbitrary quantity, which has already been badly upset by such delicate receiving instruments as the Orling and Heurtley relays, to say nothing of the possibilities inherent in the modern amplifier.

The method and description of the Fleming-Dykes capacity bridge for the determination of capacities at any temperature and frequency, as well as the dielectric constant and specific conductivity, is interesting. Values are given for the ratio S/C for various cable dielectrics.

A brief description, with diagrams, is furnished of the Franke alternator for the measurement of the attenuation constant of cables, and a fairly lengthy outline of present day practice in the use of loaded cables and loaded aerial lines.

The remaining chapters deal mathematically with the effect of leakance on loaded cables, the predetermination of the constants S/C and R_1/L_1, and on reflection losses at their junctions.

Machine Drawing for Electrical Engineers. By EDWARD BLYTHE, A.M.I.E.E. Pp. 81; 18 plates. London: The Cambridge University Press. 21s. net.

Text books on machine drawing for mechanical engineers are innumerable, and many excellent works have been published; for some reason, however, very little has been done in this direction for electrical engineers and students.

In the majority of Technical Institutes and Engineering Schools, electrical students take the ordinary course of instruction in mechanical engineering detail, very little effort having been made to specialise in electrical engineering details.

The great development in recent years in the science of electrical engineering and the important part that this branch of engineering will play in the future, demand suitable text books. The above work is an excellent attempt to fill the gap which undoubtedly exists, and is the outcome of the experience of the author, both as an electrical engineer and a technical teacher.

The author has presented a number of systematical progressive exercises, which lead the student through the elementary stages of projection of simple pieces of apparatus, to the preparation of drawings of a similar nature to those found in the modern workshop, and it has been attempted to familiarise him with the method of constructing and reading workshop drawings dealing with purely electrical fittings and detail.

It is pointed out that from contact with pupils in the drawing office, the author has found that most beginners encounter considerable difficulty in forming anything like a clear conception of the construction of an object, from the plans elevation and section executed on the orthographic projection principle, and for that reason small isometric or perspective views have been inserted, with the object of affording assistance in overcoming that difficulty.

The illustrations in the book are large and clear, and are first-class examples of draughtsmanship. The various examples have been selected with the view of illustrating not only the fundamental principles, but also modern types of electrical apparatus. The book will be of great use for teaching purposes in Technical Institutes, and also to all those engaged in preparing electrical drawings. It is a well-thought-out and excellently arranged work, and will have many imitators in the near future.

E. P.

The Management Problem. By EDWARD T. ELBOURNE. London: The Library Press, Ltd. Pp. xi+144+24. Price 4s. 6d. net.

This book is one of those included in the Manufacturing Problem Series, of which series the author is the general editor.

It opens encouragingly enough by saying that while there is to-day great talk of the relations between capital and labour there is too little talk of the connecting link—management. Our readers are already aware that we have lately devoted a good deal of attention, in our editorial columns, to various aspects of industrial relations, and we had hoped to find that Mr. Elbourne's book was one which we could recommend to their notice as carrying the matter further at a single journey than is possible in a weekly paper. The limitations of space, and the demands made upon it by other topics of current interest and importance, exercise inevitable restraint in the case of the periodical; while the book may be expanded to any reasonable length required to carry its subject to a definite point.

We were, therefore, sorry to find, on proceeding with the book, that except for the opening sentence and a passing reference to the unwisdom of management in acting almost entirely as the agent of capital, whereby the distrust of labour had been aroused, it rapidly degenerated into a dissertation on the handling of the workpeople at a factory at Ponders End. Certain general conclusions are drawn from the wartime experience obtained there, but the whole book can best be described as an expression of the author's views and opinions on the right way to run an employment department.

Of the relations between capital and management, management and labour, in their various spheres, we find no helpful word, and of the duty of management to itself no word at all. There is still room for someone to deal at length with this last problem, and it should be done quickly. If management, or, as we have called them, the trained brain workers, will get properly into their place in industry, they will be able to contribute more to the solution of industrial problems than either capital or labour. The management problem is, for this reason, quite the most urgent of all at the present time.

Electricity. By R. E. NEALE, B.Sc., A.M.I.E.E. Pp. viii+136. London: Sir Isaac Pitman & Sons, Ltd. Price 2s. 6d. net.

The aim of this book is to review in a simple way "the general nature of electricity, the methods of producing it, and the services to which it is applied." This forms a rather formidable task, but on the whole the author succeeds remarkably well. He starts off with a chapter on the "sources of electricity" and "kinds of current." This chapter is the weakest part of the book, but those which follow amply compensate for it. A vast amount of useful information is packed into the 136 available pages, and where fundamental principles are dealt with they are clearly and convincingly stated. The author uses arithmetical values to illustrate practical applications at every opportunity, and these should be useful in fixing the ideas of the class of reader most likely to use the book. Chapters VII, VIII and IX, dealing with domestic applications of electricity, are very valuable, and supply authorities would do well to disseminate the information contained therein amongst their consumers. The chapter on electric welding and cutting (No. XIII) is particularly interesting, and is quite up to date. It is singled out for special mention, as its very suggestiveness brings into prominence one of the few serious failings of the book, namely, the lack of references to works on special subjects. Another useful addition would be a short glossary of the technical terms, as it will be impossible for the average reader to get full benefit from the book without this. It would also be advisable to state definitely the relation between the standard units of heat and of electrical energy, as this would provide an absolute base for all the figures quoted relating to costs of electrical processes. The literary style of the work is well up to the usual standard of scientific books, although the value of effusions such as "electrical energy is employed in many forms and degrees between which there are distinctions analogous to those between the mountain and the grain of sand, the precipitous ravine, the undulating foothills and the plain," is not apparent to the reviewer. There are few actual mistakes—kilowatt-amperes (p. 39), within, for with (p. 40), the rectifiers . . . *yield* high efficiency (p. 44) being the most glaring. The illustrations as usual are drawn from the catalogues of manufacturers, but this is not very objectionable considering the object of the book, and the author takes the unusual course of honestly acknowledging their source in all cases. Generally they are good, but fig. 17d is almost valueless. The idea of fig. 13, which shows the principal features of a generating and distribution system, is good. The execution is, however, only mediocre. The printing and binding of the book are excellent, and it can be recommended to all who wish to acquire an intelligent view of modern electrical practice without going deeply into any special part.

C. W. M.

Flow and Measurement of Air and Gases. By ALEC B. EASON, M.A., A.M.I.E.E. Pp. xii+251, figs. 56. London: Charles Griffin and Co., Ltd. Price 25s.

A perusal of this book gives rise to two outstanding impressions, the one a feeling of admiration for the great and painstaking industry of the writer; the other a realisation of the extreme difficulty in arriving at even an approximate generalisation of the laws of flow of gases in pipes.

Whatever formula is adopted, the varying value of the coefficient of friction militates against reliability in practical applications. Mr. Eason fully realises this. He still makes a brave effort to produce order out of chaos, and in Chapter II, after an examination of formulæ of various authorities, gives figures for the value of the coefficient of friction applicable to different classes of work. These no doubt offer a working compromise.

The chapter dealing with loss of pressure in fittings breaks no new ground, and again emphasises the conflict between the values of losses given by various authors.

In his treatment of pneumatic tube problems the author displays a ready familiarity with the subject. There is a not unwelcome lack of that copious quotation of authorities which marks the greater part of the book.

Fig. 4.1 connecting quantities of air used, velocities of air and transit times is particularly interesting. Its usefulness, however, would be enhanced by an account of practical experiments made by the author to test the accuracy of the curves.

One would have liked to see the theoretical aspect of various types of meter supplemented by illustrations and sketches of actual meters, with some remarks upon their practical behaviour. In this connection, the author mostly draws attention to the excellent paper, by Hodgson, on the commercial metering of air, gas, and steam, read before the I.C.E.

In the last few chapters of the book, a return is made to the mathematical disquisition upon the work of various experimenters, only the briefest mention being made of practical matters. Mr. Eason has given us an able summarised mathematical compilation of the work of various authorities. His contribution to the literature on the subject of gas measurement and flow pressure will, however, be regarded by the average engineer as academic. To the designer, the book will prove of value. The curves are well drawn, but would be more valuable if accompanied by fuller explanations, without recourse being necessary to the context.

Two good features of the book are the list of reports, books, and authorities consulted, and, at the end of each chapter, a summarised explanation of the symbols used.—T.W.

The Costing Problem. By EDWARD T. ELBOURNE. Pp. 138. London: The Library Press, Ltd. Price 4s. 6d. net.

This book contains, in addition to the author's remarks, extracts from the cost-finding system of the Federation of Master Printers of the United Kingdom of Great Britain and Ireland; Federation of British Industries' Report "Commercial Efficiency," and Lieut.-Col. O'Meara's paper on "The Functions of the Engineer."

Digitized by Google

Chapter I, "The necessity for costing," deals with certain fundamentals, the relationship between capital and labour, the technical use of costs for establishing production efficiency, which the author states is an instrument of management that has been sadly neglected. Scientific management as practised in America evidently does not appeal to the author, who states that "it cannot be said to give much inspiration to us in this country; it is our privilege and responsibility to work along different lines." This statement is rather difficult to understand, as most of these works on scientific management deal very thoroughly and minutely with the very subject the author chooses for his title.

Chapter II, "All-in Costs," deals with the well-known principles of allocation of costs between prime cost and production "on cost," &c.

Chapter III, "The Functions of Factory Accounts," is self-explanatory.

Chapter IV, "Approximation in Factory Accounting," deals with the distribution of burden charges, &c.

Appendix A, extracts from the Federation printers' cost-finding system, is an example of an up-to-date system, and it is not the first time printing trade costing systems have been quoted in works on costing.

Appendix B, extracts from report of Committee on Commercial Efficiency appointed by Federation of British Industries, dated September, 1918, dealing with fundamentals of costing, is a valuable general treatise. The work concludes with an extract of that very able paper "The Functions of the Engineer: His education and training," by Lieut.-Col. W. A. J. O'Meara, C.M.G., which was read before the Institution of Electrical Engineers in February, 1919. Although this work does not contain anything that has not already been dealt with previously in quite a number of works on costing and scientific management, the book, with many more of its type, is welcome, inasmuch as they emphasise the necessity of ascertaining "true costs of production," which is a *sine qua non* if British industry is to compete successfully in the world's markets.

THE I.M.E.A. CONVENTION.

THE convention to be held at Bradford, next week, under the presidency of the city electrical engineer, Mr. Thomas Roles, meets under rather unusual circumstances; its headquarters are at Ilkley, in charming surroundings, but those very charms have made the district so popular that the summer population in normal times taxes its resources to the utmost, so that the influx of some hundreds of additional visitors attending the convention has almost reduced the accommodation available to "Standing Room Only," and has brought home to the residents the reality of the housing problem in its acutest terms. However, Mr. Roles, who during the last few years has acquired an extensive and peculiar experience of dealing with overloads of 100 per cent., or more, can be relied upon to cope with the new peak load thus laid upon his shoulders. We understand that the members' quarters are distributed over a fairly wide area, not only in hotels and boarding houses, but also in private apartments, and that even the latter are at a premium. As the local train service is somewhat indifferent, some inconvenience to members is unavoidable, but we are sure that they will not allow this to detract materially from their enjoyment of the occasion.

Papers on the design of distributing networks, by Mr. C. A. Gillin (Bradford), and power station design, by Mr. I. V. Robinson (of the B.E.A.M.A.), will afford abundant scope for technical discussion, and one on the standardisation of tariffs by Mr. J. W. Beauchamp (of the E.D.A.) will give an opportunity for the Committee members to join in the debate; they will be taken as read, a procedure which we have long advocated, so that the whole time of the meetings will be available for the discussions. The programme of visits, excursions, and receptions will command general approval, and, granted fine weather, the Convention ought to compare favourably with any of its predecessors.

Besides the subjects above mentioned, the municipal engineers and managers will have plenty to discuss, whether *tête-à-tête* or in open meeting. Both the Committee members and the engineers at their sectional meetings will doubtless be interested in the schedules of salaries which have recently been in the public eye, and now the Trade Unions have thrown down a new challenge which, although at the moment restricted to the Greater London area, is bound ultimately to affect the whole country. The Unions' claim is simple and comprehensive; in effect, they demand that non-union labour shall have no place in the electricity supply industry, in the service of either supply authorities or contractors, and they fix a time limit expiring on July 1st for the decision.

This act on the part of the Unions raises two very important questions: first, the operation of the Whitley Council system, and, secondly, the question whether a British citizen is entitled to earn his living without belonging to a Trade Union.

With regard to the former, while it is to be regretted that an agreed decision could not be arrived at in the bosom of the Joint Industrial Council, and that one "side" of the Council should feel called upon to act independently, we do not think the fact indicates the failure of the system. The machine is of very recent construction, and has hardly "found itself" yet; nevertheless, excellent work has already been accomplished by the Whitley scheme, and if it drop a stitch now and then, it does not follow that the scheme is inherently faulty. We believe that as conditions improve,

Digitized by Google

and the adjustments and lubrication of the mechanism are perfected, harmony will prevail over discord, and the system will work smoothly. In the meantime, the right to strike being inalienable, the Unions cannot be expected to forgo the use of this weapon to press their views when a deadlock is reached on the Council.

As regards the second question, however, we strongly disapprove of the action of the Unions. The question is in no respect one of urgency, and there was no necessity whatever to resort to the big stick in order to compel an immediate decision. Moreover, we must emphatically protest against the claim implied, that every tradesman must belong to a Trade Union. It is true that the Government policy, as embodied in the Whitley Council scheme, favours the extension of the Trade Union principle, as well as the association of employers, because by no other means is it possible to organise a rational system of representation and a channel for negotiation; but, on the other hand, it leaves to every man the right to decide whether he shall or shall not join a Trade Union, a right which is as inalienable in a free country as the right to strike. We earnestly hope that there will be no yielding on this point; to accept tyranny and call it peace is not the way to industrial salvation, and we strongly commend the subject to the attention of the Convention.

Another item that will arouse debate is the bombshell thrown by the Sheffield Town Council into the electricity supply industry. The Council, overriding the advice of the Electricity Committee and the city electrical engineer, has decided to adopt the same rate of charging for both lighting and power. This is a consummation to which all station managers have long looked forward wistfully—but is the time yet ripe for so drastic a proceeding? No doubt the question will crop up in the discussion on Mr. Beauchamp's paper, and we look forward with interest to the views that will there find expression.

The Transport Position in Paris.

THE situation of the transport undertakings in France, as a consequence of the war and its resulting developments, is not materially different from that in other countries which have been directly involved in the war, particularly in Paris and the Department of the Seine in general. Notwithstanding the increases in fares which have been sanctioned by the responsible authorities, it is impossible for most of the electric railways and tramways to balance expenditure and income owing to the enormous advance in working expenses through the rise in the prices of all kinds of raw and semi-finished materials, augmentations in wages, the introduction of the eight-hour day, and the consequential employment of a larger body of men and other matters. If any profits are earned, the amount is too small to affect the accumulated deficits of previous years. The Metropolitan Railway reports a further deficit for 1919, whilst the inconsiderable profits of the Nord-Sud Railway last year do not prevent the deficit from growing still further, although each is able to pay a small dividend as a result of financial arrangements with the City of Paris. In the case of the tramways in Paris and the Department of the Seine, the companies have been living for a year past under a system of loans, the City of Paris and the Council of the Seine covering the deficits incurred. This method was introduced in order to permit the Municipal Council and the General Council to pursue the question of the purchase of the various tramway networks and their reorganisation in the general interest, particularly with regard to the facilities of communication to be established between Paris and the outskirts. In this connection M. Dausset, President of the Commission des Transports, has just informed his colleagues of the course of the discussions which have taken place with the companies. He states that it appears possible for an agreement to be reached with some of them on the basis of a friendly purchase. It is expected that the systems will be unified under one company, in which the responsible authorities will be jointly interested. At least, this is the impression gathered from the statement attributed to the President of the Commission.

Electrical Training for Women.

WITH the characteristic enterprise of the nation one of the Western agricultural colleges in the United States has announced a course in electrical study for young women, which will teach the repair of household electrical appliances. Amongst the subjects to be taught are the localisation and replacement of blown fuses, the repair of broken appliances and lamp cords, the care and simple repair of washing machines, care and operation of home lighting plant, and other problems that are apt to arise.

This is a subject of much interest, and the innovation is one that is worthy of careful consideration in this country, for with the increasing use of domestic electrical devices, the majority of which are used by the lady of the household, some knowledge of the care and maintenance of the apparatus should be taught her.

Perhaps the E.D.A. and other parties interested have not lost sight of the fact that the adoption of such methods would lead to a better understanding of the possibilities of the various appliances, which, with better treatment, would last longer.

Such a course of study would not only be beneficial to the housewife, but also to the electricity supply authority and the dealer in such appliances; for, with better understanding, more would be sold and more electricity used.

It should not be difficult to formulate some such scheme in this country. An educational campaign would abolish the timidity with which most women regard electricity, and restrain a few of the bolder souls who, by their ignorance, cause so much unjustified censure to fall upon the industry.

Power Developments in U.S.A.

ELSEWHERE in this issue we give particulars of a design for a 300,000-K.V.A. steam-electric generating station which, we believe, may be regarded as embodying the latest American ideas on super-power stations. At the present stage of progress, whatever the future may have in store, the main features of a large power station are fairly stereotyped, and variations must be looked for only in the general arrangement, the selection of known methods and apparatus, steam pressures and temperatures, &c.; nevertheless, there is considerable scope for improvement on current practice, and in several respects the proposed design differs materially from its forerunners. It will be noted that the steam pressure in this case is 350 lb. per sq. in., superheated 350° F., so that the maximum temperature of the steam is about 780° F., near the melting point of zinc. The heated air from the turbo-generators is fed to the boilers, and the economisers are supplemented with pre-heaters, while the jet condensers of the separate "house" turbines are operated with the condensate from the main turbines—a novel scheme. The boilers also present new features, tending towards simplicity, and overhead coal storage is reduced to a minimum.

It is interesting to observe that the generating sets are of 35,000-KW. rating. It is very questionable whether it is advisable, on the score either of economy or expediency, to concentrate much more than this in a single set, even in the largest station.

In the course of a discussion on the development of electric power supply before the American I.E.E., also reported in our pages to-day, it was claimed that the kilowatt-hour could be generated with a consumption of less than 1·5 lb. of good coal with generators of 60,000 to 75,000 KW., and station outputs up to 500,000 KW. were considered, with transmission lines operating at 250,000 volts. Such proposals are exceedingly interesting, and we believe that they afford a true indication of the magnificent prospects that lie before the electrical engineering industry, not only in the United States, but in this country also.

DISTRIBUTION MAINS FOR NEW HOUSING SCHEMES.

By H. WILSON, Mains Superintendent, Maidstone.

Most mains engineers have during the last year had put before them a block plan of a new estate comprising anything up to two or three hundred houses, and have had to consider the best arrangement of mains to supply these houses with electricity.

This should be to them a problem requiring careful consideration, and at the same time, an opportunity. A problem, because at the least initial cost they have to give the best possible service, not only for immediate needs, but with an eye for possible requirements during the life of the mains which they are laying. It should be an opportunity, because never before have we had, so to speak, a clean slate to start on. Hitherto we have had to make the best of mains "already laid"—and often not laid with a view to ease in maintenance. We have had up to now to deal with houses built in pairs, with often a great uncertainty as to the future development of the roads in which they are erected. We now have to deal with complete estates—with the concentrated accumulation of six years' building. This gives us a much better chance to strike out from the old approved methods, and to profit by the difficulties which we have encountered in the past years.

The demand of the estate in question will probably make it impossible to supply from distributors already in the neighbourhood, and will usually mean a new feeder from the generating station or the nearest sub-station. The nature of the feeder will, of course, depend on the type of generating plant in use at the works, but the suggestions set out below will apply either to a direct or alternating current supply. If the supply undertaking is fortunate enough to have an E.H.T. supply for outlying districts, the feeder will take the form of a 3-core, H.T. feeder finishing up in a static sub-station, which should be as nearly as possible in the centre of the new estate.

Now, assuming that the supply is to be given by means of a 3-phase, 4-wire system, with the consumers connected between one phase and the neutral, a four-conductor main in each street is a clumsy arrangement, and unnecessarily complicated. It is a difficult main to connect service cables to, and, when the houses have been connected in equal numbers between each of the three phases and the neutral, there is no control of the balance of the phases, *i.e.*, of the relative load on each phase. In the early days of the supply, with only lighting in use, this will be quite satisfactory, but with the gradual installation of heating and cooking apparatus in some of the houses, the system will inevitably get out of balance, and there will be no easy means of correcting this.

As an alternative system the laying of a two-conductor distributor along the front of each row of houses has many advantages; moreover, if the main is dipped in and out from house to house, the main and service cables can be combined, and all underground joints and T-boxes can be dispensed with. This calls for a special cut-out on the consumers' premises which replaces the usual T-box on the main and the ordinary two-pole cut-out usually fixed.

A brief consideration of the accompanying diagram—which is of an actual housing scheme now under construction—will be better than a great deal of description.

"S" is a static sub-station from which three feeder cables are taken to feeder boxes A, B, and C, situated in the rectangular bases of lamp columns. The feeder cables are not shown on the diagram, in order to avoid confusion with the distributor cables which are. Each feeder cable consists of a concentric cable with two conductors, the outer being a 0.1 sq. in. conductor connected to the neutral point of the transformer, and the inner being a 0.2 sq. in. conductor supplied from one phase. The copper has been cut down in the neutral conductor, as when the system is in a state of balance this conductor should carry no current, and the neutral conductors are inter-connected at each of the distribu-

The four points marked "L" are 4-way distribution boxes also situated in lamp column bases.

In the case of the 24 houses marked in groups as D, E, F, G, and H, the distributor which is dipped in and out from house to house is a .022 sq. in. twin, paper, lead, armoured cable laid direct. All other distributors consist of 0.05 sq. in. twin cables of similar construction.

Should the distributors become overloaded due to increased load for cooking and heating, it is proposed to extend the feeder cables from the points A, B, and C, to the four distribution boxes marked "L."

The advantages to be claimed for the system here set out may be summarised briefly as follows:—

1. It gives a permanent control of the balance because the area supplied by each phase can be

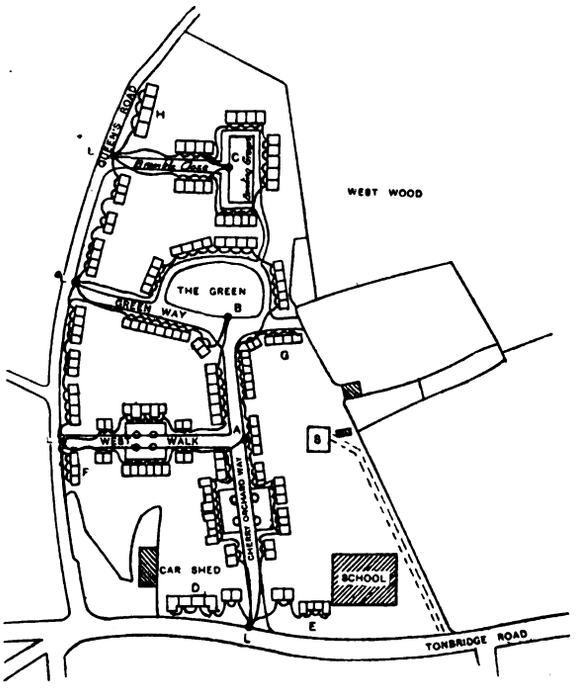

Fig. 1.—Diagram of Distribution System.

altered by adjustment of the links in the lamp column distribution bases or in the houses.

2. It gives a duplicate supply to most of the houses, as by "feeding" from two ways a faulty length of cable between two houses can be disconnected without opening the ground, and can be dispensed with for the time being, without leaving any consumer disconnected.

3. It gives great accessibility to the mains, in the event of a fault developing anywhere on the network. Mains engineers will appreciate the fact that they can get at both ends of a faulty length for testing purposes without opening any ground. It also provides great facilities for rapidly localising any fault which may occur, and for the restoration of the supply. With the advent of electric cooking this will be more important than it has been in purely lighting districts. At the points on the estate where a duplicate supply is not available, that is, where it is impossible to feed from both ends, it is very easy to replace a faulty length with a temporary overhead cable and so restore the supply for the time being, and in this event it is not necessary to open the ground to clear the fault before the supply can be restored to consumers past the point of breakdown.

Digitized by Google

4. The system as set out should be fairly immune from breakdowns. It has been the author's experience that faults do not often occur in the middle of lengths of armoured cable laid direct, but usually at points at which the cables have been worked, such as service T-boxes or joints.

5. By the use of armoured cables laid direct, a large proportion of unskilled labour can be used in the installation.

6. It gives the full capacity of the main in each house.

Apart from the question of supply to the new houses, the following points should be kept in mind in the design of the sub-station:—

1. Space should be left for spare H.T. cubicles so that in the future the H.T. supply can be extended further afield with a minimum expense and disturbance of existing arrangements.

The static sub-station which the author has in mind is one of several distribution points on a partly completed H.T. loop main. It is hoped eventually to complete this loop main back to the generating station through other distribution points so as to have a duplicate supply at each point. It would then be possible to cut out any one section of the loop and still supply at all points.

2. Space should be left either for increasing the size of the transformer or for putting in an additional one. The probable increase in the heating and cooking demand in the next few years is a debatable matter, but the least we can do is to allow for a substantial increase for these purposes.

3. Where old mains supplying adjoining districts run anywhere near the new sub-station they should be diverted into it where possible—even if they are direct current mains—as it may be desirable to take them over on to the new supply at some future date. In the author's own case, a three-wire D.C. distributor passes within 200 yards of the new sub-station, and this will probably be taken in and out of the sub-station with a view to changing over to an A.C. supply on account of increasing load and distance from the generating station.

It is suggested that the two D.C. "outers" up the road, and the two "outers" down the road will make four circuits which can be balanced up with the new houses on the 3-phase supply. The 3-phase voltage, one phase to neutral, is 230 volts with 400 volts between phases, while the D.C. voltage is 230 volts outer to neutral, and as the district in question is a residential one without large power consumers, it is hoped to accomplish the change-over without much disturbance other than the changing of the consumers' meters. It should be kept in mind that under modern conditions most power is generated as A.C., and if it can be distributed as such it saves loss both in conversion and distribution.

The cut-out box used in the houses replaces the ordinary cut-out and also the T-box used on the main, and must therefore be of special construction (fig. 2). The first batch of these had to be made during the moulders' strike, and consisted of rectangular boxes 15 in. by 7 in. by 4 in. deep, made of stout sheet iron and treated with a preservative paint. The front of the box is removable, and is made in two sections. The bottom of the box consists of a rectangular hardwood bush grooved on two sides so as to slip into the sheet metal box. This bush can be cut through the middle so that the front half can be slid in after the cables are in position. The bottom section of the metal front, which is 4 in. in height, forms the front of the sealing trough, and is held in position by two set-screws. It is not put in until the work on the cables is completed, so as to give every facility to the cable jointer when opening out the cables. The fittings in the cut-out box consist of two horizontal 1 in. by $\frac{1}{8}$ in. copper strips as shown, the top one being the live conductor, the lower one the neutral. The top bar is set 2 in. further back in the box than the bottom one, so that the conductors coming up to it shall clear the bottom bar. The bars are supported on hard-wood blocks, from which they are insulated by an ordinary meter board insulator and mica washers.

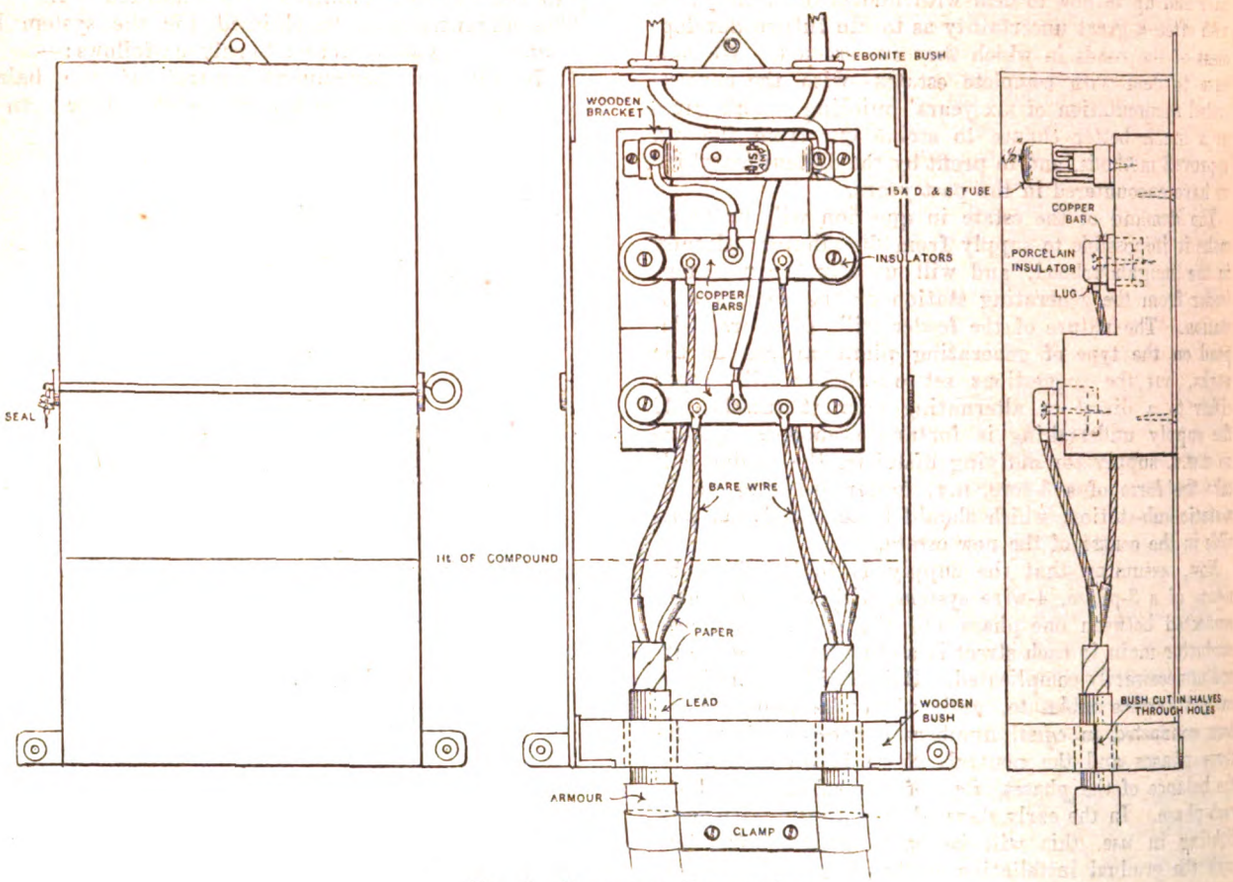

Fig. 2.—Details of Cut-out Box.

Each cut-out will take if necessary three .05 sq. in. twin cables, which permits of any cut-out being used practically as a three-way box. It is proposed to run all street lamp services from the nearest house by means of a .013 two-core paper, lead, armoured cable taken off the bars in the cut-out.

The lamp columns are of the usual type of small

Digitized by Google

column except that the bases for 18 in. above the ground are rectangular and are 12 in. by 10 in. The underground portion or root is made as a separate casting, and the column will be lifted on to this and secured by four bolts after the sealing ends and rubber tails have been put on the incoming cables. The bars in the lamp columns will be arranged and supported as in the consumers' cut-outs, and the feeder cables will run with the distributors on to these bars. There will be no fuses other than those on each phase in the sub-station, it being the author's experience that fuses in distribution boxes, unless under constant inspection, have to be set at such a high value to avoid overheating, that they seldom operate satisfactorily when required, and if set only slightly above the working current they are very likely to operate through overload and age, when not required to do so.

All cables will be carefully labelled at the start by means of a stamped zinc label attached to the rubber tails below the bars, and a tracing showing position of all feeders and distributors on the estate will be framed and hung up ready for reference, in the sub-station.

As previously stated, spare ways will be left in all feeder and distribution boxes so as to extend the feeders to the distribution boxes should the future developments require it.

Since writing the above, prices and particulars of a cut-out on the lines indicated for dipping cables in and out, have been received. These prices compare very satisfactorily with the combined cost of an ordinary cut-out and T-box, and the fact that a cut-out of this description will very shortly be on the market for immediate delivery in large quantities, should make the dipping-in system very popular with those responsible for the mains and services to the new housing schemes.

CHARGING ELECTRIC BATTERY HAND LAMPS.

By G. J. DUCKETT.

THE charging of electric battery hand lamps is usually done in a more or less happy-go-lucky way; users of lead-plate sulphuric-acid cells do not appreciate their delicacy, of which there is no gainsaying, but acid cells properly charged and used (that is, not allowed to stand discharged, when sulphation sets in and causes disintegration of the positive plates and swelling of the material, eventually bursting the celluloid case, and resulting in total destruction of the cell) are a most reliable type of electrical apparatus. The writer forsees a great future for the small-capacity electrical storage battery, and therefore a few remarks on the system of charging he has devised may be of some value to those who intend utilising electric lamps in lieu of the old-fashioned gas or oil hand lamps.

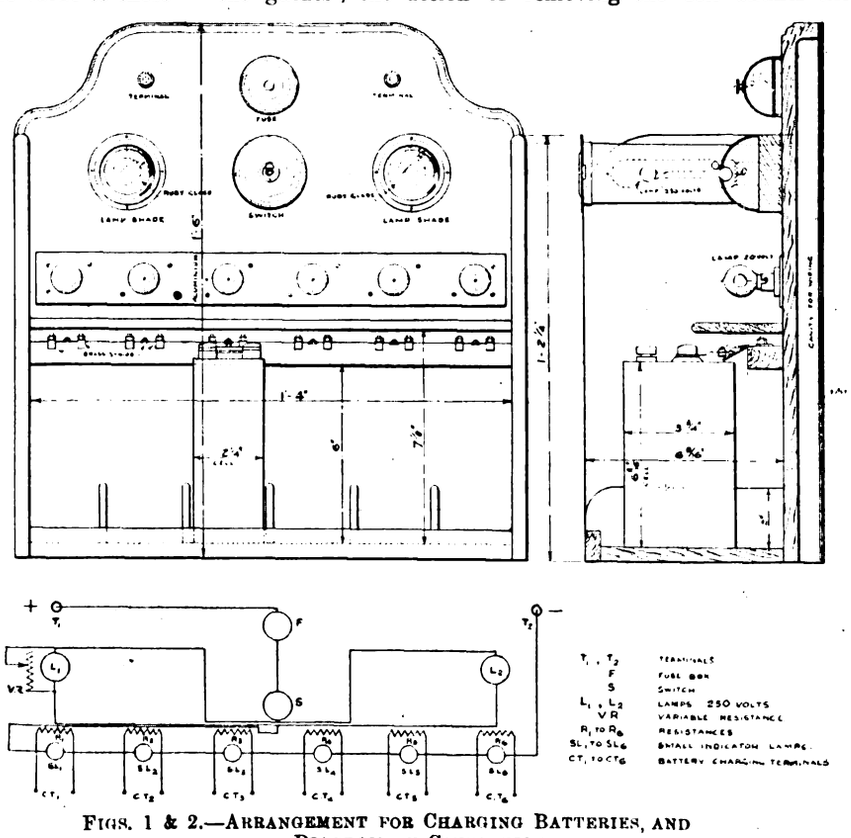
Many people have an unfounded horror of things electrical; owing to lack of instruction, or too great caution, they fight shy of any apparatus which looks electrical. I have borne this point in mind when devising a charging set which is capable of charging any number of cells up to six at one time.

Moreover, one or more cells can be taken off charge without interfering with the remainder, and it is not necessary to switch off the current for the purpose of putting on or taking off a cell, as there is no actual breaking of the circuit, and therefore no fusing of the contacts.

The potential difference between the battery-charging terminals is approximately 2·5 volts when the battery is on charge, but when the battery is taken off charge, the voltage immediately rises to 24, whereas under normal conditions the voltage across the terminals, when the battery has been taken off charge, would be equal to the voltage of the supply mains—in this particular case, 250 volts.

It is common knowledge that the gases given off the plates of accumulators when on charge, have, if combined with a certain amount of air, very explosive properties; therefore, it will be readily seen that if a cell is defective internally, that is, say, if a lug is broken away from the top of the plates, there is a tendency for high-voltage current when charging off 250-volt mains to pass across the gap at the break, and the voltage is sufficient to set up an arc of sufficient intensity to ignite the gases contained within the celluloid case. Such an explosion of the gases is, of course, ruinous to the battery. As I have mentioned before, the voltage across the battery in the arrangement I am describing cannot at any time exceed 24, therefore a break in the cell as above described will not ignite the gases contained within the cell, the voltage being insufficient to cause current to bridge the gap and set up arcing.

The sketch, fig. 1, shows a general view of the charging arrangement, which is capable of charging up six cells at a time, and fig. 2 shows the general wiring diagram. Say, for instance, that No. 4 cell is fully charged and is required, the cell is pulled forward and lifted out of the guides; the action of removing the cell shunts the main current through the 24-volt lamp immediately above the cell compartment, and it lights up, thus indicating that the cell compartment is empty.



FIGS. 1 & 2.—ARRANGEMENT FOR CHARGING BATTERIES, AND DIAGRAM OF CONNECTIONS.

It will now be seen that it is impossible to put a cell on charge inaccurately, and, therefore, it is not necessary to use pole-testing paper, &c., as is customary with the ordinary type of charging apparatus. If a cell is defective (say a broken lug internally), and is put on charge, the

Digitized by Google

defect is indicated by the illumination of the 24-volt lamp according to the internal resistance of the battery set up by the fracture in the lug. For instance, if the defect sets up a resistance which raises the battery terminal voltage to 12 or 15 volts, the indicator lamp will glow a dull red, which, of course, draws the operator's attention to the matter, and the battery is put on one side for inspection.

Although there is no necessity to touch any of the live parts of the apparatus, if by chance a pair of battery terminals are bridged across by hand, the potential difference between them is so small that even the slightest shock is very unlikely. Therefore, although at first sight the apparatus appears to consume more current than the ordinary series method, there is very little in it, the actual loss being ·004 unit per charge.

The cost of charging six 2-volt, 25-ampere-hour cells from a 250-volt main is as follows:—

250 volts × 25 ampere-hours = 6,250 watt-hours, or 6·25 units, which, at 2d. per unit, = 1s. ½d., or 2d. per cell, when six are on charge at one time.

The 24-volt indicator lamps and resistance consume 2 amperes at a terminal voltage of 24, therefore their resistance is 24/2 = 12 ohms, but when the cells are on charge the 24 volts are reduced to 2·0 volts, and, therefore, the current then flowing through this circuit is 2/12 = 0·16 ampere, or 0·16 × 2 = 0·32 watt, or for a complete charge it becomes 3·8, say, 4 watt hours, or 4/1,000 × 2 = 0·008d.

The principal claim put forward for this method of charging accumulators is that it is entirely foolproof, and the cells can be charged up by an inexperienced person; there is no technical process to go through, as it is only necessary to put the cells in the compartment if they require charging, and to pull them out of the compartment when fully charged. The best method of ascertaining when the cell is fully charged is to take the density of the electrolyte with the ordinary simple bulb hydrometer.

Fully charged cells should give a reading of 1·250 specific gravity.

THE I.E.E. (SCOTTISH CENTRE) VISIT TO KINLOCHLEVEN.

[BY OUR SPECIAL REPRESENTATIVE.]

On Thursday, June 10th, a party of members of the Institution of Electrical Engineers and their friends left Glasgow for a three days' tour in the Highlands. The excursion was the outcome of an invitation by Mr. W. Murray Morrison, general manager of the British Aluminium Co., to visit their works on Lock Leven.

The revival of interest in Scottish water power, the somewhat mysterious glamour which hangs over the processes of aluminium making, and the pleasant prospects of good company and glorious scenery all combined to lure about sixty members up into the North-West.

Going by the West Highland Railway, the journey led by mountain and loch and across the desolate Moor of Rannoch—where only startled herds of deer broke the empty solitude of the boulder-studded waste; then by tumbling rivers and fresh birchwoods to Fort William at the foot of snow-capped Ben Nevis.

Fort William.

Here the party was marshalled by Mr. William McWhirter for a tour of inspection of the local electricity works.*

The Fort William Electric Light Co.'s plant affords a pioneer example of highland town lighting by means of water power. The head of water is 100 ft., and two Gilbert Gilkes Vortex turbines, each of 100 H.P., drive a pair of General Electric Co.'s D.C. generators at 650 revs. per minute.

The main turbines are situated at Blamafoldoch, 2¾ miles across the hills from Fort William, and the energy, at 560 volts, is conveyed by bare overhead lines to a battery and distribution station in the centre of the town. The town station has, in addition to the battery, a small emergency water turbine and a 40-H.P. Hornsby oil engine, both arranged by belt to drive a battery-charging dynamo, the output of which is 70 amps. at 450 volts.

The standard lighting pressure in the town is 150 volts, and the power pressure is 300 volts. The battery is divided in the centre, with regulating cells at either end, and is charged as a single unit. The town station plant includes a small booster for regulating the pressure of a pair of feeders which go overhead to Corpach—a distance of about four miles.

Mr. McWhirter, while not responsible for the original lay-out of the scheme, has been superintending the supply for the last 20 years. Two typical examples of trouble peculiar to highland installations have been dealt with by him. One of these was frequent interruption by static discharge from the overhead mountain lines. This was effectively stopped by the fittings of non-gap carbon arresters connected to large earth plates.

* Described in the Electrical Review of March 5th, 1897.

The other annoyance was the pitting of the 25-in. steel pipe line at the turbines. The pitting was on the outer surface of the pipe, and was caused by the peaty water in which it lay. It has now been raised on piers to put it above the influence of the corrosive moisture.

The new diamond-cutting factory of Mr. Bernard Oppenheimer was also visited, this being now one of the chief power loads on the town supply. The factory is an offshoot from the larger one established at Brighton, and affords congenial work for disabled soldiers, who are pleasantly housed in the imposing hotel building adjoining. The processes of cutting, grinding, and polishing the stones were watched with interest. The mills and lathes are driven by five G.E.C. motors, having a total output of about 50 H.P.

The vibration caused by the high speed of the polishing disks, together with the need of individual lamps to light each mill, combined at first to produce a high mortality in filaments. It has been found, however, that Ediswan traction type lamps stand up to the severe conditions caused by vibration and constant handling.

Kinlochleven.

The visitors were up early on Friday morning for the 23-mile motor run to the head of Loch Leven. The journey, despite the qualms of those who occupied the seaward seats, was safely accomplished, and at eleven o'clock the party reached the strange town of Kinlochleven, which lies deep between the mountains.

After passing glens and caves, inhabited only by the ghosts of long dead clansmen, and having scanned miles of rocky coast line where not a smoke curl is visible, one experiences a shock on coming upon Kinlochleven, with its wharves and electric locomotives and its shops with wedding cakes advertised for sale. Kinlochleven is a fully equipped town with about 1,500 inhabitants, and while there are churches, schools, and a police office, the dominating feature is the power house with its impressive column of parallel pipes sloping up the hill side.

The power house is a spacious, well-lit, rectangular building having 11 large and two smaller turbine sets. Each set consists of a Pelton wheel turbine and two D.C. generators on one shaft.

The larger or main sets are used each for a battery of furnaces, and the smaller sets are for power, lighting and exciting.

Under the floor and along the length of the power house are a pair of aluminium busbars, which enable any set or group of sets to be coupled to any battery of furnaces.

The main turbines have a guaranteed efficiency of 80 per cent. each, developing 2,900 B.H.P. at a head of 900 ft. and at 300-400 revolutions per minute. They

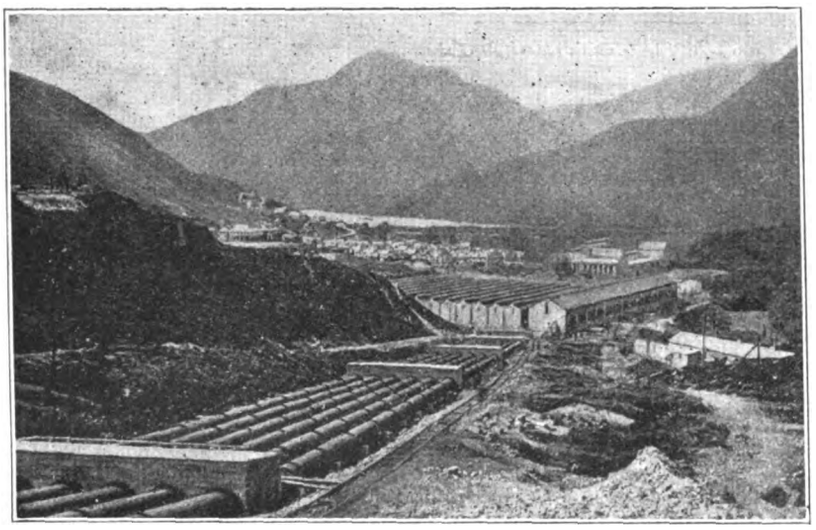
Digitized by Google

have two water jets, and on the majority of the machines the governors are of the hydraulic type, operating gun-metal spear-head valves. Two of the sets have oil-controlled governing gear; while these are more sensitive, they are also more complicated. The users appear to favour the more robust water governors for furnace work, where very fine voltage regulation is not essential.

The main generators are shunt-wound, without interpoles, and have slot-wound drum armatures. The two generators composing a set are connected in parallel, and the maximum output of each pair is 2,200 KW. at 275 volts D.C.

Electrical regulation is provided to prevent flashing over, which might occur through differences in the currents flowing in the two armatures on one shaft. The field circuits are separate up to their rheostats, but have a common return in which is placed the cut-out. The cut-out is operated by two solenoids. One pressure solenoid breaks the field circuit when the terminal voltage rises to 350, and the current solenoid is connected across the two leads of the same polarity on one pair of dynamos. It is adjusted in relation to the voltage solenoid so that an out-of-balance current short-circuits the field through a discharge resistance.

The two smaller turbine sets are of approximately half the capacity of the main furnace sets. While they also have two D.C. generators on one shaft, these are capable of being used as independent machines, each of different output and voltage. The two larger machines on each set are shunt-wound, and are used for lighting the factories and village and for supplying auxiliary motors, each single generator having a maximum output of 550 KW. at 275 volts. The other two generators are of the compound-wound traction type, having a maximum output of 94 KW. at 550 volts. These are employed to feed the electric locomotives and the cranes on the wharves. The main generators for furnaces, the supplementary sets, and also the locomotives are of Dick-Kerr manufacture. The turbines and their governing gear are by Escher, Wyss & Cie., except the latest addition to the main sets, where the turbine is of Gilbert Gilkes's make.



View of Kinlochleven Aluminium Works.

The extraction of aluminium provides an ideal load for a hydro-electric scheme, and the load at Kinlochleven is, approximately, 20,000 KW. continuously night and day.

The visitors were impressed by the cleanliness, the simplicity, the comparative quietness, and the even temperature of the power house. A peep through a window was permitted at the electric furnaces at work. In addition to the manufacture of aluminium, the company makes its own carbon electrodes in special furnaces. The connections between generators, furnaces, &c., and the overhead pole lines in the yards are of bare aluminium.

The Future of Scottsh Water Power.

After the inspection of the power house, the British Aluminium Co. entertained the party to luncheon at the Tartan Hotel. Mr. E. E. Eccles, the assistant general manager, formally welcomed the Institution representatives, and gave them some idea of the difficulties attending so unique an enterprise as the establishment of a great industrial community in the heart of the highlands. One realised that the present satisfactory position of the company, as well as being a victory over Nature, was also somewhat of a triumph over human nature. He urged on the visitors the need for developing more and more the resources of the Scottish Highlands, and hoped that they would use their influence to conserve the power which was running to waste and so give encouragement to the Highlander to remain among his native mountains.

Mr. W. B. Hird, the chairman of the I.E.E., Scottish Section, in reply, thanked the Aluminium Company and its staff for their welcome, and pointed out that during the last session much attention had been given by the Section to the question of the development of highland water power.

The Resident Manager, Mr. R. P. Tod, furnished some interesting facts as to costs and construction of the works, and mentioned that the factory had run without stoppage for the last 10 years. He announced the arrangements which had been made for the further entertainment and instruction of the company, and, as an incitement to effort, he indicated that a prize had been provided at the dam for the persons who got there first.

The Pipe Track.

The majority of the visitors then set out upon the serious business of the day—the exploration of the pipe track, the conduit, and the reservoir—and for the first part of the ascent many made use of the old road cut through the highlands by General Wade. By means of this road they reached the lower penstock-chamber, which is placed about 1¼ miles from the power-house. The level of the spillweir at this point is 977 ft., and the water here enters six welded steel pipes each of 39 in. diameter. The pipes are anchored to the hillside by massive concrete blocks, and go down to a pair of main bus-pipes to feed the turbines. As the turbine level is 42 ft., the net static head is 935 ft. or 406 lb. per sq. in. Air and scour-valves are fitted to the pipes. Muff joints are used except at anchor blocks, where flanges are employed.

The Conduit.

To the lower penstock-chamber, from which the steel pipes slope steeply down to the power-house, the water is led in a covered concrete box conduit from the reservoir. The conduit is 3½ miles in length, and runs along the southern side of the Leven valley. The conduit slope is only 1 in 1,000. The conduit measures 8 ft. by 8 ft. inside, and normally there is 2 ft. from the surface of the water to the cover of the conduit. The sides of the conduit are reinforced with expanded metal, and the inside floor is faced with a smooth granolithic skin. Expansion joints occur at 64-foot intervals along the straight portions of the wall. These are formed with an asphalt dowel and double bitumen strips. On the cover of the conduit the bitumen joints are replaced by slabs of timber.

The party, considerably thinned out, both as a party and individually, walked along the top of the conduit to the dam, and the course lay over arched gulleys and chasms and under precipitous rocks. On the right towered the mountain side, with here and there an in-

Digitized by Google

take pipe from some upper lochan, and on the left far below was the gorge cut by the River Blackwater.

The Dam.

The first sight of the dam is impressive. The upper part of the valley is blocked off by this great wall, measuring 86 ft. high at some parts and with a straight skyline of 3,112 ft. The top of the dam is 1,068 ft. above sea level, and it holds in check a loch reservoir over seven miles long and half a mile wide. The catchment area from which the water is collected is 55 sq. miles, and the reservoir holds more than 20,000 million gallons of water. The average annual rainfall over the catchment area is about 70 in. The dam is bedded everywhere on solid rock. The top thickness is 10 ft., and the upper face is plumb for the first 40 ft., when there is a batter of 1 in 20 to the base. At the base the dam is 60 ft. from back to front at some parts. At the centre of the dam is the valve tower; the valves control three 40-in. diameter pipes. The difference between the levels of these three intake valves and the six pipe valves at the power-house is 993 ft.

Mr. Hird had the energy and the honour to arrive first at the valve tower, and there for a little time he held a reception of the wayfarers as they came straggling up to inspect the tower and its interesting contents.

It was noted that the war had made a considerable demand on the resources of the whole scheme. Advantage has been taken of the presence of a band of German prisoners to connect up Loch Eilde Mor with the reservoir. This has been done by means of concrete pipes and 4 ft. 6 in. bore which were made in Kinlochleven, and stretch for a length of some four miles along the hillside on the opposite side of the valley to that of the main conduit track.

The Finish.

On leaving the dam several took the old bridle path down by the rocky bed of the Blackwater back to the town of Kinlochleven. After dinner those who had not elected to stay the night at Kinlochleven motored back to Fort William.

Saturday forenoon was spent in visiting local beauty spots, in which this district abounds, and while some were left to climb Ben Nevis or go further afield, the tour officially ended with the departure of the noonday train for Glasgow.

The arrangements for this thoroughly enjoyable excursion were chiefly in the hands of the Scottish I.E.E. Hon. Secretary, Mr. Joseph Taylor, and those of Mr. Thomson, of the British Aluminium Co. Perfect weather and the hospitable services of the ladies and the staff at Kinlochleven did much to make the visit a delightful memory.

D. S. M.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

New Cooking Apparatus.

Among the latest products of the British Electric Transformer Co., Ltd., 50, Oxford Street, W. 1, are the ovens and boiling table illustrated in fig. 1 and the plate heating cupboard shown in fig. 2. The boiling table measures 6 ft. 2 in. by 2 ft. 2 in., and has eight "hot spots"—four with 1-kw. loadings and four having 1.5-kw. loadings—each controlled by a heat regulating switch. The top and legs are of cast iron. Fig. 1 shows four ovens with hot shelves between the two sets, and at the top. The total maximum loading is 1,500 watts controlled by switches designed to put in various combinations of the heating elements. The cupboard (fig. 2) is of oak, and measures 2¼ ft. by 1½ ft. by 2 ft. 10 in. It is divided into two compartments having drop doors fitted with nickel-plated handles and tops—the latter being utilised as hot plates. The interior is lined with aluminium lagged with asbestos. The total maximum loading is 1 kw. Racks to hold 22 plates may be fitted or the cabinet may be used for keeping food warm.

House Lighting Plant.

Messrs. Mark Webber, Ltd., Church Acre Works, Guildford, have sent us particulars of an efficient and economical single cylinder petrol engine suitable for supplying lighting and power to a country house. The "Webber" engine, which is illustrated in fig. 3, possesses many good points, among which may be included the low fuel consumption which is obtained by a number of devices. The piston friction is reduced by the use of a slipper piston, and the crankshaft is mounted on ball-bearings. Forced lubrication of the big end is made by an oscillating plunger pump without the use of pipe work, the oil being delivered through the plunger itself. The camshaft and cams and bearings are contained in a trough which is filled with oil flung out from the big end, and are consequently always immersed. The overflow from this trough feeds the timing gears and governor. The use of very light reciprocating parts eliminates a great deal of vibration. The magneto is operated by a chain drive, and the chain runs in an oil bath. Cooling water is applied direct

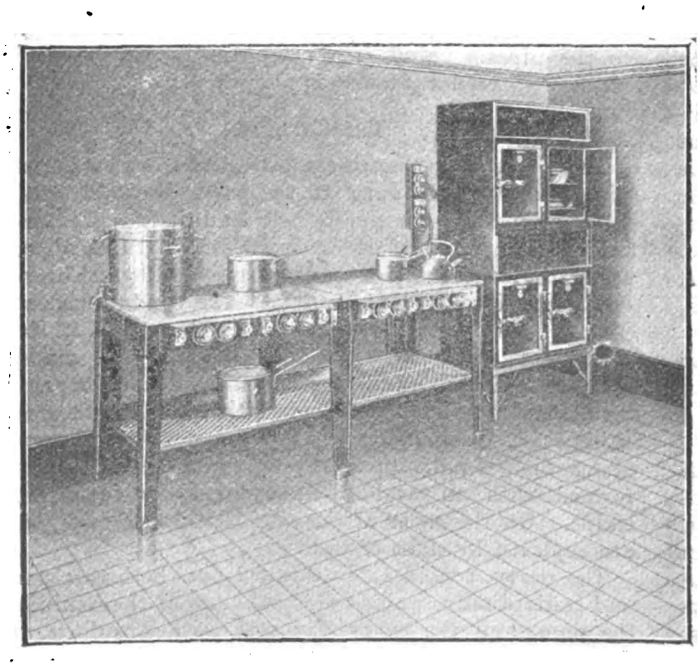


Fig. 1.—Boiling Table and Ovens.

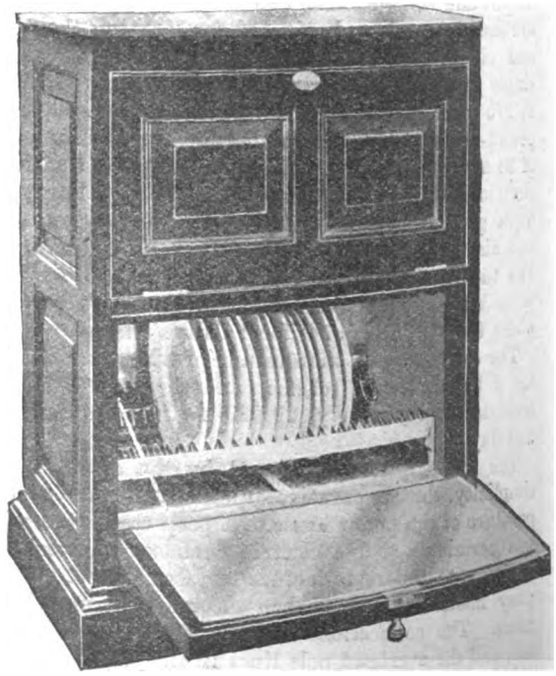

Fig. 2.—Oak Plate-heating Cupboard.

Digitized by Google

to valve seats where it is most needed, and all working parts are easy of access. The dynamo can be coupled direct to the shaft of the engine, and fixed on the same bedplate. The fuel consumption of this engine when running on petrol is about .6 pint per B.H.P.-hour, and the lubricating oil required is

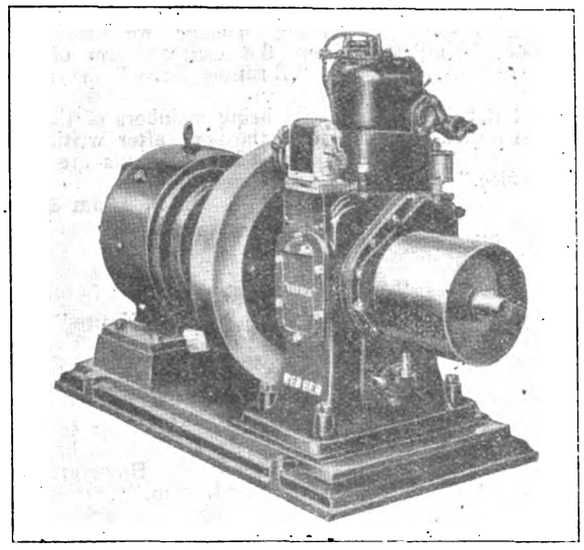

FIG. 3.—THE "WEBBER" ENGINE.

.012 pint per B.H.P.-hour. The size of the lighting sets ranges from 2 to 16 B.H.P., or from 1 to 9 KW. These machines can be adapted to run on gas or paraffin by making the necessary alterations in valves and ignition.

New Wiring Devices.

MR. H. WHITE, A.M.I.E.E., 1, Cumberland Street, Deansgate, Manchester, has sent us details of some new wiring devices he has recently designed. One of these, a "Universal" connector box, is shown diagrammatically in fig. 5. By means of this it is possible to obtain any combination of ways for two or three or four wires while ensuring that no other openings are left in the box. The object is attained by dividing the circumference of the box into sixteen equal parts, slots being cut at 1, 3, 4, 5, 6, 7, 9, 11, 13, 14 and 16 as shown in the diagram. A tight-fitting lid has four openings at

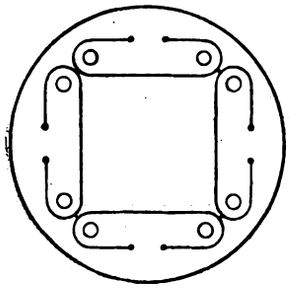

FIG. 4.—BONDING CLAMP.

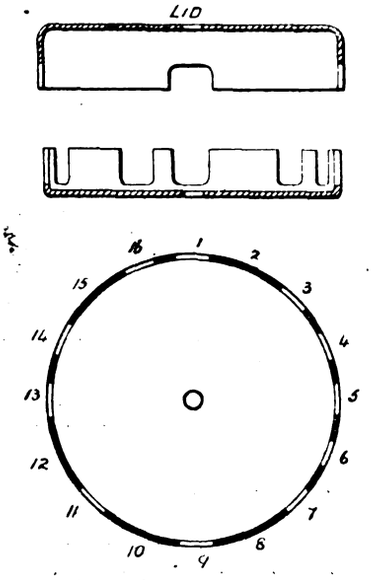

FIG. 5.—"UNIVERSAL" CONNECTOR BOX.

90 deg. By revolving the box it is then possible to obtain any combination desired (4-way, tee, straight through or right angle) only the openings to be used coinciding with the slots in the lid. Another device is shown in fig. 4. This is a circular piece of metal, fitting into the connector box, with four strips for binding over the cables, thus forming an efficient "universal" bonding clamp and ensuring electrical continuity in the sheathing of the wires.

LEGAL.

STOBIE *v.* NEWCASTLE-ON-TYNE ELECTRIC SUPPLY CO.

THE action brought by Mr. Victor Stobie, carrying on business as the Stobie Steel Co. at Dunston-on-Tyne, in the County of Durham, against the Newcastle-on-Tyne Electric Supply Co. came before Mr. Justice Peterson in the Chancery Division upon an adjourned summons on June 8th, and was continued on subsequent days.

Mr. TOMLIN, K.C., appearing for the defendant company (the Electric Supply Co.), said that the summons had been issued to determine a question that had arisen in taking an account directed by a judgment of his Lordship on April 30th last year.* The account ordered was one relating to the profits made by Mr. Stobie in his business, his Lordship having held that under certain agreements the defendants were entitled to share in those profits. The matter went before the Master in Chambers, when Mr. Stobie produced two balance sheets of profit and loss. A question then arose which the Master was not in a position to determine, in consequence of which this summons was issued. It asked for a declaration that new works established by the plaintiff adjacent to the works at Dunston-on-Tyne formed part of the assets of the Stobie Steel Co., and were not the property to which the plaintiff was beneficially entitled, and that the business carried on by the plaintiff at the new works under the title of the Stobie Construction Co. formed part of the business of the Stobie Steel Co. and that accounts be ordered upon the footing of such declaration. Counsel contended that defendants were entitled to a share in the profits of the Stobie Steel Co. under agreements which he read, and said that since his Lordship's judgment Mr. Stobie had adopted the name of Stobie Construction Co. in relation to the new works with a view to excluding the Newcastle Electric Supply Co. from their share of the profits from this undertaking. It appeared that in June 1917, there were for sale certain works adjoining the works of the Stobie Steel Works at Dunston. These were known as the Bradley Williams Works, which were used for the treatment of ore. Mr. Stobie went to the committee with a proposal that these works, which were then in the market, should be purchased. The committee asked Mr. Stobie to get out an estimate for purchasing and equipping them. What Mr. Stobie proposed was to set up there an electric furnace plant for the manufacture of white pig iron. At the next meeting of the committee on June 20th Mr. Stobie reported that he had bought the Bradley Williams Works for £2,000, and that he proposed to instal a furnace for the manufacture of pig iron and after the war to install cogging or rolling plant. Cogging or rolling plant was acquired for converting steel ingots into billets. The Stobie Steel Co. had not at the time on their works any cogging and rolling plant, and they sold their steel in ingots or got it converted into billets by outside firms. The installation of a cogging and rolling plant would therefore be of great service to the Stobie Steel Co. Mr. Stobie's estimate of equipping the Bradley Williams Works with the necessary machinery was £3,000, and the committee agreed that the matter should go forward on these lines.

Mr. UPJOHN, K.C., counsel for the plaintiff, said that the functions of the committee had come to an end at this time, and they had no power to authorise anything.

Mr. TOMLIN said that whether there was a formal authorisation by the committee or whether the committee had any express power to authorise or not there was no doubt that what Mr. Stobie contemplated was submitted by him to the committee for approval. He further contended that the business established at the Bradley Williams Works was part of the Stobie Steel Works, and was administered by one staff, the employés being paid by one official.

The hearing was adjourned.

On resuming on June 9th, Mr. TOMLIN continued his opening for the Electric Supply Co., referring to numerous books, documents and accounts in proof of the business relationship between the parties.

Mr. UPJOHN contended that the two businesses were distinct, and read an affidavit of Mr. Victor Stobie which stated that from 1906 thenceforward he carried on at Sheffield the business of designing and building works and plant such as steel-smelting furnaces and colliery plant manufactured in accordance with several inventions made by him and protected by letters patent. He was also a consultant in metallurgy, and such business he referred to as his construction business. This included the purchase of steel plates and other sections of constructional steel and the cutting, proving and riveting together of such steel to form furnace and other works plant, purchasing motors, transformers and other electrical apparatus. The business carried on under the style of the Stobie Steel Co. mentioned in the agreements in this case was a business entirely different and distinct from his construction business. It consisted of the purchase of steel scrap and ferro-alloys and the melting by means of electricity of such scrap and alloys into a liquid form in a chemically controlled bath and the casting of the liquid steel into the form of ingots to be sold to manufacturers. It did not comprise any constructional work. It was not true that his constructional business was in any way a part or an extension of that carried on under the name of the Stobie Steel Co. It had become

* ELECTRICAL REVIEW, May 9th, 1919.

Digitized by Google

very difficult in consequence of the war to get regular supplies of scrap steel, ferro-alloys and other materials for the steel works, and it was necessary to acquire and store a large amount of them. There was not sufficient space at the steel works to store this material, and before he was able to restore his construction business be permitted, as a temporary expedient, the storage of scrap steel in considerable quantities at the new works. In 1918 he commenced to fit up the new works with plant and with his own Stobie electric furnaces. The business carried on there occupied exclusively about three-quarters of the works, and he carried on the construction business there under the style of the Stobie Metallurgic Construction Co. For the purpose of his construction business he had taken over from the steel works goods at the price at which they were sold in the ordinary course of business, the cost of such goods being debited and credited in the books of the two companies. That had also been done when men had been engaged in either business while in the employ of the other. There had been no community of business as between the steel works and the Bradley Williams Works.

Mr. R. P. Sloan, director and manager of the defendant company, gave evidence in support of the defendant's case to the effect that there was ample room on the site of the Stobie Steel Works to store the scrap metal required, and said that to the best of his recollection the Control Committee of the Stobie Steel Co. approved of the purchase of the new works, the object of which was to extend the steel works.

The hearing was continued on June 10th, when further evidence was given to prove that the new works were carried out for the Stobie Steel Co., who had been debited with the charges for materials and labour.

The evidence of other witnesses was taken on June 11th, when the hearing was adjourned until June 16th.

(*To be continued.*)

Morrow *v.* Stepney Corporation.

In the Chancery Division, on June 9th and 10th, Mr. Justice P. O. Lawrence was engaged in hearing an action against the Stepney Corporation to restrain them from causing a nuisance by smoke, &c., from their electric power station at Limehouse.

Mr. Owen Thompson, K.C., and Mr. R. S. Northcote were counsel for the plaintiff, and Mr. Jenkins, K.C., with Mr. J. E. Harman, appeared for the defendants.

The plaintiff carried on the business of a mast, oar, and scull maker in Brightlingsea Place, Limehouse. His premises consisted of a workshop, a dwelling house, and a timber yard, which were opposite to the defendants' power station. His allegation was that the grit and ashes from the works caused him and his family great discomfort, and created an intolerable nuisance, and he asked for an injunction to restrain the Corporation from continuing to discharge grit and ashes from the chimney stack of the works. At the defendants' works there were 13 boilers, nine of which were generally in use, and eight or nine chimney shafts about 80 ft. in height. They consumed about 40,000 tons of coal a year, and they supplied about two square miles with electricity, and had some 3,800 customers for electric light or power.

Mr. Justice P. O. Lawrence, after hearing evidence and the arguments of counsel, in giving judgment, said that, in his opinion, the plaintiff and his witnesses had given their evidence very fairly and without exaggeration, and he (plaintiff) had proved to his satisfaction that the effect of the grit and ashes from the defendants' chimneys deposited upon his premises was to block the gutters and stack pipes on his workshop and to cause the premises to be flooded when it rained. Further, the gritty deposits penetrated the cracks in the timber in his yard with the result that when he worked at the timber the edges of his tools were blunted. Plaintiff also showed that his dwelling house was rendered so uncomfortable by the gritty dust and ashes which fell on the beds and clothing that he was justified in moving to another house. The evidence, said his Lordship, proved conclusively the extent of the deposit, and it satisfied him beyond doubt that the discharge from the chimneys of the defendants' works had rendered the plaintiff's premises less suitable for business and residence. The defendants said that there had been delay in bringing the action. In one sense there had been some delay, but it was to the credit of the plaintiff that he had not taken steps to stop the nuisance until it became intolerable. No exceptional circumstances had been proved by the defendants to induce the Court to exercise its judicial discretion to award damages in lieu of an injunction. The plaintiff was therefore entitled to an injunction which would be suspended for a short period to give the defendants time to abate the nuisance. No special damages had been proved, but he thought he was justified in granting plaintiff £50 as general damages for the discomfort which he had suffered, with the costs of the action.

It was subsequently arranged that the injunction should be suspended until November 12th next.

Buenos Aires Port and City Tramways.

In the Chancery Division, on Monday, Mr. Justice Eve sanctioned a scheme for the reorganisation of this company and an agreement giving effect thereto.

CORRESPONDENCE.

Letters received by us after 5 P.M. on Tuesday cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

German Representation.

Judging by the name on the envelope, we also have received one of the letters from the German firm of meter makers referred to in your "Business Notes" in your last issue.

We did not open it, but—not being members of the Newport Corporation—replaced it in the post, after writing over our signature "No letters received from Huns are opened in this office."

E. P. Allam & Co.

London.
June 12th, 1920.

"Situations Vacant."

I feel very grateful to you for the "Special Notice" in this week's Electrical Review re situations vacant, and hope that your kind offer will be accepted by all advertisers of vacant situations. Personally, I have during the last six months replied to no less than 50 advertisements in the Review; one of the applications resulted in an interview, about five employers had the courtesy to inform me that the position had been filled, the rest made no response whatever. However, I still hope to be successful in obtaining a situation.

X.

June 12th, 1920.

We are very interested in your "Appointments Filled" column, which we think is a step in the right direction; but we have a better suggestion to make to solve the difficulty, and that is to recommend that everyone applying for a job should religiously eschew answering advertisements under box numbers; it is little short of an anonymous letter. The writer's policy with letters of that sort is to put them in the waste-paper basket, and he would treat advertisements under box numbers in the same way. Surely we are British enough to be able to trust each other when a berth is advertised, and when an honourable application is made for the same.

J. Delebecque, *Works Manager.*

Walsall,
June 12th, 1920.

"What is the Contractor Doing?"

Some of the remarks made by your contributor in your issue of June 4th are quite correct, in my opinion. The electrical contractor certainly *does* need to wake up; at the same time the electrical manufacturer has not done all that he could. For instance, take the leading electrical manufacturers' lists of cooking and heating appliances, and you will find in most instances that:—

1. The actual current consumption of the apparatus is carefully left out.

2. There are no details as to the length of time necessary to do the work required.

If these details are not given in the makers' catalogues, they should be prepared to supply the contractor with suitable circular letters in which full details *are* given.

The current consumption should be stated in language easily understood by non-technical persons. Instead of saying 750 watts, why not state that "the current consumption is three-quarters of a unit per hour?"

I am afraid that the average electrical contractor has not the time or patience to prepare suitable circular letters advertising cooking appliances, although the value of these goods is now becoming well known.

With gas at its present high price and low quality, electric cooking should experience a great boom, and I think it is up to the manufacturer to help this forward without relying too much upon the contractor. When the contractor sees that it is worth while, he will do all that is necessary with regard to stocks.

Electra.

June 8th, 1920.

The Chief and the Staff.

In a few days the I.M.E.A. Convention will meet, and it would be well that the members present should take this particular gathering very seriously, for it is certain that there will be much talk and more thought over that very ominous word "Schedule." First, engineers as agents of employers should remember that employés lose public sympathy when *they* fail to stand by any agreement between masters and men! very well, so also will the *employers* lose public sympathy when they fail to carry out a joint agreement between masters and men. Secondly, engineers never have appreciated their own value because they have been too selfish, and in years gone by, having got on a little way themselves, refused to allow their unfortunate juniors to do likewise; they

Digitized by Google

neither valued their own brains nor other men's, until now engineers' brains are counted of no value at all in the commercial world. It is perfectly true that you cannot damn another's career without doing damage to your own; nor can one keep a slave without becoming a slave also. Chief engineers are in lots of cases finding this out. Their status is low, wholly because they set out with the object of making their subordinates' status low. The engineer has been a fool, and instead of the elder brother helping the younger, he has trodden on him; now the worm has turned, and the tragedy is that the reformation of status and conditions of labour has come from the lowest rung of the ladder, instead of coming down from the top, as it ought to have done. Now, of course, unless the engineers are still fools they will press the claims of the junior and thus their own status will improve, if they have the influence that is claimed, and all without any effort on their part. If not, then they will have a taste of their own medicine, that is, receive little more than their assistants, as they made their assistants receive little more and often less than the labourers. I should suggest that engineer members talk the matter over very seriously before any such expression as "ridiculous" is used with reference to the schedule of the National Joint Board; pre-war values were neither right nor reasonable. This schedule represents only a small per cent. advance on the real pre-war value, the just value of a man's brain and knowledge. To say that it was then a case of "supply and demand" justifies any extreme demand that employés may now make. Employers made a moral principle which it is not logical for them to alter and whine over because it is against them now. It is a law of nature that if you injure others you injure yourself, and all the talk in the world will not make right for one wrong for the other. If an undertaking cannot stand the charges and make a profit, then the charges must be raised until they do; I have yet to hear of the chief engineer who considered the profits of his undertaking when urging his own claims. There is no justification for a commercial undertaking to pay top price for manual labour and squeeze the technical man on such a plea. The engineer has been cheap, and now is an opportune time if only all will pull together to make the non-technical man understand that the electrical supply engineers consider themselves of some value which has to be paid for; but if we have amongst us at the top men who have no use for any other pronoun besides "I," then harm must be done. At present the technical worker is not prepared to throw in his lot completely with the manual worker, though there is a struggle at present to induce him to do so. I only hope that it will not prove that any member of the I.M.E.A. has it in his mind to be one of the means to bring this about at once, or he may live to reap the bitter fruit of his thoughts. We are all members of one grand profession; some day others will follow you. It depends on you *now* whether you will be honoured as a credit to a noble calling or despised as a hindrance to the attainment of its proper dignity.

A Technical Worker.

June 8th, 1920.

Non-Union Labour and Supply Undertakings.

At a meeting of District Council, Area No. 10 (Greater London), for the electricity supply industry, the question of connecting-up jobs or work done by non-union labour to the supply undertakings mains was discussed at very great length. No agreement was reached on the matter, but the following resolution was passed unanimously by the employés' side:—

"That the trade unions' side of District Council for Area No. 10, for the electricity supply industry, decide that on and after July 1st, instructions will be issued to their members that they are not to connect up any jobs or work done by non-union labour or scab labour in the area covered by this District Council."

In addition, the consent of the various executives of the unions concerned has been asked for, for permission to cease work on July 1st against any or all non-union labour employed in all or every electricity undertaking in the area covered by District Council No. 10.

W. J. Webb,

London District Secretary of the E.T.U. and Secretary for the employés' side of District Council, Area No. 10, for the Electricity Supply Industry.

London,
June 14th, 1920.

Fault Localisation.

Having read with great interest the article in the REVIEW of May 28th on "Cable Fault Localisation," by Mr. Raymond-Barker, also "Kon Denser's" letter in the issue of May 7th, it might interest your correspondents to know that the writer had a similar experience some years ago.

A high-tension, 3-phase, 3-core cable about two miles in length developed an open circuit on one line. Tests for insulation resistance between conductors and also between each line and earth gave no clue, so the writer suggested a capacity test.

A tangent galvanometer was used, and the cable charged from a 500-volt circuit, each line separately. The conductors were discharged through the galvanometer, and deflections of the needle were noted. The faulty line gave half the deflection given by each good line, both of which gave equal throws. The test was then repeated under identical conditions but from the other end of the cable, with the same result as before. Since the cable was uniform throughout its length and the lead sheath continuous and efficiently earthed, it was assumed that the galvanometer deflections would be proportional to the length of the cable. The nearest joint-box to the middle of the cable length was broken down, and it was found that one line had open-circuited at the sleeve joint in this box and the other two were almost separated but still making metallic contact with the other half of the cable. In this case the faulty line was well insulated at the break, the compound having sealed the ends.

June 7th, 1920.

Composition v. Porcelain Insulators.

In your issue of June 4th, Mr. Geo. V. Twiss, M.I.E.E., writes to find fault with a brochure we have recently issued dealing with "Telenduron" insulators.

Perhaps we have failed to make sufficiently clear that "Telenduron" is manufactured to different specifications to suit the special requirements of different articles. For "Telenduron" as used for telegraph and telephone insulators supplied by us to the G.P.O., we claim:—

1. That it is less brittle than porcelain.
2. That while ordinary commercial porcelain to some extent depends upon its glaze for its insulation, in the case of "Telenduron" the surface finish is of no importance.
3. That its electrical properties as substantiated by N.P.L. reports are ample for all ordinary low-voltage requirements.

For high-voltage transmission we manufacture "Telenduron" to other specifications to suit the special requirements of the consulting electrical engineer.

"Telenduron" is more durable than porcelain. While, like porcelain, it does not incorporate vegetable and animal substances, but is made from "rocks of the earth itself"—to quote Mr. Twiss—it also stands knocking about—which porcelain does not.

per pro **Thomas De La Rue & Co., Ltd.,**
H. C. PARKER, A.M.I.E.E.,
Manager.

Walthamstow,
June 15th, 1920.

COMPOSITION *v.* PORCELAIN INSULATORS.—CORRECTION.—A serious printer's error occurred in the schedule given in the letter of Mr. G. V. Twiss on this subject, in our issue of June 4th. The Schedule should read:—

	Telenduron.	Porcelain.
Flash-over voltage, dry...	40 K.V.	40 K.V.
Puncture voltage ...	25 K.V.	At least 75 K.V.
Absorption	'1 to '3%	Immeasurably small. Certainly below '01%

Recent Magneto Improvements.—Recent improvements in magneto design have much reduced the minimum speed at which the magneto will produce regularly sparks of some given intensity. A certain four-cylinder magneto, for example, will spark regularly across a 5.5 mm. three-point gap at about 60 R.P.M. with the timing lever fully advanced. This type of machine has been found to give good starting on a 3-ton lorry engine, which was always difficult to start with the much larger type of magneto (of older pattern) that it displaced.

This, however, according to Messrs. A. P. Young and H. Warren, *Procs. Inst. of Automobile Engineers*, is not enough; and as an alternative to the complicated and costly electric starter, what is called by Americans an "impulse starter," opens up large possibilities. This device is designed to take the place of the ordinary coupling. It comprises, in essence, two members, one of which is rigidly secured to the magneto-spindle and linked to the other, which is attached to the driving spindle by a stout helical spring. When the crankshaft is slowly rotated the two members will move together until a pawl carried by the member on the magneto spindle is held by a stop fixed to the frame of the magneto. Any further motion of the member on the driving spindle causes the spring to be wound up, during which time the armature remains stationary. After a definite movement of this member the pawl is released, and the armature then suddenly flicks over, producing during its rapid motion an intense spark. This is sufficient to start the engine, which rapidly accelerates. At a very low speed, the pawl is thrown out of action by centrifugal force, and the two members rotate as a single unit. As compared with an electric starting system, this device is naturally much cheaper, and, being a compact and single mechanical unit, it obviously has—other things being equal—enormous advantages from the standpoint of reliability.—*Technical Review.*

BUSINESS NOTES.

Notice to Readers.—As several correspondents have placed before us particulars of certain business transactions of a disappointing and unsatisfactory character relating to purchases of conduit, it is thought that there may be others who have been similarly inconvenienced. If so, will they communicate with the Editors of the ELECTRICAL REVIEW, 4, Ludgate Hill, E.C. 4.

Siemens Sports' Club.—The directors of Siemens Bros. and Co., Ltd., have presented to the Siemens's Sports Club, formed by the employés of the company at its Woolwich works, a football challenge shield for competition between the various departments. The presentation, which took place on May 28th, was made by two of the directors—the Rt. Hon. Sir William Bull, M.P., and Mr. G. Chauvin, managing director—who at the same time handed over a room for the accommodation of the club until such time as a suitable sports ground can be found. Sir William Bull congratulated the club upon its success in having over 1,300 members already enrolled. The first winner was the Apparatus Machine Shop, which thus heads the list of names to be engraved upon the shield.

The shield, which was designed and made at the Woolwich Works, possesses many unique and emblematic features. It is constructed in fine figured oak, upon which, carved in bas relief, are shown some of the products of the company, viz., overhead telegraph and power lines, an automatic telephone instrument, a searchlight projector and primary cells. The carving also includes a representation of the company's cableship *Faraday*, and of a deep sea grapnel, used for picking up submarine cable at great depths. Above the shield proper is a full size football in wrought copper, beneath which appears the Arms of the Borough of Woolwich. The shield is six feet in height, and is arranged for suspension by means of a suitable length of an actual cable which played no inconsiderable part in the successful defeat of the submarine menace in the late war, and which was manufactured at the Woolwich works.

Lead.—In their report dated June 12th, Messrs. James Forster & Co. give the following information :—

BOARD OF TRADE RETURNS.

	Tons.
The imports for June are given as	14,568
The exports for June are given as	3,317
Left for home absorption	11,251

The latter figure for the seven months November-May (inclusive) is 29,954 tons; against this we venture to give the following figures as a conservative estimate of consumption in the three principal trades, viz :—

	Pre-war. Tons.	This year. Tons.
White lead, red lead, &c.	60,000 ...	35,000
Electric cables and accumulators ...	60,000 ...	60,000
Sheet and pipe lead, &c.	— ...	50,000
		145,000

We have the white lead and sheet lead estimates from authorities in the trade. The second (electrical) is based on the fact that the cable companies report a record trade both in values and quantity.

On these figures (which we are certain are lower than the actual) we have a total consumption of 145,000 tons for the year, against imports available for seven months of 29,954 tons. So far the metal available in the ordinary way for the requirements of consumers has been supplemented by Government war stocks, and in some localities by supplies obtained from the dismantling of chemical plant erected by the Government for war purposes. These adventitious aids have so far tided over a difficult time, but we have to rely on imports, and if our figures for consumption could be cut down by one-half we should still be left with a considerable deficit, unless the coming months show a much larger increase in imports.

Manufacture of Meters in Australia.—According to Press reports just to hand, it was expected that early in July the Small Arms Factory, Lithgow, would commence the manufacture of all kinds of meters, for gas, water, and electricity. "At present there is no firm undertaking this work to any extent in Australia, and the only meters imported are Japanese, which are said to be very inferior in quality. Extreme difficulty is experienced by companies in securing supplies, and the factory management has already received an order from a Sydney firm for 3,000 meters."

Electrical Manufacturing Developments in Australia.—For manufacturing in Melbourne, Berry's Electrical "Magicoal" Fires (Australia), Ltd., has been registered, with authorised capital of £30,000, in 60,000 shares of £1 each. Messrs. H. H. Berry, G. C. Allan, W. Lowe, G. E. Dickenson, and S. G. Pirani constitute the first board. The office of the company is at 60, Queen Street.

Confirmation of the appointment of Mr. G. Weymouth, of G. Weymouth Proprietary, Ltd., Melbourne, and Messrs. J. B. Nicholson and A. A. Stewart as joint managing directors for five years of the English Electric Supply Co. of Australia, Ltd., was to be asked of shareholders in Standard Waygood Hercules, Ltd., Sydney, at a meeting on May 6th. G. Weymouth & Co., Pty., Ltd., lately acquired a large interest in Standard Waygood Hercules Co., Ltd., and the name of the latter is to be changed to English Electric Supply Co. of Australia, Ltd. The Standard Co. has issued its report for the year ended March 31st last, showing a net profit of £46,237, which compares with £16,993 for the previous year. It is proposed to pay a dividend of 10 per cent. per annum and a bonus of 2s. per share. Failing instructions to the contrary, the bonus will be applied towards paying up a new issue of 21,600 shares offered to present shareholders. The Brisbane business has been closed. An outlay of £150,000 is anticipated for extension of works, at which to carry on manufacturing in Australia for the English Electric Supply Co., Ltd.—*Sydney Sun*, April 22nd.

Applications for British Trade Marks.—Appended is a summary of the recent applications for British trade-marks in respect of goods associated with the electrical trades and industries :—

Karnak. No. 400,550. Class 13. Sparking plugs, electrical fittings, &c. Bernard A. Quick, 20, Gladstone Park Gardens, and Arthur R. Kearney, 6, Templars Avenue, Golders Green, London, N. February 9th, 1920.

Instanto. No. 401,272. Class 13. Sparking plugs. Sydney E. Taylor, Frederick O. Ellis, and George E. T. Archer, 307, London Road, Southend-on-Sea. February 27th, 1920.

B.M.T. British Motor Trading Corporation, Ltd. (lettering combined with wheel design). Electrical insulating materials, &c. British Motor Trading Corporation, Ltd., 20-22, King Street, St. James, London, S.W. May 26th, 1919.

Platomac. No. 402,366. Class 13. Sparking plugs. Pickhard, Dobson & Co., Ltd., 536, Claremont Road, Rusholme, Manchester. March 26th, 1920.

Thomson Electric Welding (lettering, combined with design). No. 391,280. Class 18. Electric plant for welding, forging, brazing, and soldering. Thomson Electric Welding Co., 84, State Street, Boston, U.S.A. May 95th, 1919.

Resilia. No. 400,077. Class 8. Electrical measuring instruments. Chas. E. Foster, trading as the Foster Instrument Co., Pixmore Avenue, Letchworth. February 27th, 1920.

New Lamps for Old. The Aladdin Renew Electric Lamp Corporation, Ltd. (lettering combined with design). No. 396,413. Class 13. Incandescent electric lamps (ordinary). The Aladdin Renew Electric Lamp Corporation, Ltd., Grosvenor Mansions, 82, Victoria Street, Westminster, S.W. October 23rd, 1919.

Kayb. No. 399,422. Class 13. Sparking plugs. Thos. Kay, trading as A. Kay & Co., Bolton Brass Works, Blackhorse Street, Bolton.

Reflex. No. 403,686. Class 13. Sparking plugs. The Reflex Ignition Co., 3068 West 106th Street, Cleveland, O., U.S.A. May 3rd, 1920.

Nonsol. No. 401,621. Class 40. Insulating tape principally composed of india-rubber. Connolly Bros. Adhesive Tapes and Insulating Materials Co., 69, St. Stephen Street, Salford, Manchester. March 9th, 1920.

Electrical Installations for Ontario.—H.M. Trade Commissioner at Toronto (Mr. F. W. Field) has informed the Department of Overseas Trade that the Hydroelectric Power Commission of Ontario has issued a notice to electrical manufacturers, jobbers, and dealers in Ontario to the effect that all electrical material, devices, and fittings for use on inside electrical installations in the Province of Ontario, must not be offered for sale until their design and construction has been approved by the Hydroelectric Power Commission of Ontario. (6 Geo. V, Chapter 19, 1916.) Manufacturers whose products are approved and listed by other recognised authorities, and which also meet the requirements of this Commission, may have same placed on the approval list by making application in accordance with Approval Laboratories' Bulletin No. 5, copies of which are on file with the Department of Overseas Trade.—*Board of Trade Journal.*

German Debts : Warning. — The Controller of the Clearing Office (Enemy Debts) desires to warn the public that attempts are being made by German agents or principals to obtain direct settlement or payment of their pre-war debts from their British debtors. By the terms of the Treaty of Peace Order, 1919, it is unlawful for any person to pay or to accept payment of a debt coming within the provisions of Article 296 of the Treaty of Versailles, and communication between the parties interested as debtor or creditor is forbidden. Any person contravening this provision is liable to be proceeded against and punished as if he had been guilty of the offence of trading with the enemy. Severe penalties are similarly imposed by German law on German nationals contravening this provision of the Treaty. Persons or firms to whom overtures have been, or may be, made for settlement of pre-war debts, except through the Clearing Office, are requested to immediately communicate full particulars to the Secretary of the Clearing Office (Enemy Debts), Cornwall House, Stamford Street, London, S.E.1. British nationals who are creditors of German nationals in respect of pre-war debts, and who have not yet notified their claims to the Clearing Office, should do so at once, in view of the fact that the time limit fixed by the Treaty for notification expires on July 10th, 1920. British nationals, to whom official applications have been sent by the Clearing Office for payment of all debts whether above or below £50 admitted to be due to German nationals, should pay these debts forthwith; failure to do so increases the interest chargeable against the debtor and exposes him to the risk of payments of law costs. British claims to the number of 34,802 were on the 15th ultimo notified to the German Clearing Office, and a further large number will be notified during the present month. As soon as the notification of the admission of these claims has been received from the German Clearing Office payment will be made by the Controller without further request by the British creditor.

Digitized by Google

Capital of Italian Electrical Companies.—The *Economic Review* reproduces from *L'Economista d'Italia* of May 23rd, the following table showing the amount of capital invested in electrical companies up to October 31st, 1919, according to statistics published by the Electrical Engineers' Association :—

	No. of companies	Capital in L.1,000
Piedmont	31	122,394.5
Lombardy	94	536,811.9
Venetia	24	120,268.0
Liguria	17	168,830.0
Emilia	8	26.7
Tuscany	22	132,494.7
The Marches	12	12,505.0
Umbria	3	1.9
Abruzzi and Molise	8	2,297.0
Campania	30	183,260.05
Puglia	12	8,454.0
Calabria	11	6,266.0
Sardinia	1	120.0
Sicily	9	18,430.7

Rubber-covered Wire: Conditions of Importation into Australia.—Rubber-covered wire imported into Australia must comply with the conditions set out in a proclamation issued in the Commonwealth on April 2nd, 1919. This proclamation, originally notified to operate from July 1st, 1919, was not actually enforced until April 1st, 1920.

We regret that we have not space to spare to print the full proclamation setting forth in detail the conditions and tests that have to be complied with, but these particulars can be obtained by those interested from the office of the official secretary, Australian Commonwealth Offices, Australia House, London, W.C. 2.

Since the issue of the proclamation the Commonwealth authorities have decided to accept compliance with the undermentioned conditions as a satisfactory alternative to compliance with the corresponding conditions specified in the proclamation, viz. :—

1. The insertion of a tape marked as required between the vulcanised tape and outer covering will be accepted in lieu of marking on the tape.

2. The requirements laid down in the British Engineering Standards Association, Report No. 7 of 1919, revised July, 1919, will be accepted for the respective grades of cable.

It is understood that rubber-covered wire purchased from the Disposal Board is being exported to Australia not marked as required by the proclamation. The High Commissioner for Australia has been asked by the Commonwealth Department of Trade and Customs to give publicity to the fact that it is not proposed to exempt such wire from the requirements in question.

Large British Water Turbines for Cauvery River Scheme.—The order has just been placed with Messrs. Boving & Co., Ltd., for four 5,600-H.P. turbines by the Mysore Government for the Cauvery river scheme. It is believed that these will be the largest Francis turbines ever built in this country, though Pelton wheels up to 8,000 H.P. have been built here, five of this size being supplied by Messrs. Boving & Co., Ltd., to the Tasmanian Government. The turbines now ordered by the Government of Mysore will be of the single discharge spiral type for a head of 415 ft., and will run at 500 R.P.M. In addition two Pelton wheels of 450 H.P. are required for driving the exciters. These new units form the first group of the large machines which are to replace the smaller machines now installed, in order to better utilise the power available.

Electrical and Engineering Wage Demands.—The *Manchester Daily Dispatch* states that a ballot is being taken among the 55,000 members of the Electrical Trades Union throughout the United Kingdom to decide whether, if necessary, they shall cease work in order to enforce a demand for a flat rate of half-a-crown an hour. The date for the return of the ballot papers has not yet been fixed, but it is anticipated that there will be a big majority in favour of steps being taken to secure the rate mentioned. Half-a-crown per hour, it is said, would mean an increase of 7d. for the men in the Manchester area, 3d. for those in London, a little over 4d. for those in Liverpool, and as much as 8d. for workers in Scotland and other parts. It is stated that before any notices are handed in the Union will make an offer to negotiate with the Electrical Trades Federation, the employers' body concerned.

The *Birmingham Post* reports that at a private meeting at Edinburgh of employers in the engineering trades the position brought about by the latest demands of the men for increased wages was considered, and it was decided to resist those demands. The men put their claims forward in the form of an ultimatum, giving the employers three weeks to decide. The employers' meeting was private, but it was decided that not another penny should be conceded to the men. The industry is now strained to the utmost to meet the concessions already granted, and when the three weeks have expired the men must either withdraw their demand or all engineering works will be closed down and hundreds of thousands of workers locked out. At the meeting practically every firm of consequence was represented.

State Industries in Germany.—The Exchange Telegraph correspondent at Berlin states that although the German Government has abandoned plans to nationalise whole branches of industry, and has substituted compulsory trusts, the State has of late taken into its hands a considerable number of important producing concerns. From the General Electricity Co. the State has purchased power works near Bitterfeld with a capacity of 100,000 KW., which supplies Berlin City. The State has taken over the brown coal mines in Niederlausitz, and is running the electrically-driven Lauta aluminium works, which also produce artificial nitre. A large number of other power stations have been taken over under the Electricity Law of 1919. The State is also largely engaged in nitre production by the Haber and Frank-Caro processes, and has control of almost the whole aluminium production, which is mainly an outcome of the Government's investment of 300,000,000 marks in 1915. The State has also taken over the important Ilseder smelting works in Hanover.

Wages in German Industries.—The *Wirtschaftliche Rundschau* (May 13th) has an article showing the extraordinary increase in wages in the various German industries in the past few years, from which it appears that the very high wages earned by individual categories during the war became general after the revolution. The result is that Germany's economic life is seriously imperilled, as may be gathered from the following statistics :—

In the Rhine Province and Westphalia the ratio of wages to every ton of crude steel produced rose from Mk. 16, at the beginning of 1914, to Mk. 208 in December, 1919, making a twelfold increase in wages alone. The wage advances in the war industries between July, 1914, and July, 1918, varied from 300 to 400 per cent. The wages of individual categories of workers reached a fabulous height. Apart from cases—by no means rare—in which, for example, a Berlin highly-skilled worker earned Mk. 980, in a 52-hour week, wages of Mk. 200 per week were not unusual; a skilled tinsmith earning less than Mk. 100 per week would have been looked for in vain in Berlin. In addition to the wages, war allowances and other benefits were received by the workers, which cost the undertakings considerable sums of money. After the revolution, the wave of wage-increases rose to an absolutely unprecedented height. According to the *Reichsarbeitsblatt*, the average daily wage of an industrial worker (juveniles included) rose from Mk. 5.18 in March, 1914, to Mk. 13.52 in March, 1919; that of a woman worker from Mk. 2.28 to Mk. 6, *i.e.*, an advance of 261.0 per cent. for the former, and of 263.2 per cent. for the latter.

The increase in the metal-working, engineering, and electrical industries is shown in the following table :—

	Average daily earnings in marks.						
	Mar. 1914.	Mar. 1915.	Mar. 1916.	Mar. 1917.	Mar. 1918.	Mar. 1919.	Inc. p.c.
(*a*) for male workers.							
Metal-working ...	5.54	6.29	7.46	9.88	12.61	14.13	155.1
Engineering ...	5.37	6.39	7.33	8.95	12.10	14.79	175.4
Electrical Industry	4.52	4.99	5.76	9.25	12.06	13.13	190.5
(*b*) for female workers.

Electrical Industry	2.75	3.01	3.91	5.24	6.58	7.96	189.5

—*Economic Review.*

Company Liquidations.—SURREY ELECTRICAL CO., LTD. Winding up voluntarily. Liquidator, Mr. E. W. E. Blandford, 227-8, Gresham House, Old Broad Street, E.C. 2.

KINETIC CO., LTD—A meeting of the creditors was called for June 16th, at 43, Gallowgate, Leicester, on June 16th. Liquidator, Mr. T. Rimington.

TORQUAY TRAMWAYS CONSTRUCTION SYNDICATE, LTD.—A meeting of members is called for July 12th, at 62 and 68, Queen Street, E.C., to hear an account of the winding up from the liquidator.

ALEXANDER DUCKHAM & CO., LTD.—Meeting called for July 19th, at 4, Broad Street Place, E.C., to hear an account of the winding-up from the liquidator, Mr. L. A. Anderson.

W. A. S. BENSON & CO., LTD., London.—This company is winding up voluntarily, with Mr. H. C. Rabbidge, 32, Poultry, E.C., as liquidator. Meeting of creditors, June 28th.

Trade Announcements.—MESSRS. TOFIELD & ROBINSON, LTD., of 165, Edmund Street (and Lionel Street), Birmingham, have recently purchased the Birmingham business of Messrs. Handley & Robinson, Ltd., of the same addresses. They have also acquired offices and stores in London. In addition to being contracting engineers, they hold a stock of A.C. and D.C. motors.

MR. BEN CROSLAND, electrical engineer and contractor, of Bradford Road, and 3, Branch Road, Batley (Yorks.), has been joined in partnership by Mr. H. Bateson, of Bradford, and the business will be conducted under the style of Crosland & Bateson.

MR. J. G. ROYCE, of 37, Victoria Street, Bristol, has been appointed by the Hart Accumulator Co., Ltd., of Stratford, London, as their agent for the sale of the "Hart" storage battery in the south-west district of England (the counties of Gloucester, Somerset, Devon, Cornwall and Dorset).

THE B.E. CO. (OF LONDON AND BIRMINGHAM), LTD., states that it is desirous of appointing agents for many parts of the United Kingdom.

THE BRITISH ELECTRIC TRANSFORMER CO., LTD., of "Tricity" Showrooms, Oxford Street, W.1, has had an additional telephone line installed ("Museum 5880") to cope with increased business.

Digitized by Google

The German Transmarine Electricity Co.—The shareholders in the Deutsch-Ueberseeische Elektrizitats Gesellschaft of Berlin have now approved the transfer of the undertaking to a Spanish group. At the recent meeting the chairman mentioned that offers had been received from countries of the Entente to take over the concern, and also from a Swiss group, but the most favourable proposal to the company was that made by the Spanish group of banks. The company realised net profits of 2,115,000 marks in 1919, as compared with 2,372,000 marks in the preceding year, and a dividend at the rate of 6 per cent. has been declared on the preference capital, as in 1918.

Catalogues Wanted.—MESSRS. STEEL MORRISON AND Co., Sprowston Works, Sprowston Road, Forest Gate, E. 7, electrical and general engineers, wish to receive catalogues and lists from electrical manufacturers and dealers.

MESSRS. BURRELL, RUSSELL & Co., 104, Shenley Road, Camberwell, S.E. 5, ask for manufacturers' catalogues of everything electrical suitable for contractors, also shafting.

Dissolution of Partnership.—BAKER & HYMAN, electrical manufacturers, automobile and general engineers, 11 and 13, Portland Crescent, Leeds.—Messrs. W. T. Baker, H. W. Baker, and H. Hyman have dissolved partnership. Messrs. W. T. Baker and H. Hyman will attend to debts and continue the business.

For Sale.—The Disposal Board, Ministry of Munitions, is offering for sale by tender the plant for the production of hydrogen and oxygen by electrolysis, situated at Grand Tuevilly, near Rouen. For full particulars see our advertisement pages to-day.

Manchester Corporation electricity department invites offers for 13,000 pairs of Columbia carbons, and 2,000 pairs Conradty carbons for open-type arc lamps. For particulars see our advertisement pages to-day.

Book Notices.—"Caledon Welfare Magazine." Vol. I, No. 1. (24 pp.) Price 6d. London: Industrial Welfare Society.—A new works journal just issued by the Caledon Shipbuilding Co. The first number includes, among notices of the many social activities of the firm, an article on the ethics of Sportsmanship, by Lieut.-Col. E. A. Berrisford, M.C., President of the Oxford University Boating Club, and a clever cartoon by Mr. Bert Thomas, caricaturing the suggestion that music might be introduced to accompany the more monotonous tasks in industry. There are other contributions on motor cycling, athletics, allotments, the effect of mechanical inventions on the working man and boy life in China, with two pages devoted specially to women. The magazine is well printed on good paper, amply illustrated, and neatly laid out.

"Safety First." The *Journal* of the British Industrial Safety First Association, No. 2. May, 1920. (16 pp.).—A report of the first annual general meeting and the first annual dinner is included in this issue. Other interesting items are notes on "Safety First," from a variety of sources, industrial and otherwise.

"Faraday House *Journal*. Vol. III. No. 6. (Summer Term, 1920). (18 pp.).—This issue includes an interesting and informative paper on "The Electrostatic Capacities of Cylindrical Conductors," by Dr. Alexander Russell (Principal), as well as an account of the annual dinner of the Old Students' Association. Lists of examination results and recent appointments secured by students are given.

Scientific Paper No. 378 of the U.S. Bureau of Standards, "A New Spectropyrheliometer and Measurements of the Component Radiations from the Sun and from a Quartz Mercury Vapour Lamp." Pp. 17. Washington: Government Printing Office. Price 5 cents.—The instrument described consists of a quartz spectrograph and cylindrical condensing lens, placed upon an equatorial mounting. In this manner the ultra-violet absorption in heliostat mirrors is avoided. Notes on the relative components of infra-red, visible and ultra-violet rays from the sun and from a quartz mercury arc lamp, are given.

"Elements of Electrotechnics." By A. P. Young. Pp. viii + 348; 179 figs. London: Sir I. Pitman & Sons. Price 7s. 6d. net.

"Steam Turbines." By J. A. Moyer. Pp. xi + 496; 222 figs. London: Chapman & Hall. Price 21s. net.

Bankruptcy Proceedings.—HORACE HENRY SHAVE (trading as H. H. Roberts), electrician, 228, Sultan Road, Portsmouth.—The public examination of this debtor was held at Portsmouth on June 7th. In answer to the interrogation of Mr. G. S. Hopkins, the Deputy Official Receiver, the debtor said he joined the Navy as a domestic in November, 1906, and left in March, 1908; he rejoined as officers' cook in December, 1913, and finally left in September, 1916, for medical reasons. He then travelled in the sale of enamelled letters, out of which he made a livelihood, until October, 1919, when he commenced trading on his own account as an electrician. He had had some experience in electfical work, having previously been employed in the telephone service. When he commenced on his own account he had no capital beyond £13 5s., the amount of his gratuity on leaving the Service. The six months which he had been in business had barely paid him a living profit, and in October he was obliged to suspend his operations, owing chiefly to the difficulty in getting the necessary tubing. He continued for some time after the knowledge of his insolvency, in the hope that matters would improve. He became aware of his insolvency about five weeks prior to filing his petition. He had kept no books of account of any description, and in applying for work he had underestimated the cost of it, and this had been one of the things which led to his failure. The liabilities amounted to about £85, and the assets were of the net value of £11, leaving a deficiency of £74. The examination was closed.

E. S. ELAM and J. WALTON (Elam, Walton & Co.), electricians, 63, King Edward Street, Kingston-upon-Hull.—Receiving order made June 8th. First meeting June 25th; public examination, July 12th.

GEORGE FREDERICK KIVERON, electrical engineer, Goulders Place, Attercliffe Common, Sheffield, late 38, Shrewsbury Road, Sheffield.—The public examination of this debtor was held on June 10th, at the County Court Hall, Bank Street, Sheffield. According to the statement of affairs submitted, his liabilities amounted to £664, and assets £330. Debtor stated he was Dutch, and came to this country in 1909, and set up business in 1918 after serving in the Army. His stock was supplied on credit, and the business was very successful at first. His business was so successful that at one time he had to employ nine men. Since July last, however, the business had not been so successful, and he had lost money on contracts. He had started books, but as he could not write English very well, he had got mixed up. The examination was adjourned.

Catalogues and Lists.—AUTOMATIC AND ELECTRIC FURNACES, LTD., 281-283, Gray's Inn Road, W.C. 1.—Advance copy of a new catalogue (15 pp.) of "Wild-Barfield" electric furnaces. Owing to the advance in mass production methods, larger sizes have been developed, and furnaces for the hardening of long articles, such as cam-shafts, tools, &c., are being manufactured.

THE BRITISH-THOMSON-HOUSTON CO., LTD., Rugby.—Descriptive List No. 4154 B (32 p.p.), dealing with ironclad oil-break switchgear of many types. Profusely illustrated throughout, and giving ordering instructions.

MESSRS. WERTHEIMER & WHITE, 64, Victoria Street, S.W.1.—Leaflet describing Dawson hardened copper and its various uses.

THE B.E. CO. (OF LONDON AND BIRMINGHAM), LTD., Hendon House, 57, Upper Thames Street, E.C. 4.—Illustrated leaflet giving descriptions and prices of "Hendon" British-made drawn wire lamps.

MESSRS. WATSON & SONS (ELECTRO-MEDICAL), LTD., Sunic House, Parker Street, Kingsway, W.C. 2.—Bulletin 25 S. An illustrated and priced pamphlet (16 pp.) dealing with "Sunic" X-rays tube stands and radiographic couch.

THE ILFORD DRY BATTERY CO., LTD., 83, Wool Exchange, Coleman Street, E.C. 2.—Illustrated leaflet dealing with the "Inert" combined battery and case.

THE GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, E.C. 4.—A well-illustrated catalogue (X section, 13th edition, 36 pp.) dealing with switchboards and switchgear, sealing boxes, &c. Fully priced.

The Anti-Dumping Bill.—The Prime Minister cannot at present name a date for the re-introduction of the Anti-Dumping Bill.

Holidays.—MESSRS. A. REYROLLE & CO., LTD., of Hebburn-on-Tyne, notify that their works will be closed from Saturday, June 19th, until Monday morning, June 28th, it being Race Week.

LIGHTING AND POWER NOTES.

Accrington.—YEAR'S WORKING.—A loss of £989 was incurred by the electricity undertaking during the year ended March 31st last. Although the units sold fell from 6,948,390 to 6,705,274, the revenue increased from £45,223 to £57,450.

Athy (Co. Kildare).—ELECTRIC LIGHTING SCHEME.—The estimated cost of the proposed electric lighting scheme for the town is stated at £13,000.

Australia.—TASMANIA.—HYDRO-ELECTRIC SCHEME.—Giving evidence at Queenstown before the Public Works Committee on the matter of the construction of a road to link up Hobart and the West Coast, Mr. Huntly Clark, engineer of the Mount Lyell Co., said that the proposed King River hydro-electric power scheme would be capable of yielding 70,000 H.P. He had the data of four schemes within 10 miles of Queenstown, with a total of 110,000 H.P. The proposed road from Gormanston to Lake St. Clair would be invaluable for the distribution of power to other parts of the State.

MELBOURNE STRIKE.—Owing to a strike of employés at the power stations, the public services have been suspended. It is feared that the strike will become general.

MUNICIPAL UNDERTAKINGS IN N.S.W.—The report of the Local Government Department of the New South Wales Legislature for the year ended June, 1919, shows that 7 out of 14 electricity trading undertakings sold electricity at less than its cost price, the loss ranging from 5·33d. per unit to ·21d. per unit. The largest loss per unit of electricity was incurred by the undertaking at Tenterfield, but as trading operations did not commence until 1917, the result for the year under review cannot be considered as indicating the result which will be obtained when the undertaking has become thoroughly established. Five undertakings show profits varying from 1·29d. per unit in the case of Broken Hill to ·44d. per unit at Goulburn. The particulars of the units of electricity sold by the undertakings at Moss Vale and Penrith were not furnished to the Department. There was, however, a loss in trading at Moss Vale, and a profit at Penrith. All but three of the electricity trading undertakings show a net return on the capital invested. The highest return, viz., 13·21 per cent. on the capital invested, is shown by the undertaking at Broken Hill. The undertaking at Goulburn

Digitized by Google

shows a return of 8·46 per cent., that at Tamworth 8·16 per cent., and that at Newcastle 7·69 per cent. on the capital invested. The most striking result is shown by the Newcastle undertaking. It has been converted from an unprofitable to a very profitable concern during recent years. Moreover, this result has been achieved by trading operations only. The ratepayers have not been asked to assist the undertaking by levies in the form of loan rates.

Ballycastle (Co. Antrim).—Public Lighting.—At the last monthly meeting of the Urban Council a communication was read offering the local gasworks for sale. The chairman said that, so far from buying over the gasworks, the town should be lighted by electricity, and several members concurred that when the Council had waited so long it should wait till it could have electric light.

Bangor.—Year's Working.—In his annual report for the year ended March 31st last, the electrical engineer announces a gross profit of £1,058. The Corporation is urged to reopen negotiations with the North Wales Power Co. for a bulk supply, in order to obviate the increases in price which will be necessary if the present plant remains the sole source of supply.

Barrow.—Electricity Supply.—In Committee, the Council decided to defer a recommendation from the Electricity Committee to approve of a resolution "that an adequate supply of electricity is necessary for the industrial development and well-being of this district. In order that this supply may be provided, and the sources of power available in the district may be utilised to the greatest advantage, this Council considers that a Joint Electricity Authority should, with the least possible delay, be constituted for the Furness and South Cumberland District, under the Electricity Supply Act, 1919, and undertakes to co-operate in the formation of such authority. The Council, therefore, requests the Electricity Commissioners to take the necessary steps for determining the area of the district, and for the establishment of a Joint Electricity Authority."

Bootle.—Proposed Extensions.—It was stated at a recent Council meeting that Liverpool was unable to meet the obligation to provide a bulk supply at a moment's notice under the linking up agreement, and it was, therefore, decided to apply for permission to augment the generating plant. Sanction is being sought to a loan of £40,000.

Brighton.—Extension of Area.—The supply area of the Brighton undertaking will, no doubt, be greatly extended in the near future. Hove has already accepted the terms for a bulk supply, and Portslade, Southwick, Shoreham, Newhaven, and Rottingdean, are also considering taking supplies from Brighton.

Burton-on-Trent.—Power Supply.—The Town Council has applied to the Board of Trade for permission to supply electricity to several South Derbyshire manufacturers whose works are outside the area of supply.

Bury St. Edmunds.—Extensions.—In adopting the Electricity Committee's report, the Council decided to apply for sanction to borrow £12,200 to carry out necessary extensions, and to cover expenditure already made in this connection.

Continental.—France.—The Brussels company, which is the concession-holder for the supply of electricity in many localities of the Département du Nord, has applied to the French Government for an increase of the rebate allowed on English coal from 150 to 250 fr. per ton; also for an increase in the tariff charges for gas and electricity allowed in the localities served. The high cost of imported coals causes a loss on the undertaking. Another aspect of the coal question has arisen in connection with the Government's restrictions of the periods of electric lighting. The Mayor of Toulon had applied to the Minister of the Interior for exemption from the restrictions on the ground that the electricity supplied to the city was water-generated. The argument was cogent, and seemed unanswerable; but the Minister replied that the surplus in Toulon resulting from the restrictions would be available in neighbouring localities, and, moreover, no exception could be made in the case of any city, like Toulon, more favourably situated than others.

Spain.—The report of the Sociedad Hidroelectrica Espanola, at the general meeting in March, was mainly concerned with the progress made with the new station at the Dos Aguas Falls, on the Jucar River. This, if no unforeseen hindrances occur, is expected to be completed by the middle of next year, in anticipation of which contracts have been placed for all the hydraulic and electrical plant needed for its working. The output of all the company's undertakings in the past year totalled 130,175,158 kw.-hours, or 14,129,420 more than in the foregoing year. The price of coal, which continued abnormally high, had caused heavy losses in the thermic stations, having amounted to 2,075,000 pesetas, or about 1,300,000 more than in normal years. In hopes of the early inauguration of the Dos Aguas Falls station, demands for power had come in from the whole region of the Levant, the most important industries being represented, and, if success crowned their efforts, as was confidently expected, all the places which constituted their market would be amply served. The profit and loss account showed a profit, including the balance from previous years, of 3,708,804 pesetas, which is distributed as follows:—5 per cent. to reserve, 185,440 pesetas; Council's fees, 7½ per cent., 278,160 pesetas; dividend of 5 per cent. on Coupon No. 11, 1,000,000 pesetas; ditto on Coupon No. 12, 1,000,000 pesetas; dividend tax, 65,740 pesetas; company's Benevolent Fund, 20,000 pesetas, and balance carried forward, 1,159,464 pesetas. This result confirmed the anticipations of the report for 1919, and constituted an assurance for the future. The Electra de Lima (Portugal)—an offshoot of the company—had increased its capital from 4,000,000 to 10,000,000 pesetas, which had been distributed among holders of shares in circulation. With the help of most important industrial concerns, the Hidroelectrica had contributed to the creation of the Sociedad de Electrificacion Industrial, with a capital of 5,000,000 pesetas. The objects of this company were the electric conversion of transport, the study and development of large waterfals, and the manufacture of electrical machinery. Other companies in which the Hidroelectrica has interests are the Union Electrica de Cartagena and the Co-oporativa Electra de Madrid.

Concessions have recently been granted for the establishment of plants to utilise the water power of the Tajo by the Sociedad Hidroelectrica Lobinillas, and of the rivers Bairola, Chisaguer and Cinca, in the Province of Huesa, by the Sociedad Hidroelectrica, Iberica.

Darwen.—Bulk Supply.—The Corporation has decided to arrange for an additional supply of electricity from Blackburn. High-tension mains are to be laid underground from the borough boundary to the electricity works, at an estimated cost of £27,000. It is anticipated that the supply will be available for the coming winter.

Dorchester.—Proposed Municipal Purchase.—The Town Council has decided, in response to a letter from the Electric Light Co., to re-open negotiations for the purchase of the local electricity undertaking. An offer of £8,500 had been made, but this was refused by the company.

Houghton-le-Spring.—House Lighting.—The Urban District Council has decided to approach the Electric Light Co. as to a supply of electricity to the houses being erected by the Council.

India.—Mysore Electrical Scheme.—There are several schemes before the Government for the purpose of still further developing the Cauvery Falls. The immediate needs of the State of Mysore, the cities of Mysore and Bangalore, the Gold Fields of Kolar, &c., are met by the existing 25,000 h.p., but in the near future more power will be needed, and to that end the Government has sanctioned a sixth installation at Sivasamudram. Much of the old plant, which has done good service, is to be scrapped. The new installation will supply the Kolar Gold Fields and Bangalore. In addition to this, the other schemes before the Government include the harnessing of the Shimsha Falls and the Mekadatu Falls. The potentialities of the Shimsha Falls are said to be great. The late Captain Dawes, who lost his life in the survey of the Cauvery, expected to get by pipe line a clear fall of 720 ft., taking the supply 40 miles up river. The scheme would probably cost about 70 lakhs of rupees. The scheme at Mekadatu is much smaller, and would cost about 39 lakhs of rupees. The electrical engineer has given his opinion to the effect that the Falls should be utilised as speedily as possible. It is estimated that when all the schemes have materialised the combined power will represent 100,000 h.p. at the very least. The price of coal in India is now prohibitive, so that a cheap power supply is absolutely necessary.

Kettering.—Loans Sanctioned.—The Electricity Commissioners have sanctioned loans for £9,284 for plant at the Urban District Council's electricity works.

Lincoln.—Year's Working.—The report on the electricity undertaking for the year ended March 31st last, records an increase in revenue of £25,332 and an additional expenditure of £22,202. The net profit for the year was £3,141, which, with the balance brought forward, totals £5,124. £5,000 is to be placed in the depreciation fund.

Extensions.—The ultimate cost of the St. Swithin's extension scheme, which was originally estimated at £250,000, is now stated to be £400,000.

Liverpool.—New Switchgear.—Switchgear in connection with the new generating plant at Lister Drive power station is to be purchased by the Liverpool Corporation at a cost of £6,693.

London.—St. Marylebone.—The Borough Council is applying to the Electricity Commissioners for permission to give a bulk supply to the Hampstead Borough Council, and for sanction to the expenditure of £9,500 for the provision of the necessary cables.

Electricity Consumption.—The London County Council has prepared a return relating to the supply of electricity in and around the County of London. The total number of units sold during the year 1917-18 was, after allowing for intersales, 449,686,063 by the London undertakings, and 167,204,097 by the extra-London undertakings. These figures show increases in the period of four years since 1913-14 of 130,715,453 units, or 41 per cent., and 39,858,827 units, or 31·3 per cent. respectively. The analysis of the 449,686,063 units sold by the London undertakings gives the following results:—Public street lighting, 9,018,088; other lighting, 115,105,312; power, heat, and traction, 318,903,616; and bulk, 6,659,047. It will be seen that power and heat supplies account for 71 per cent. of the total units sold, and that such supplies were nearly three times as great as those for private lighting.

Non-Union Labour.—As announced in our "Correspondence" columns, the Trade Unions represented on the Joint Industrial Council for Electricity Supply, No. 10 (Greater London) Area, have decided to cease work on July 1st if any non-Union labour is employed in any supply undertaking in the district, and from that date will refuse to connect up work done by non-Union labour.

Digitized by Google

Malton (Yorks.).—PUBLIC LIGHTING.—The Urban District Council has accepted the tender of the Northern Counties Electric Supply Co., for lighting by 121 50 C.P. lamps for three years, at £580 12s. 6d. per annum.

Manchester.—SALE OF UNDERTAKING.—The Corporation has accepted an offer from the Stockport Corporation for the purchase of the Heaton Norris undertaking. It has also arranged to give a bulk supply to Stockport for a period of 10 years.

BULK SUPPLY.—An application from the Lancashire Power Supply Co. for a supply of electricity from the new power station at Barton, when completed, is under the consideration of the Electricity Committee.

Market Drayton.—PUBLIC LIGHTING.—The Urban District Council has asked the Electric Light Co. to submit an estimate for public lighting, and the conversion of the gas lamps.

Navan (Co. Meath).—LIGHTING SCHEME.—At a special meeting of the Council, on Thursday last, Mr. J. J. Woods, consulting engineer, was in attendance, and submitted three alternative schemes for the lighting of the town. The first was estimated at £12,090, and the generating and distributing costs at 10¼d. per unit, suction gas engines to be the prime movers. The second scheme included the purchase of the local gas company's premises, and generating with town gas. The estimated cost, exclusive of the purchase of the gas works, was £10,215, and the generating and distributing costs, 11·4d. The third scheme was the offer of a local saw mill owner to supply power, the Council installing all the necessary electric plant. The estimated cost was £7,835, and the distributing cost 6·15d. After the various schemes had been explained in detail, the last was adopted, subject to the Council's ability to obtain a satisfactory lease of the land for generator, battery and switchboard-rooms.

Newhaven.—ELECTRICITY SUPPLY.—It is stated that the cost of providing the necessary plant for supplying Seaford and Newhaven from the Eastbourne station would be £25,000, and the Electricity Commissioners consider that it will be more advantageous to supply the towns from Brighton.

Nottingham.—ELECTRICITY SUPPLY.—The Corporation received a letter from the Derbyshire and Notts. Electric Power Co., stating that the company was about to erect a new station on the Trent in accordance with a programme arranged prior to the war, but temporarily suspended. The company intimated its preparedness to enter into an arrangement to supply the Corporation, but the chairman of the Electricity Committee urged the Corporation to reserve the right to supply electricity in the Nottingham area to itself. A motion to postpone consideration of the Electricity Committee's report upon extensions was negatived, and the proposed scheme will be proceeded with.

Portrush.—EXCLUSION FROM AREA.—At a meeting of the Urban District Council a petition was submitted from residents of Dhu Varren protesting against the exclusion of that area from the proposed electrical supply scheme. It was explained, however, at the meeting that if the loan of £15,000 was sufficient, both the old and new areas would be embraced in the scheme, but, if not, Dhu Varren would be provided for in a separate scheme.

Rochdale.—YEAR'S WORKING, &C.—The electricity output for the year ended March 31st, amounted to 15,295,789 units, an increase of 5·4 per cent. on the previous year. The increase in consumers, particularly for lighting has been the greatest recorded, and the result for the year's working shows a surplus of £14,320 18s. 11d., of which the Committee recommends that £5,000 be placed to the relief of the rates, and the remainder allotted to the reserve fund, which now stands at £12,871. The Committee has decided to negotiate for a further bulk supply from the Lancashire Electric Power Co. of 8,000 KW., and to lay new E.H.T. mains to the districts of Firgrove, Balderstone, and Spotland. The application made for sanction to the borrowing of £68,500 has been granted without the necessity of a local inquiry.

Sheffield.—NEW POLICY.—When the question of increased charges was introduced at the recent Council meeting, Mr. J. G. Graves moved the rejection of the report, and put forward a proposal to charge for lighting and power on the same basis. From the subsequent discussion, in the course of which Mr. Graves's proposal was designated as sentimental and unbusinesslike, it would appear that his object was to reduce lighting charges to the same level as power charges, which, it was stated, would cause an annual loss of £51,211. Mr. Graves's contention was that as the same machinery and cables were used for both purposes, the cost to each class of consumer should be the same. The amendment was carried by a vote of 24 to 21.

South Africa.—EXTENSIONS AT PRETORIA.—The Pretoria Town Council has received authorisation from the Government for capital expenditure amounting to £261,000. The bulk of the money will provide for additional electric power stations, consisting of a new generating station at Mitchell Street, equipped with 6,000 KW. of plant, and a 3,000-KW. sub-station at Schoeman Street. The estimated cost is £200,000, inclusive of £15,000 for the construction of a dam on the western town lands to provide water for a new power station, Pretoria iron mines, and other industrial undertakings. To provide for a "make-up" of at least 500,000 gallons per day, an additional expenditure of £25,000 will be necessary on the dam. These proposals are part and parcel of the development of Pretoria West as an industrial centre. —*Board of Trade Journal.*

ELECTRIC LIGHTING SCHEME.—The Standerton Town Council has approved a scheme prepared by Mr. Hodge, the town engineer, which provides for a steam engine and generator for three-phase current at 3,300 volts, 50 cycles, with high-tension cables laid to distributing centres, transformed down to 415 volts for power, and 230 volts for lighting, and for the pumping station a 3,300-volt overhead transmission line. Following are the figures of estimated cost:—Buildings, £2,000; 130-KW. plant, £8,450; water service, £100; distribution, £1,500; transmission line to pumping station, £1,950; electrification of pumping station, £1,650; for contingencies and possible advance in prices, £1,350; total, £17,000.—*Engineering in South Africa.*

Stoke-on-Trent.—ELECTRICITY SUPPLY.—It was stated at a recent Council meeting that consumers in the Fenton district had complained of an inadequate supply of electricity, although a bulk supply was being transmitted to Newcastle. The chairman of the Electricity Committee pointed out that the Electricity Commissioners had ordered this bulk supply as a part of a general scheme, and the Council was bound by a 10 years' agreement.

Stratford-on-Avon.—PURCHASE ABANDONED.—The Town Council has decided to discontinue the negotiations for the purchase of the undertaking of the electricity company. The Council has agreed to the company increasing the charge for electricity up to 1s. per unit.

Sudbury.—ELECTRICITY SUPPLY.—Unanimous approval has been given by the Council to a scheme for the supply of electricity to the town, proposed by the East Anglian Electricity, Ltd. The company intends to erect a 600-H.P. station, and to utilise the old post office as a showroom. Distribution will be effected by low-voltage overhead lines, and it is hoped to be able to supply at cheap rates.

Sunderland.—EXTENSIONS.—The Corporation electricity department has engaged the British Engine, Boiler, and Electrical Insurance Co. to supervise the construction of the new boiler house plant and installation at Sunderland; 3,208 square yards of land have been bought in Farrington Row, at a cost of 10s. per square yard, for the purpose of the extensions.

Trowbridge.—PUBLIC LIGHTING.—The Urban District Council has invited the E.S. Co. to submit a price for public lighting in competition with the gas company.

Walsall.—EXTENSIONS.—The Corporation Electric Supply Committee proposes that, with a view to meeting demands for electricity, extensions of mains and feeders be carried out to supply current to certain premises, at a cost of £1,470; and, further, that application be made to the Electricity Commission for sanction to borrow £15,000 for the purposes of the undertaking, including £12,000 for extensions of mains.

Wimbledon.—LOANS SANCTIONED.—The Town Council has received consent to a loan of £15,000 for mains and services, and £2,100 for transformer sub-stations, and also permission to install two boilers, &c.

Wolverhampton.—NEW PLANT.—The electrical engineer has been authorised to negotiate and arrange for the supply of an additional 500 KW. of converter plant, at a cost not exceeding £3,000, plus 10 per cent. for contingencies.

TRAMWAY AND RAILWAY NOTES.

Accrington.—YEAR'S WORKING.—There was a loss of £295 on the tramway undertaking for the past year. Revenue increased to £50,153 from £41,633, and the working expenses also increased in proportion. The total amount taken from the rates since the system was inaugurated, and not yet repaid, is £4,568.

RENEWAL OF TRACK.—It was stated at a meeting of the Town Council that in three years' time it would be necessary to relay the tramway track at an estimated cost of £60,000 to £70,000. The fares are to be increased 50 per cent.

Bolton.—PROBABLE EXTENSION.—The Tramways Committee here, faced with possible motor-omnibus opposition from Wigan, is considering extending the tramway system to the industrial township of Westhampton.

Bradford.—TRAMWAY LOSSES.—At last week's full City Council meeting it was stated that the tramway undertaking was losing money at the rate of £30,000 a year. It was decided to call a special Committee meeting to deal with the matter, and recommend to the Council what steps should be taken to increase the revenue. It is considered extremely likely that some adjustment of stages will be made whereby 1d. stages, but for shorter distances, can again be introduced.

INSPECTORS' WAGES.—At a recent City Council meeting the weekly wages of tramway inspectors were raised to £5, instead of £4 1fs., as had been previously recommended.

Digitized by Google

Burton-on-Trent.—FARE INCREASE.—The proposal of the Public Works and Tramways Committees to increase the fares and make 2d. the new minimum, with the exception of workmen's and children's tickets, has been approved by the Town Council. An amendment in favour of overlapping 1d. stages was defeated.

Continental.—SPAIN.—The Commercial Secretary to H.M. Embassy, Madrid, states that application has been made by the "Banco Espanol de Credito" for authorisation to install a Metropolitan Railway at Bilbao, the estimated cost of which is 13 million pesetas.

The scheme consists of two lines. The first starts from the Square de los Santos Juanes, and passes through a tunnel and in a straight line to the Institute, with an underground station which will link up the Lezama Railway. The line continues to the railway station of Las Arenas, and here another underground station is to be constructed, which will be called Arenal, between the Church of San Nicolas and the Bank of Bilbao; from here, in a straight line, and passing under the River Nervion, the line goes on to the Plaza Circular, where there will be another station, with lifts; it then continues along the Gran Via, with a station at Diputacion, Plaza Eliptica, Park, and San Mamos, and twists to the left, following the Alameda, with two stations, called Alameda and Basurto, and going on to La Casilla, where the first line terminates.

The second concession starts from the Casilla Station, the terminus of the first line, and goes on through the Calle de la Autonomia, with stations at Echaniz, Amezola, and Plaza de Zalalburu; it then passes through the San Francisco quarter, with stations called San Francisco, Miravilla, and Bilbao la Vieja, and, crossing the river over the San Anton Bridge, joins the first line at the station at Achuri.

The lengths of these two lines are respectively 3,158 and 1,949 metres, and the estimated cost respectively is 8,205,679 and 4,554,192 pesetas.

A double line will be constructed of 1-metre gauge, as it has been considered preferable to adopt this kind of line, which allows of the joining up of the Metropolitano with all the narrow-gauge stations of Bilbao, which will then be able to carry goods trains during the night, when the passenger traffic has ceased.

In consequence of the large number of stations projected, situated at distances between 200 and 300 m. apart, all the principal centres of the town will be served, reducing the congestion in the streets, and increasing the rapidity and economy of communication between the different quarters.

Dublin.—WAGE INCREASE.—Negotiations between the Dublin United (Electric) Tramway Co. and their employés have resulted in an increase of 8s. per week for every worker over 18 years of age, youths under 18 to receive 4s. per week, vanmen and parcel checkers 6s., women 4s., and boys 2s. Before this latest arrangement motormen were paid £3 10s. 5d. for a six-day week, and conductors £3 8s. 1d., with extra pay for Sunday work.

Huddersfield.—FARE INCREASE.—The car fares were increased on June 12th. No alteration has been made in the 1½d. and 2d. fares, but the longer distance fares have been advanced by approximately 50 per cent. Children's fares have now a 1d. minimum, as against ½d., with half-fares for other rates. The recent wages award of 10s. per week will cost the Committee £16,000 a year.

In consequence of numerous public requests for more, and later, Sunday evening car facilities, the tramway manager has requested the tramwaymen to work an hour longer on Sunday evenings. A ballot is being taken by the men on the question.

Leeds.—FARE INCREASE.—The increased tramway fares decided upon by the City Council took effect on June 10th. The receipts on that day were £2,451, from 359,381 passengers carried. On the previous Thursday the figures were £2,129 from 363,804 passengers. The returns at present are fluctuating and unreliable as a basis upon which to judge the effect of the increase.

London.—UNDERGROUND FARES.—A Select Committee of the House of Commons has passed the London Electric Railway Companies (Fares) Bill, thereby giving assent to the temporary raising of the maximum scale of fares and charges proposed by the promoters. Clauses were adjusted, and the effect of the Bill, as it now stands, is to give the companies a temporary power to charge a maximum fare at the rate of 1½d. a mile third-class and 3d. a mile first-class. They have also obtained the power to charge a minimum initial fare of 2d. third-class and 4d. first-class, however short a distance the passenger may travel. Workmen's return tickets may be issued at the price of a single ordinary fare.—*Morning Post.*

SHORT STRIKE.—On June 10th the wiremen at the Brimsdown power station ceased work owing to delay in paying increased rates. The matter was settled in a few hours, and a stoppage of the Metropolitan Electric Tramways thereby averted.

New Zealand.—CHRISTCHURCH.—The revenue account of the Christchurch Tramway Board for the year ended March 31st shows a deficiency of £1,237, as against a surplus of £2,741 for the previous year. The earnings were £205,976, operating expenses £145,960, and standing charges £61,253. The position was regarded as satisfactory considering the increases in wages and cost of material and the trouble incurred during the year. The deficiency is the first since the inception of the tramways.—*Auckland Weekly News.*

North-Eastern Railway.—EXPERIMENT.—In order to determine whether it was practicable to employ a third-rail system with a shoe fitting underneath the flange of the rail, the N.E. Railway Co. has been conducting experiments on a specially constructed part of the track between York and Scarborough. The chief point of investigation was the engaging of the shoe with the rail after the passing of a "railless" portion of the track, as it is intended to use this method in conjunction with an overhead trolley system, the latter to be employed in negotiating long crossings, shunting yards, and stations. It is understood that the system proved quite satisfactory in this respect even when high speeds were employed. This is the first trial of the system in this country, although it is being satisfactorily employed on the Central Argentine Railway. The latter system was described in the ELECTRICAL REVIEW of November 1st, 1918 (p. 411).

Nottingham.—YEAR'S WORKING.—The total revenue for the past year's working was £378,948, and the expenditure totalled £294,224. The balance of £84,724 (which fell from £103,988 for the previous year) was distributed as follows:—£24,000 to rate relief, £21,286 to redemption of capital, £18,270 to reserve and renewals funds, £16,168 to interest on loans, and £2,000 to the accidents reserve fund. The total number of passengers carried increased by about 6 millions to 58,749,654, and the total mileage from 3,572,973 to 4,088,570. The total contributed to rate relief by the undertaking since 1902 amounts to £350,000.

South Africa.—JOHANNESBURG.—The tramway strike was settled on May 20th; the men gave way on all points, but the Council promised that an inquiry should be held into the working of the Advisory Committee. The feeling of the community was very strongly indicated against the strikers, and the Citizens' Protection League was able to maintain a voluntary system of motor transport for women workers and aged people. The strikers did not have the support of the other Unions.

EAST LONDON.—The strike of tramway employés is not settled, and the cars are still idle. The latest development is that the Council has given notice to the strikers to send in their uniforms, and has invited applications from men to run the service. These applications have been sufficiently numerous to enable the Council to decide to re-start the service with a fresh staff.

Thornaby.—POWER SUPPLY.—It was reported to the Town Council that in connection with the Teesside tramway arbitration the Joint Committee for Stockton and Thornaby had agreed that the power for this part of the system should be purchased from the Stockton Corporation Electricity Department, the latter undertaking not to make any "undue profit." The Corporation feels, however, that this is not sufficiently explicit, and Stockton has been asked to agree to a definite maximum rate of profit based upon the bank rate.

Tramway Dispute Settled.—The latest claim for higher wages by tramway employés has been settled. A flat rate increase of 9s. will be applied to the London area, and District Industrial Councils are to make awards of from 7s. to 9s. increase in their areas.

West Hartlepool.—YEAR'S WORKING.—There was a gross profit of £6,625 on the working of the tramways during the past year, and a surplus of £863 was carried to reserve.

Wolverhampton.—YEAR'S WORKING.—The gross profit on the tramways for the past year was £21,828, making with profits from the motor-char-à-bancs undertaking a total of £22,204. This has been distributed as follows:—Interest on capital, £4,660; income-tax, £4,214; repayment of loans, £6,564; additions and improvements, £928; and to reserve and renewals fund, £5,838. It is anticipated that £11,000 will be spent on reconstruction during the current period.

CHANGE OF SYSTEM.—The Tramways Committee recently reported to the Corporation upon the question of changing over from the present (Lorain surface-contact) system to overhead trolley working. The proposal was most opportune, as the existing track requires thorough renewal and a double track was already under consideration. The present single track is totally inadequate to meet requirements, and many arguments in favour of the introduction of the double-track overhead system were put forward. The cost of the scheme is estimated at £396,000, made up of the following items:—Overhead equipment, £50,000; 20 miles of track, £320,000; street alterations, £12,000; and special work, £14,000. The sale of old materials is expected to realise £21,000, leaving the estimated net cost at £375,000. The Council has decided to proceed with the change-over by easy stages; the first amount to be spent will be £50,000.

TELEGRAPH AND TELEPHONE NOTES.

Argentina.—WIRELESS CO.—The Compania Transatlantica Radio Telegraphica is reported to have been formed at Buenos Ayres to work the wireless concession granted to the Siemens and Schuckert group on March 15th, 1919. The ordinary shares for 4,500,000 Argentine dollars are intended to pay for the machinery and apparatus awaiting shipment in Germany, whilst the proceeds of the 3,000,000 dollars in preference shares are to defray the cost of erection of the installation and other works

Digitized by Google

Direction-Finding Stations.—The following are the wireless direction-finding stations operated by the Royal Navy, under the conditions laid down for the use of these stations by the Mercantile Marine:—Amlwch, Berwick, Carnsore, Flamborough, Larne, Lizard, Peterhead, Rhyl, and Seaview (Malin Head). Rhyl is not fitted with transmitting apparatus, and is controlled by Amlwch. Seaview also has no transmitting apparatus, and is controlled by Malin Head, which keeps watch on 600 metres.—*Manchester Guardian.*

France.—WIRELESS TELEGRAPHS.—It is announced that the French wireless system is to be reorganised, special attention being paid to Colonial communication. Stations are to be erected, or existing stations are to be improved, at Jibuti, Dakar, Martinique, French Guiana, Tahiti, &c. It is also proposed to erect stations at Bordeaux and Lyons for commercial communication with the U.S.A.

India.—NEW CABLE.—It is understood that the fourth cable line which was to be laid between Bombay and Aden is now in working order; according to a mail dispatch it had developed some faults. The cable was laid by the Eastern Telegraph Co.

London.—TELEPHONE SERVICE.—In an article contributed to the *Telegraph and Telephone Journal*, Captain J. G. Hine states that 160 miles of new pole route were constructed in London during the past 12 months, bringing the total mileage of pole route to 2,780, and the open wire mileage to over 60,000. (A considerable amount of the open wire acquired from the National Telephone Co. has been replaced by underground wire.) Fifty miles of single pipe were laid, bringing the total to 3,625. Over 45,000 miles of underground wires were laid, bringing the total to over one million miles. Over 20,000 new lines were brought into use, and over 30,000 telephone stations connected with these lines.

AUTOMATIC TELEPHONES.—Mr. Illingworth (P.M.G.), in the House of Commons, said: The provision of a system of automatic telephone exchanges for so large an area as London presents peculiar difficulties. It is proposed to install one automatic exchange as soon as possible, and I hope the experience thus obtained may make it possible to frame a complete scheme. The existing exchanges would be replaced gradually, and it would be some years before an automatic system for the whole of London could be completed.—*Daily Telegraph.*

Strike of Wireless Operators.—The failure of the Marconi Co. to deal with a wages claim made on behalf of operators by the Association of Wireless Telegraphists led to a general strike, which commenced at 11.30 a.m. on June 15th. The Association states that the claim was made last September; but the Marconi Co., in a notice issued in reply, says that the request was not actually received until May 17th, and confirmed in writing five days later, and the matter has been placed in the hands of the Association of Engineering Employers. The claim is for a scale of pay rising from 48s. per week for the first year to 120s. in the ninth year, an eight-hour day, and the continuance of "war-risk bonus" as long as it applies to other seafarers. Upwards of 4,000 operators are affected, some of them being employed by Siemens Bros. and the Radio Communication Co.

Telephone Improvements.—Replying to a deputation which waited upon him at the General Post Office, on the defects of the telephone service, especially in districts swept by strong winds and severe storms, the Postmaster-General said the department was already engaged in a large extension of underground telephone lines in various parts of Lancashire and Yorkshire, which it was hoped would go far to obviate the trouble. Increased facilities were also being provided by the laying of new wires between Oldham, Manchester, Huddersfield, Liverpool, and other centres.—*Daily Telegraph.*

CONTRACTS OPEN AND CLOSED.

(The date given in parentheses at the end of the paragraph indicates the issue of the ELECTRICAL REVIEW in which the "Official Notice" appeared.)

OPEN.

Australia.—SYDNEY.—August 4th. N.S.W. Government Railways and Tramways. Two 1,000-KW. sub-station units. Chief Electrical Engineer, 61, Hunter Street, Sydney.

August 3rd. Department of Public Works. Turbines and generators for the Barren Jack hydro-electric development scheme. Department of Public Works, Sydney.

N.S.W.—Postmaster-General's Department. August 2nd and 5th. Aluminium sheet, brass rod, &c., scheduled 769; platinum wire, gold and silver wire, scheduled 768. (June 11th.)

WESTERN AUSTRALIA.—Postmaster-General's Department. August 3rd. 326 accumulators, schedule 668. (June 11th.)

Belgium.—June 22nd. Municipal authorities of Wevelghem. Tenders for two sub-transformer stations for converting three-phase, A.C. Particulars can be obtained from M. Goffin, 113, Avenue Albert, Brussels, and tenders are to be sent to La Salle Communale, Wevelghem.

June 26th. Municipal authorities of Voroux-Goreux (Province of Liége). Tenders for the concession for the electric lighting of the town.

Bedford.—June 21st. Electricity Department. One 2-ton locomotive jib crane, with grab and track rails, steam and other pipework. (June 4th.)

Canterbury.—June 22nd. Electricity Department. 1,210 yards '25 sq. in. × '25 sq. in. × '125 sq. in. L.T. triple-concentric paper-insulated cable. (June 11th.)

Carlisle.—June 25th. Electricity Department. One 3,000-KW. turbo-alternator and condensing plant. (May 28th.)

Colne.—Electricity Department. Steam and water piping. (June 11th.)

Dartford.—June 26th. Electricity undertaking. Rotary converter, transformers, switchgear, &c., L.T. twin cable-feeder, pillar and feeder-panel. (June 11th.)

Dundee.—June 24th. Electricity Department. Steam feed and water piping, two turbine-driven feed pumps. (June 11th.)

Edinburgh.—June 19th. Electricity Supply Department. E.H.T. and L.T. switchgear, &c., for Portobello station. (May 21st.)

Glasgow.—July 6th. Tramways Department. One 10,000-KW. steam turbo-alternator, with condensing plant. (See this issue.)

Liverpool.—June 21st. Board of Guardians. Electrical supplies (three months) for the township of Toxteth Park. R. Albert James, Clerk to Guardians, 15, High Park Street.

Manchester.—June 25th. Electricity Committee. Twelve months' supply electricity meters, time switches, potential and current transformers, motor-starting switches, C.C. and A.C. motors. (June 11th.)

New Zealand.—AUCKLAND.—September 1st. Harbour Board. For the supply of electric capstans and spares. Messrs. W. & A. McArthur, Ltd., 18-19, Silk Street, Cripplegate, London.

Newport.—June 26th. Electricity Department. Turbo-alternating plant, surface-condensing plant, boilers, economisers, draught plant, steel flue and stack, &c. (June 4th.)

Nuneaton.—June 30th. Electricity Department. 1,000-KW., D.C., geared turbo alternator, surface-condensing plant and pipework. (June 4th.)

Salford.—June 21st. Electricity Committee. H.P. steel steam pipes and separator, and steel exhaust steam pipes and supports. Borough Electrical Engineer, Electricity Works.

Southampton.—July 3rd. Electricity Department. E.H.T. and H.T. switchgear and D.C. control panel. (June 4th.)

Swindon.—June 26th. Electricity Department. 2,000 yards 3-in. four-way stoneware conduits, light steel poles for overhead lines. (June 11th.)

Warrington.—June 29th. Electricity Department. Truck type ash elevator and hopper. (June 11th.)

July 13th. Electricity and Tramways Committee. Two 6,000-KW. turbo-alternators. (See this issue.)

CLOSED.

Bedford.—The Education Committee has appointed H. Bacchus, Ltd., as electricians for six months.

Clacton-on-Sea.—Urban District Council:—

English Electric Co.—Diesel engine, £7,040: generator, £1,714.

Doncaster.—Mr. R. B. Isle has secured the contract for the electric light installation at St. Andrew's Church.

Dundee.—The Tramways Committee has placed an order with an American firm for 1,000 tons of rails, at £24 6s. per ton, thereby hoping to save £4,000. The City Engineer was unable to obtain a lower estimate than £28 7s. 5d. per ton, including carriage, from a Middlesbrough firm.

India.—Messrs. Boving & Co. have received an order from the Mysore Government for four 5,600-H.P. turbines for the Cauvery River Scheme. Further reference to this contract appears in our "Business Notices" to-day.

London.—SHOREDITCH.—Electricity Committee.

5,000-KW. turbo-alternator, with condensing plant:—	Price.	Efficiency at full load-lb. of steam per KW.-hour.	Delivery.
Met.-Vickers Elecl. Co., Ltd. (recom.)	**£39,995**	**13·13**	**56 weeks.**
C. A. Parsons & Co.	43,000	13·6	64 "
British Thomson-Houston Co., Ltd. ..	39,980	13·7	52 "

Digitized by Google

The remaining offers, owing to low efficiency or high price, were not considered. 13 tenders were received, 10 from British firms, two from Swiss firms and one from Sweden.

BOILER PLANT.

	Price.	Efficiency.	Delivery.
Clarke, Chapman & Co.	£18,196	80/81%	—
" "	18,105	—	—
" "	17,740	—	—
Baldwin Loco. Co. of America	18,500 about	not stated	about 8 mths.
Babcock & Wilcox, Ltd.	16,620	82%	11 months.
" " (land type)	15,960	80%	11 months.
Stirling Boiler Co., Ltd.	**16,550** (recom.)	**82%**	**10** months.
" " (land type)	15,850	—	10 months.

The Committee recommends the acceptance of the tender of the Stirling Boiler Co., Ltd., for one marine-type water-tube boiler, with chain-grate stoker, superheater, economiser, steel chimney, &c., at £16,550.

Sunderland.—Electricity Committee. Accepted :—

New Switchgear Construction Co., Ltd —E.H.T. switchgear.
Ferguson, Pailin & Co., Ltd.—L.T. links.
W. G. Farrow & Co.—Box frames and covers.
James Allan.—Box frames and covers.

Wolverhampton.—Corporation. Accepted :—

Six E.H.T. crucibles, £2,260.—Ferguson, Pailin & Co., Ltd.
Transformer oil filter, £178.—G. Lister.
One 500-KW. rotary-converter set, £3,210.—Met.-Vickers Electrical Co., Ltd.

FORTHCOMING EVENTS.

Battl Wallahs' Society.—Monday, June 21st. At the Holborn Restaurant. Luncheon (Mr. Guy Campbell will tell of his recent trip to the United States of America).

Institution of Electrical Engineers (Wireless Section).—Wednesday, June 23rd. At 6 p.m. At the Institution of Mechanical Engineers. Paper on "The Development of Thermionic Valves for Naval Uses," by Mr. B. S. Gossling.

Physical Society.—Friday, June 25th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Ordinary meeting.

Incorporated Municipal Electrical Association.—Annual convention at Bradford and Ilkley. June 21st to 25th.

NOTES.

Appointments Vacant.—Chief instructor in electrical installation and maintenance work, for the Bradford Technical College (£250) (training of disabled sailors and soldiers); chief telegraph inspector (Rs. 350 per month), for the Burma Railways Co., Ltd.; car-shed foreman for the London County Council tramways; assistant (£300 to £400) on the staff of the Institution of Electrical Engineers; evening lecturers in electrical engineering (Grades II and III), evening assistant lecturer (in one or all of the following: fitting and machinery, machine drawing, machine design, and practical mathematics), evening instructor in metal-plate work, Grade II evening assistant demonstrator in electrical engineering (labour) for the Goldsmiths' College, New Cross; technical assistant (Grade I) electrical branch (£300 + war bonus), ditto Grade II (£250 + war bonus), ditto Grade III (£200 + war bonus) for the London County Council tramways department; engineering draughtsman (£220 + £192), two ditto (£180 + £171) for Metropolitan Asylums Board; telegraph mechanicians (£440), for the Government of the Gold Coast Posts and Telegraph Department. For particulars see our advertisement pages to-day.

Hydro-electric Engineering.—Recently, at the request of Major C. E. Inglis, Professor of Engineering at Cambridge University, Mr. Douglas Spencer, of Messrs. Armstrong's Hydro-Electric Section, read a paper before the Cambridge engineering students on the subject of hydro-electrics and the British engineer, and at the close of the paper a selection of 12 candidates was made to undertake a journey to Norway to see Norwegian power plants, with a view eventually to a selection being made from their number to undergo a course of training in practical manufacture and construction in Norway.—*Financial Times.*

Birmingham Electrical Golfing Society.—The next competition will be held on the Castle Bromwich Course on Monday afternoon, June 21st, when the Electrical Trades Challenge Cup will be played for. There will be other prizes. The annual subscription is 7s. 6d., covering three meetings. Applications for membership should be addressed to Mr. W. A. Millinger (Hon. Sec.), 9, Livery Street, Birmingham.

Electrically-Propelled Ships.—The new U.S. battle cruisers *Saratoga* and *United States*, the keels of which have just been laid, will, says the daily Press, be equipped with a main battery of eight 18-in. guns. The vessels will be 850 ft. long, and of 43,500 tons displacement, with engines of 180,000 H.P., developing a speed of 33·25 knots. Four other battle cruisers, the *Constitution*, *Constellation*, *Lexington*, and *Ranger*, will mount main batteries each of eight 16-in. guns. All these ships are to be equipped to burn oil fuel, and are to be electrically driven.

A Corona Voltmeter.—An interesting paper in the May, 1920, issue of the American I.E.E. *Journal* describes an improved form of corona voltmeter. Precision measurements of crest values of high alternating voltage taken in the high-tension circuit are compared with the indications of the corona voltmeter. The law of corona has been determined to a higher degree of accuracy, and a modification in the form of the law as heretofore accepted is revealed. As based on the precision voltage measurements, the corona voltmeter is proposed as a natural secondary standard of high voltages. Its advantages as a standard, and its practical operation, are described.

Nickel-Plating of Aluminium and Aluminium Alloys.—Messrs. Guillet & Gasnier, in a paper read recently before the French Academy of Sciences, described some tests they had carried out to determine the possibility of obtaining satisfactory deposits of nickel on aluminium and its alloys. Another French worker had already obtained partial success by first scouring the metal in a solution of hydrochloric acid, but the resultant deposit was very uneven. The method of the two writers mentioned above consists in, first of all, sand-blasting the metal to be treated, the pressure of blast being 500 grams per sq. cm., and the sand just passing through a screen of 0·2 mm. mesh. This was followed by nickel-plating to a depth of some 6/100ths mm. The duration of the operation is half-an-hour, and the mean current-density 0·8 ampere per sq. dm. After this the nickel surface is copper-plated to a depth of 0·02 mm. for two hours, with a current density of 1 ampere per sq. dm., the surface obtained being carefully polished. The copper surface is then coated with nickel to a depth of 0·05 mm., the operation lasting for one hour, and the current-density being 0·5 ampere per sq. dm. Finally, the nickel-plated surface is polished. When this procedure is followed, the mechanical tests are satisfactory. The following were applied :—Penetration test for cracking; bending through an angle of 120°; burnishing. The chemical test consisted in subjecting the nickel-plated surface to a 15 per cent. solution of NaOH at a temperature of 100° C., and under these conditions the nickel-plating was found to be intact. The copper solution used in the tests in question consisted of 150 grams of copper sulphate, and 20 grams of sulphuric acid, with water to make up to 1 litre. The nickel bath was formed of 150 grams of double sulphate of nickel and ammonium and 50 grams of water, to make up to 1 litre.

Educational.—MANCHESTER COLLEGE OF TECHNOLOGY.—According to *The Times*, an important decision affecting the College of Technology has been taken. The college is a municipal establishment which has become the Faculty of Technology in the University of Manchester. Its degree courses have become more and more popular, and the college has attracted students from a wide area. It has, however, been urged that the development of the higher instruction of the college has been detrimental to the interests of young Manchester students not intending to take a degree course. The Education Committee has decided to recommend the City Council not to admit more than 80 new degree students at the Michaelmas term. There would be room, it is officially stated, for 240. According to one view, the question is whether the institution is to remain a college of University status, or fall to the rank of a technical school. The other view is that bright working youths of Manchester are losing the chance of technological instruction qualifying them for their trades, in order that the sons of the well-to do from the whole of the North of England may obtain degrees, partly at the expense of Manchester's ratepayers.

Celebration of Demobilisation.—Last Saturday afternoon the Manchester Corporation Electricity (Installation) Department celebrated the demobilising of the ex-Service members of the staff. A char-à-banc tour was arranged into "Peakland," and tea was taken at Buxton.

Inquiries.—Makers of the Morse push-button for marine signalling, Whyte & Thomson patent; motors using the mark R. D. M. Co.; and ironclad switchgear marked "W.W.," are asked for.

INSTITUTION NOTES.

Diesel Engine Users' Association.—The subject of connecting-rod bolts was further discussed at the last meeting of the Association. Mr. J. L. Chaloner thought that a definite period might be fixed, after which a connecting rod bolt should be subjected to a careful examination by means of suitable measuring marks, and that it should then be left to the discretion of the chief engineer whether the bolt was to be renewed.

Mr. Geoffrey Porter referred to the desirability of calculating bolt sections on the basis of the elastic limit rather than on that of the ultimate stress.

Mr. G. W. F. Horner submitted a sketch of an arrangement he had made use of in carrying out a series of tensile tests with loading conditions similar to those set up in the bolts under discussion, and a series of diagrams giving the results of the tests. He said that heat treatment of steel bolts should be carried out by experienced persons, as it was very easy to obtain a high elastic limit and ultimate stress with a very low percentage elongation, and these were undesirable conditions. With regard to the packing

Digitized by Google

pieces between the halves of the big-end bearings, it was advisable to use one uniform thick piece rather than a few thin pieces.

In a communication, Mr. Charles Day gave the results of investigations which had been carried out at Stockport for some time past with regard to connecting-rod bolts. He said that the material should be heat-treated in the bar; the bar being of uniform section, internal strains were avoided, whereas when bolts were heat-treated there was a danger of such internal strains occurring at the bottom of the threads, and at any other parts where changes of section occurred. Mr. Day condemned the practice of drilling only one pin hole through a bolt in connection with the use of castellated nuts. The castellations should be as numerous as the diameter would permit, and several holes should be put through the bolt. With regard to renewal of bolts, he thought that any general recommendation was illogical. Certain bolts might work with safety for many years, whereas other bolts failed after a very short time, the failure being due to the bolts having been subjected to improper conditions. He described a method of marking bolts so as to permit of accurate measurements being taken which would show at any time if they had been stretched or twisted. Whenever a bolt had been materially stretched or twisted it should be rejected and replaced by a new one.

The President (Mr. Charles Gould) announced that at the following meeting of the Association, Mr. A. Abbott, of the Department of Scientific and Industrial Research, would address the members on the general scheme of the Research Association for Liquid Fuels.

The Tramways and Light Railways Association.—The twelfth annual congress of the Association is to be held in the Council Chamber, Caxton Hall, S.W. 1, on July 2nd, at 2.30 p.m.

Institute of Metals.—A lecture on "Recent Progress in Thermo-electricity" was delivered by Prof. C. A. F. Benedicks, Ph.D., of Stockholm University, before the Institute on June 10th.

Prof. Benedicks first gave a short summary of his theoretical views upon the metallic conduction of electricity, which explained many matters not made clear by the former electron theory. A consequence of this new theory was that one had to conclude that even in a single homogeneous metal thermoelectric currents did occur; hitherto such currents were believed to be produced only when two different metals were present. Prof. Benedicks gave a concise demonstration of the most important experimental evidence of the truth of this conclusion, utilising for this purpose various metals.

In liquid mercury it had been possible for him definitely to prove the existence of thermoelectric currents, thus disproving the negative results of previous workers. A consequence of what the lecturer termed his "homogeneous thermoelectric effect" was that there must exist the reverse effect, the "homogeneous electrothermic effect," including as a special case the well-known Thomson effect. The reality of this effect was duly made clear. A specially interesting demonstration was of a new rotating thermoelectric apparatus, made entirely of copper, and rotating in a magnetic field, the driving force originating solely from unequal heating (by means of a tiny gas jet) of thin strips of copper.

The point at which the new knowledge brought forward by Prof. Benedicks might have some practical interest lay in the possibility of reducing the thermal conductivity of metals by insulated sub-division into fine wires without impairing the electrical conductivity. The demonstrations were carried out with the aid of a galvanometer provided by the Cambridge & Paul Instrument Co.

Liverpool Wireless Association.—A meeting of the Association was held on June 9th. As many members are now joining who have had no previous experience in wireless telegraphy, considerable time was devoted to coaching and assisting the "raw recruits," and it is intended at each meeting to set apart a certain portion of time for dealing with the very elementary stages of wireless for the benefit of new members, in order to make the subject attractive and popular to both old members and beginners. New members are cordially invited, and should apply to Mr. S. Frith, hon. secretary, 6, Cambridge Road, Crosby, Liverpool.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW *posted as to their movements.*

Major PHILIP DAWSON, M.Inst.C.E., M.I.M.E., M.I.E.E., upon whom, as stated in our last issue, the King has conferred the honour of knighthood in recognition of his services rendered as a member of the Disposals Board of the Ministry of Munitions, has been a member of that Board practically since its inception. Sir Philip is a man of boundless energy and enthusiasm, and his public activities are manifold. To electrical men he is best known by reason of his standing as an expert on electric traction matters, with which he has been practically and intimately connected ever since electric tramway and railway work really began to develop in the British Isles. His reputation is world-wide through his authorship of many well-known text-books dealing with electric traction and power supply. He is a partner in the consulting engineering firm of Messrs. Kincaid, Waller, Manville & Dawson, of Westminster, who are intimately connected with dock, harbour, electric traction, and power developments in Great Britain, South and North America, India, and Australia. The new knight, who may be relied upon to worthily carry so high a distinction, is, of course, well known as consulting electrical engineer to the L.B. & S.C. Railway Co., and is responsible for its electrification. He is also responsible for that of the Great Eastern Railway Co. He is further a member of the Railway Electrification Advisory Committee of the Ministry of Transport, and was appointed by the President of the Board of Trade as a member of the Water Power Resources Committee. In 1919 he was created Chevallier de l'Ordre de Leopold by King Albert for technical services rendered in Belgium during the war. He is Vice-President of the Belgian Royal Commission appointed by the Belgian Government to investigate and report on the electrification of the Belgian State railways and on the unification of Belgian electric power supply; President of the Association des Ingenieurs Electriciens of the Institut Electrotechnique Montefiore, Liége. Among many local and general activities we note that Sir Philip is one of the members of the L.C.C. for West Lewisham, and is on the Housing, Highways, and Electricity Committees.

Mr. E. MORGAN, of Dewsbury, has been appointed technical and engineering assistant to the Wolverhampton electrical engineer, at a salary (including bonus) of £500 per annum, increasing to £550 after twelve months' satisfactory service.

Wakefield Electricity Committee recommends that Mr. H. G. FRASER be appointed acting city electrical engineer for twelve months, at a salary of £550 per annum.

Mr. S. M. G. TEAL has been appointed deputy chief engineer to the Calcutta Electricity Supply Corporation.

The marriage took place, on June 11th, at the Cathedral Church of St. Mary, Glasgow, of Major H. R. TUPPEN, M.C., A.M.I.E.E., of Tanners Manor, Horeham Road, near Eastbourne, and Miss Elizabeth Rhind, younger daughter of the late Mr. Andrew Rhind, C.M.E., Bengal-Nagpur Railway, India.

Taunton T.C. has fixed the salary of the electrical engineer (Mr. HOWARD) at £450, plus the civil service scale of bonus, making a total of £660 a year, instead of his present salary of £520.

Mr. W. T. TALLENT-BATEMAN, who about a year ago was appointed works manager to Messrs. Dorman & Smith, Ltd., of Manchester, manufacturers of switchgear and accessories, has recently joined the board of directors, at the same time retaining his position of works manager. Mr. Bateman was formerly chief switchgear engineer to the British Westinghouse Co.

Mr. F. L. WARD, station superintendent with the W.D. Central Power Station, Aldershot Command, has resigned his position to take up an appointment in Africa.

Mr. HARRY S. ELLIS, who recently resigned the position of borough electrical engineer at Southampton under circumstances with which our readers are familiar, is joining his brother, Mr. Arthur Ellis, of Cardiff, who is in practice as a consulting engineer. The business addresses of both gentlemen are: 9, Park Place, Cardiff (head office), and 103, Cannon Street, London, E.C. Mr. Arthur Ellis's business, which has already developed to a very considerable extent, embraces electricity supply, tramways and transport work, and Parliamentary matters. Mr. Harry Ellis has been connected with the profession for twenty years or so. Prior to going to Southampton, a year ago, he held important appointments at South Shields, Bradford and Cardiff, where he was identified with electrical and mechanical engineering in shipyards, textile mills, public supply and engineering undertakings. He is a M.I.E.E. and M.I.Mech.E., and was for some years a member of the committee of the Newcastle Section of the I.E.E.

The Albert Medal of the Royal Society of Arts for 1920 has been awarded to Mr. A. A. MICHELSON, For.Memb.R.S., Professor of Physics in the University of Chicago, whose optical inventions have rendered possible the reproduction of accurate metric standards, and have provided the means of carrying out measurements with a minute precision hitherto unobtainable.

Obituary.—MR. J. W. PAYTER.—Australian papers just to hand record the death in April of Mr. J. W. Payter, who died at his home at Toorak, at the age of 87 years. The deceased received the first cable message which reached Australia. He retired from the State Public Service 27 years ago. He spent 38 years in the service of the telegraph department, and had reached the position of co-manager at the time of his retirement. At the time of the Boer war he was conducting experiments in wireless telegraphy.

MR. J. T. CROWE.—We regret to record the death from pneumonia, after a very short illness, of Mr. John Tudor Crowe. Mr. Crowe, who passed away on Friday last at his residence at Crouch End, London, was 66 years of age. He was staff manager of the Eastern Telegraph Co., and was well known in the electrical industry.

MR. H. A. JONES.—The death has occurred, as the result of an accident, of Mr. Herbert Alexander Jones, electrical engineer, of St. Kilda, Queen's Road, Buckhurst Hill, Essex. Mr. Jones, who was 49 years of age, was cycling home from the West Essex golf links, when he collided with a motor car, and he died on June 7th from the injuries he sustained.

NEW COMPANIES REGISTERED.

H. W. Smith & Co. (1920), Ltd. (168,161).—Private company. Registered June 10th. Capital, £60,000 in £1 shares (50,000 cum. pref.). To take over the business of electrical wire and cable manufacturers carried on by H. W. Smith & Co., Ltd., at Lydbrook, Glos. The subscribers (each with one share) are: H. W. Hill, 74, Grantham Road, Stockwell, S.W.9, clerk; E. Newton, 3a, Marysville Terrace, Colney Hatch Lane, N.11, solicitor. The subscribers are to appoint the first directors. Registered office: Lydbrook, Glos.

A. H. Hunt, Ltd. 168,116).—Private company. Registered June 9th. Capital, £40,000 in £1 shares. To carry on the business of gas, electrical, and mechanical engineers, electricians, automobile and motor car engineers, &c. The first directors are: A. H. Hunt (permanent director and chairman), Court Green, Court Hill, Banstead; C. H. Hunt, Court Green, Court Hill, Banstead. Qualification, 5 shares. Registered office: H. A. H. Works: Tunstall Road, Croydon.

Newcastle Electrical & Motor Accessories, Ltd. (168,103).—Private company. Registered June 8th. Capital, £5,000 in £1 shares. To carry on business as indicated by the title. The first directors are: W. E. B. Dove, 45, Woodlands Terrace, Darlington, electrical engineer; J. Cowper, 19, Dean Street, Newcastle-on-Tyne; T. Sloan, 103, Shrotridge Terrace, Newcastle-on-Tyne. Solicitor: A. M. Tait, 46, Grainger Street, Newcastle-on-Tyne. Manager: G. G. Gorrill. Registered office: 39, High Bridge, Newcastle-on-Tyne.

New Italian Art Association, Ltd. (168,003).—Private company. Registered June 4th. Capital, £15,000 in 10,000 10 per cent. cumulative preference shares of £1 each and 100,000 ordinary shares of 1s. each. To take over the Italian Art Association, Ltd., and to carry on the business of importers and exporters of and dealers in works of art, and in particular marble, alabaster, and other materials used in the manufacture of electrical fittings, &c. The first directors are: Sir Alan Hutchings, K.B.E., 0, Grosvenor Street, W.1; Lieut.-Col. the Hon. E. Thesiger, D.S.O., 16, Prince of Wales Terrace, W.8; Major-Gen. P. E. F. Hobbs, C.B., C.M.G., Barnaboy, Farnborough Park, Hants.; G. H. Gascoigne, Moray House, Adelaide Road, Surbiton; Capt. the Baron George Marochetti, M.V.O., O.B.E., 60, South Audley Street, W.; Lieut.-Col. F. Lucas, O.B.E., 26, Stanhope Gardens, S.W.7. Secretary: P. H. Goodwin. Solicitors: Kenneth Brown & Co., Lennox House, Norfolk Street, W.C.

A.R. Engineering Co. (Southampton), Ltd. (167,986).—Private company. Registered June 4th. Capital, £1,000 in 5s. shares. To carry on the business of engineers, electricians, &c. The subscribers (each with one share) are: J. B. Webb, 1, Telford Avenue, S.W.2 (director of Anglo-Russian Engineering Co., Ltd., and the Anglo-Russian Engineering Co., Birmingham, Ltd.); H. J. Veitch, 56, Moorgate Street, E.C.2, chartered accountant. The first directors are: J. B. Webb (chairman), H. Walker, and A. E. Webb. Registered office: 126, High Street, Southampton.

Hartford Engineering Co., Ltd. (168,085).—Private company. Registered June 8th. Capital, £5,000 in £1 shares. To take over the business of the Hartford Engineering Co., now carried on under the proprietorship of the Southport Electrical Supply Co., Ltd. The subscribers (each with one share) are: W. Sharrock, 17, Dunkirk Road, Birkdale, engineer; G. Pendleton, 19, Bridge Street, Southport, confectioner. The first directors are to be appointed by the subscribers. Registered office: Pine Grove, Southport.

Bukwood Engineering Co., Ltd. (168,084).—Private company. Registered June 8th. Capital, £1,000 in £1 shares. To carry on the business of tool makers, general and electrical engineers, &c., to adopt an agreement with G. St. J. Wood, W. J. Butler, and H. S. Kemshead. The first directors are: G. St. J. Wood, 29, Gunterstone Road, West Kensington, W., electrical engineer; H. S. Kemshead, 70, Cranley Gardens, Palmers Green, N.13, engineer; W. J. Butler, 17, Wayland Avenue, Hackney. Registered office: 31a, St. Jude Street, Stoke Newington, N.16.

Durelco, Ltd. (167,994).—Registered June 4th. Capital, £300,000 in £1 shares. To acquire all or the majority of the shares in, and the undertakings of Duram, Ltd., Cryselco, Ltd., and Metal Manufacturers, Ltd., carrying on business in England, and to carry on the business of manufacturers of drawn wire and electric lamps, and all articles made of molybdenum and other metal, &c. The first directors are: W. L. T. Arkwright, J.P., 4, Wilbraham Mansions, Sloane Street, S.W.; the Earl of Kintore, 10, Park Place, St. James's, S.W.; P. H. G. Powell-Cotton, Quex Place, Birchington; Capt. E. G. S. Churchill, D.L., J.P., Northwick Park, Blockley, Worcs.; G. G. Craig, 10, New Square, Lincoln's Inn, W.C.; W. W. Worthington, J.P., Maple Hayes, Lichfield; J. C. Moulden, 19, Carew Road, Northwood, Middlesex. Qualification, £500. Remuneration (except managing directors) £400 each per annum (£100 extra for the chairman) and 5 per cent. of the net profits divided between them. Solicitors: Speechly, Mumford and Craig, 10, New Square, Lincoln's Inn, W.C. Registered office: Thanet House, 231-2, Strand, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Penrith Electric Supply Co., Ltd.—Deposit on May 12th, 1920, of deeds of land in Friar Street, Penrith, to secure all moneys due or to become due from company to Lloyds Bank, not exceeding £2,500.

Richmond Light Manufacturing Co., Ltd.—Debentures dated May 14th, 1920, to secure £2,500 charged on the company's undertaking and property, present and future, including uncalled capital. Holder: A. K. Fordham, 90, Cannon Street, E.C.

Switchgear & Cowans, Ltd.—Issue on June 1st, 1920, of £3,000 debentures, part of a series.

CITY NOTES.

Siemens Brothers & Co., Ltd.

The report for 1919, which was submitted at the annual meeting on June 8th, stated that the result of operations, despite the dislocation caused by the change over from war to civil work, was quite satisfactory. Valuable contracts, notably for submarine telegraph cables, were secured, and output was well maintained. The Stafford works of Siemens Brothers Dynamo Works, Ltd. (of which all the capital is held by this company), had been sold to the English Electric Co., Ltd., and an agreement had been entered into between the English Electric Co. and this company whereby each company would confine its manufactures and trade to particular lines of electrical plant, and would have the support and assistance of the other company in obtaining orders for such business. The cottage property at Stafford, standing among this company's assets at £53,344, had been included in the sale at that figure. The agreement for sale was entered into in November, 1919, but the property had only been legally conveyed in this year, so that the values in the balance sheet in respect of it remained undisturbed at December 31st last. The Dynamo Co. would continue its existence for the purpose of completing its contracts for dynamos and motors, and for carrying on its other electrical business. The profit for the year was £211,209, plus £244,567 brought forward, making £455,776; 10 per cent. dividend for the year requires £100,000; there is written off from the discount on the sale of debenture stock £25,000, put to reserve £15,000, and carried forward to 1920 (subject to excess profits duty for 1918 and 1919) £315,776. Lieut.-General Sir Hubert Gough has been elected to the board.

In the course of his speech at the annual meeting, Mr. G. Mure Ritchie said that the balance sheet showed the company to be in a generally healthy condition. The net profit was £211,209, compared with £229,647 for 1918. All sections of the business had contributed towards the profit, which represented an average of 10 per cent. on the total capital employed in the business and about 8 per cent. on the turnover. The dividends and appropriations would absorb altogether £140,000, leaving a sum of £71,209 out of the year's profits from which to pay the excess profits duty to which the company might be assessable for 1919. Adding to that the balance of £244,567 from 1918 there was an amount of £315,776 to carry forward. In regard to the sale of the Stafford works of the company, the transaction arose out of lengthy negotiations with the English Electric Co., Ltd. That company was engaged in the manufacture of machinery for lighting and power purposes, whilst Siemens Brothers' manufactures at their principal works at Woolwich mainly consisted of telegraph and telephone plant, and electrical cables. A similar class of work to that undertaken by the factories of the English Electric Co. was carried on at Stafford by Siemens Brothers Dynamo Works, but inasmuch as modern developments in electrical power plant steadily tended in the direction of the manufacture of larger and even larger units, it became obvious to the directors that that branch of the company's business, while superbly well equipped up to a certain point, would require, if it was to continue profitable in the future, to receive extensive additions both to the works and to the staff. Under existing conditions it would have taken several weeks to build and equip new workshops and train new men for the work, and the expenditure would have been very great, involving the issue of further capital. They had made a friendly business arrangement with the English Electric Co. for mutual support. The Stafford works were sold at a valuation made by Mr. Michael Faraday on behalf of the company, and the valuation showed a substantial balance over the book figures. Dealing with the manufacturing work of the company, the chairman said that owing to the diversion for nearly five years of cable manufacture to war purposes, the demand since the conclusion of peace for submarine telegraph and telephone cables was very large, and substantial contracts had been completed, or were still in hand, for both those classes of cable for various Governments and cable companies, among which might be named the Danish and Norwegian Governments, for whom they had made special types of inductance-loaded submarine cables of a larger capacity than any hitherto made, and for the manufacture of which the plant was specially designed and erected. For electric light and power cables the demand was great and was still growing, and their manufacturing facilities had been employed to the utmost. That had also occurred in the case of the output required of them for the development of the telephone service of the Post Office, for whom they had made and laid cables in a large number of towns in the Northern and Scottish districts. That contract had further given considerable employment outside the factory, as it had necessitated the opening up of the thoroughfares, the laying of conduits and pipes, and the installation of telephone cables in no less than 50 towns. Like all other industries they had had special difficulties to face arising from the ferment in the labour world, affecting, on the one hand, the adequate and prompt supply of their raw material which they required in very large quantities, and on the other, the preparation of tenders covering manufacture extending over lengthy periods in a way satisfactory to their shareholders and fair to their customers. They might claim that those difficulties had been met and conquered, and as far as lay in their power their relations with their own employés were maintained on a friendly and satisfactory footing through the assistance afforded to their various committees, charities, sports club, &c. Their cable ship "Faraday" after repairing the Direct United States Co.'s cable in the summer, was employed during the autumn and winter carrying freight, but was now back again on her regular work of cable laying. In reviewing the business transacted by the cable sales department during the past year, it could reasonably be said that the result of the trading might be considered very satisfactory, and the turnover of the department for the year had exceeded that of any pre-war year, not only in value but also in regard to

Digitized by Google

the quantity and output. Among the orders secured during the year, one of particular interest was the contract for the supply and erection of the cables for the electrification of the Great Western Railway from Shepherds Bush to Ealing. They had also been successful in obtaining several large orders from abroad for extra high tension cables. A very considerable increase had taken place in the sale of cable accessories and joint boxes, particularly in the latter, and although that shop was considerably enlarged during the year it was still kept fully occupied. Several large contracts had been entered into with corporations and municipalities for their requirements in those goods. The trading in rubber insulated wires and cables showed an increase over any pre-war year both in value and mileage, and the sales were steadily improving. Special attention might be drawn to their "Stannos" wires, which were now in great demand all over the kingdom, and another of their manufactures which called for special mention was ebonite. The quality of their ebonite had now attained a reputation second to none, and the demand far exceeded the supply. Steps were being taken to meet the situation, and they hoped in the near future to be in a position to satisfy the requirements of all their clients. The battery business had been fully maintained. The connection which they enjoyed prior to the war had in the majority of cases been re-established, and the demand for their batteries was increasing. The construction of overhead lines for telegraph and power purposes had been revived, and there was every sign of considerable business, especially in the construction of power transmission lines. In the early part of 1919 they had to face the task of diverting their efforts from the supply of war material to the supply of those goods for the manufacture of which their works were originally laid out, and in that they met with the same difficulties as other companies. Raw material was hard to get and it was often of inferior quality, and output was diminished by the general compulsory reduction in working hours. However, in spite of all those difficulties, and of the long delivery times which they necessitated, the demand for their products was so great as to rapidly fill their order book. Their business in telegraph apparatus had revived satisfactorily, and continued as before to be almost exclusively for export, their chief customers being foreign Governments or railway administrations. Their business in wireless telegraph installations took a considerable step forward during the year, and continued to develop satisfactorily. The Post Office had placed considerable orders for telephone exchanges, of which they had secured a fair share, having booked no less than three public exchanges during the year. In conclusion, he referred to the fact that arrangements had recently been made which would ensure the manufacturing output of their lamps being doubled in the near future. The increased cost of labour and raw materials had, he said, reduced the net profits in comparison with the turnover made by the lamp department last year to less than half of that realised during the preceding year. That fact should appease the minds of any who, through the sketchy accounts concerning the report of the Standing Committee on Trusts, which recently appeared in the daily Press, might have formed the opinion that the company was profiteering in lamps.

Lord Queenborough seconded the motion, which was adopted without discussion.

Electrical Construction Co., Ltd.

Presiding at the annual meeting, on June 10th, Mr. James Gray, the managing director, said the balance of profit and loss account showed a small reduction on that of last year. Having regard, however, to the fact that during the two previous years the works had been operating up to their full capacity, there could hardly fail to be some set-back in profits this year, due to reduced hours of labour and the restrictions prevailing as to overtime, &c. The extensions of the works did not add appreciably to the output during the year, and the moulders' strike caused great disorganisation. The effects of this strike were still felt, but would, it was hoped, soon be overcome; and a larger turnover than ever was anticipated, though it must be kept in view that labour conditions would tend to modify the effect of the extensions which had been carried out. Comparing the past two years, the gross profits from manufacturing and contracting in 1919-20 were £121,764, and in 1918-19 £121,364, the increase being £400. The net profit decreased from £68,680 in 1918-19 to £66,169 in 1919-20. These figures showed that though the gross profit was practically the same in each of the two years, the net profit last year was £2,561 less than in the preceding year. This was accounted for by an increase of £4,992 in general charges, though there was a set-off of £1,183 reduction in debenture interest and maintenance of plant and machinery, and also of £898 additional dividends and interest and transfer fees. Having regard to all the conditions, the results were quite satisfactory. The net profits were £66,169, and the sum brought forward (after payment of £20,000 excess profits duty for the year ended March 31st, 1919) was £18,669, making a total of £84,839. Referring to various items in the balance sheet, Mr. Gray explained that the reference to proceeds of sale of leasehold property at Millwall, £5,398, concerned premises which were formerly sublet to the Electrical Power Storage Co., but had since 1916 been in occupation of a shipping company, which had made an offer to purchase, and this had been accepted. "Additions to plant and buildings, £44,883," included the extension of the works to which reference had already been made. It consisted of three bays, measuring in the aggregate 330 ft. by 110 ft. The beneficial use of these was not obtained as early as anticipated, but the whole of the switchgear department had now been transferred to the new shops and a greatly increased output from that department would be possible. When the shops had been completed they would be second to none in the country in lay-out and equipment, both of which were vital to cheap production. The item shares in allied companies had been reduced considerably, advantage having been taken of favourable offers to purchase. The company was not a holding company, and the proceeds of the sale could be more profitably employed in its own business. The shares realised a surplus over their book value, and this was applied in reducing investments to market value. On the liability side, the ordinary capital had been increased by the issue made in April, 1919; the debentures had been reduced by £8,000. The general reserve, with the present allocation, would stand at £100,000, equal to one-third of the ordinary share capital. The floating assets exceeded the floating liabilities by £326,913; a most satisfactory position. With regard to the payment of excess profits tax, when the war broke out the manufacturing electrical industry was emerging from a long period of depression caused by strenuous and unfair foreign competition, and the excess profits duty had, therefore, weighed heavily upon the industry in consequence of low pre-war standards. In the case of their own company, the sums paid in excess profits duty and munition levies since their incention, had exceeded the dividends to the ordinary shareholders after deducting income tax. It would be difficult to find words more forcible than those used by the Chancellor of the Exchequer last year in favour of abolishing the duty, but to the surprise of the community he had not only decided to continue it, but to increase it from 40 to 60 per cent. Every reasonable person acknowledged that the money had to be found, and was willing to pay his share, but he objected to an unfair distribution of the burden. Excess profits duty was imposed in a time of stress and served its purpose, but to continue it was a direct encouragement to extravagance, and it would not conduce to increased production, which was vital to the rehabilitation of the country's finances. The labour outlook was still uncertain, but their relations with their own men were quite satisfactory, and provided there was no dislocation by strikes or otherwise, they might look forward with complete confidence to the results of the new financial year. The speaker referred to the valuable services rendered by the staff and workmen during the year.

The report was seconded by Sir Henry Mance, and unanimously adopted.

Altrincham Electric Supply, Ltd.

During 1919 109 new installations were connected, making the number of actual consumers 1,940. After providing for debenture interest, &c., the profit was £6,913, plus £284 brought forward. After paying the preference dividend, and putting £500 to depreciation, a dividend of 7½ per cent. per annum is to be paid on the ordinary shares for the half year ended December, and a dividend of 5s. per share for the year on the deferred shares. £517 is to be carried forward. The revenue for the year was somewhat disappointing, as the price that the company was able to charge for current for domestic purposes was not commensurate with the increased cost of labour and coal, and during the first half-year the operation of the Household Fuel and Lighting Order adversely affected the revenue.

The recovery of industrial activity in the area has been unexpectedly slow, and this, in addition to affecting the revenue from existing consumers of electrical power, has delayed the completion of new factories being erected in the district, and to which the company are already supplying a certain amount of power. When the fresh capital was issued in July, 1919, it was anticipated that the major part of it would be required at an early date in payments for the extensions to plant. It has not yet, however, been possible to obtain delivery of the major portion of this, including a 2,000-kw. turbo alternator. A large proportion of the new capital has therefore been practically unproductive, and has been invested for the time being in 5½ per cent. Treasury Bills, and the anticipated increased profit for the past year has, for this reason, not been realised. The Broadheath district is continuing to find favour as a manufacturing centre, and, unless unfortunate set backs occur, the directors look forward to satisfactory results for the current year's working.

Delhi Electric Tramways & Lighting Co., Ltd.—For 1919 the gross receipts of the tramway undertaking were £15,092, and those of the electric supply undertaking £32,498; increases of 1¾ per cent. and 13 per cent. respectively. The tramway revenue was affected by the disturbances which occurred in Delhi in April, 1919. The combined undertakings show a net revenue of £20,430, as compared with £18,010 in 1918. After providing for general expenditure, debenture interest, depreciation, putting £2,500 to renewals reserve, and writing £5,000 off preliminary expenses, 7 per cent., less income tax, is paid on the preferred and participating shares, and 1s. 4½d. per share, less tax, on the ordinary shares, and £1,362 is to be carried forward. Additions to plant amount to £3,073. Further plant, equipment, and mains required to meet the growing demands have been ordered, and the question of providing for future developments is receiving careful consideration.

Manila Electric Railroad & Lighting Corporation.—Dividend of 1½ per cent. on the common stock for the quarter ending June.

Digitized by Google

United Electric Tramways of Monte Video, Ltd.—The report for the year ended March 31st, 1920, states that the credit balance for the year to October, 1919 (the fiscal year of the Uruguayan company), after providing for administration expenses and debenture interest is £86,344, plus £10,669 brought forward. £4,981 is applied to redemption of debenture stock; £2,500 to redemption of preference and ordinary share capital; £30,000 to renewals and contingencies; 6 per cent., less tax, is paid on the cumulative preference shares in respect of the year to September 30th, 1918, and 6 per cent. is recommended on the same shares for the half-year to March, 1919, and for the year to March, 1920; carried forward £7,032. The operation of the tramway system showed gross receipts at an exchange of $4.7 to the £ of £443,694, an increase of £63,394. The operating expenses were increased by £29,823, leaving a net increase of £33,571. Passengers carried 54,883,919, an increase of 6,955,313. Car miles run 7,756,634, an increase of 718,207. The decrease in cost of fuel has been less than was hoped for a year ago, while expenditure on repairs, maintenance, and wages has continued to advance.

Calcutta Electric Tramways, Ltd.—Presiding at the annual meeting in London, on Monday last, Sir Henry Kimber, Bart., said that the capital outlay of the year, £9,671, was small as compared with the increased revenue earned. The traffic receipts increased by £39,581 on a mileage run increase of 21 per cent. The passengers carried increased by nearly 7 millions to 50 millions. They were now considering the question of overhauling the power house with a view to providing more up-to-date machinery or other facilities to meet the growing traffic. In regard to the prospects for the current year, the traffic receipts continued to improve, the increase to date being over 1¼ lakhs. In order to meet the growing morning and evening traffic they had ordered eight motor 'buses, which they hoped to have ready to start a service during the latter half of the year. The costs of running were, of course, much higher than those of the tramway service, but the experiment would be closely watched with a view to the extension of the service if it was warranted by results.

Prospectuses.—*A. Reyrolle & Co., Ltd.*—The prospectus has been advertised for the issue at par of 160,000 £1 ordinary shares in this well-known company of switchgear manufacturers. The demand for the company's product since the war has exceeded all previous records, both in quantity and value. The works at present cover five acres, and the employés number nearly 1,000. The proceeds of the present issue will be devoted to completing the extensions and providing working capital. Very full particulars were given in our advertising pages last week.

The lists will be closed on Saturday, June 19th, but applications received by post on Monday, June 21st, will receive consideration.

W. Canning & Co., Ltd.—The list is to close to-morrow, Saturday, in an issue of 200,000 ordinary shares of £1 each at par, in this company, which has been formed to acquire the old-established business of W. Canning & Co., of Birmingham and London, electro-platers' engineers, manufacturers of electro-plating plant and materials, &c. The issue will provide additional capital in respect of premises purchased in London, for extensions to meet increasing trade, and to enable the practice of carrying large stocks to be extended. Particulars of the registration appeared in our last issue (page 757).

Marconi's Wireless Telegraph Co., Ltd.—The report for 1919 shows that the credit balance of profit and loss account amounted to £1.220.740. The total distribution on the old ordinary shares is 25 per cent. for the year, on the preference 22 per cent., and a bonus of 5s. per share, without reduction of income tax, is to be paid on the old ordinary shares and on the preference shares.

Kalgoorlie Electric Power & Lighting Corporation, Ltd.—For 1919 there is a decreased profit. It fell from £10,622 in 1918 to £5.451 mainly on account of the closing down of the principal mines by reason of labour troubles. Since the strike ended early this year the returns have shown an improvement.

Lewes & District Electric Supply Co., Ltd.—Total revenue £5,013; working expenses £3,856; balance to net revenue £1.156. After meeting debenture interest, &c., and adding £868 brought forward, £600 is put to renewals fund, and £837 is carried forward.

Stock Exchange Notices.—The Committee has specially allowed dealings in the following under temporary regulation 4 (3):—

Mather & Platt, Ltd.—450,000 ordinary shares of £1 each, fully paid, Nos. 600,001 to 1,050,000.

La Plata Electric Tramways Co., Ltd.—After meeting debenture interest the net profit is £3,024, plus £7,628 brought forward. Both sums are to be carried forward.

Globe Telegraph & Trust Co., Ltd.—Dividend of 14s. per share on the ordinary shares, making 10 per cent. total for the year.

Lancashire Power Construction Co., Ltd.—Dividend at the rate of 6 per cent. per annum for 1919 on the ordinary shares.

Ruston & Hornsbys, Ltd.—Dividend on the ordinary shares at the rate of 5 per cent. per annum. To credit of employés' aid account, £1,000; £41,175 to depreciation on buildings, plant, and machinery; carried forward £37,240.

Companies to be struck off the Register.—The following is to be struck off the register within three months unless cause is shown to the contrary:—

Autoelectric Transmission, Ltd.

Coventry Chain Co., Ltd.—Interim dividend of 6 per cent. per annum, less tax, on the preference and ordinary shares for the half-year.

Howard & Bullough, Ltd.—Final dividend on the ordinary shares, making 10 per cent. for the year. £57,207 carried forward.

James Keith & Blackman Co., Ltd.—Dividend on ordinary shares for year ended March, 1920, at the rate of 20 per cent. per annum, free of tax. To reserve £13,780; forward £18,559.

C. A. Vandervell & Co., Ltd.—Dividend of 10 per cent. per annum, less tax, for the quarter ended June 30th on 10 per cent. preferred ordinary shares.

Provincial Tramways Co., Ltd.—Interim dividend of 8d. per ordinary share.

STOCKS AND SHARES.

Tuesday Evening.

The Stock Exchange is troubled with a good deal of selling from somewhat mysterious sources. Apparently the liquidation emanates from Paris, but it is so persistent and so heavy that suspicion arises as to whether some, at any rate, of the sales are inspired near home. The outlook in regard to money is unchanged, though there does seem to be some awakening on the part of the Government to the fact that trade will be much better served by cheaper money than it can be by the Bank Rate rising. Consequently, optimism is already beginning to talk about a fall, instead of a rise, in the Bank Rate, though the position is still sufficiently unsettled and obscure to cause hesitation on the part of investment or speculative enterprise.

There is a breath of improvement in the issues of the Underground Electric Railways Company, on the assumption that the company is bound to be allowed to put up its fares before very long, and that when this is done, the enormous volume of traffic handled will begin to make itself felt. As soon as profits do come into the picture, they should be on the substantial scale, and the speculative investor is prophesying a return, sooner or later, to the days when the Underground Company paid 6 per cent. on its income notes. For the next half-year, or the next few half-years, it may be safely conjectured that these Notes will receive considerably less than their proper dividend, but the price, in anticipation of the fare-raising being conceded, has hardened to 59½, while the shares at 1⅛ are ⅛ higher. The shilling shares, on the other hand, are easier at 4s. 6d.

The talk of serious financial trouble in Paris has caused Brazil Tractions to recede to 49. Other Brazilian issues are also dull and heavy, apparently in consequence of the delay which has occurred in allowing Brazilian companies to raise their freight rates. The strength of Anglo-Argentine Tramways is scarcely maintained, the first preference losing 2s. 6d. of the recent advance, but British Columbia deferred at 49½ and the preferred at 50½ are 4 and 2 points higher respectively. Mexican issues are no better. Indeed the tendency is for them to slide back, with the exception of Mexico Tramways 6 per cent. bonds, which have gained 2. The Calcutta Tramways raises its dividend from 8½ per cent. to 10 per cent., free of tax, and the price is firm at 7⅞. The report is an excellent one. Bombay Electric Tramways preference at 13 are 5s. lower.

Of the new cable shares, Westerns are 4¾, Globes 4¼, Eastern Extensions 4 and Eastern Telegraphs 9s. 6d., with a fair amount of business doing in them all. Amongst the senior stocks, Eastern ordinary has given way to 147½, a fall of 3 points, and Eastern Extensions at 14¼ are 10s. lower, though Westerns remain at 15½. The principal excitement in this market, however, has been another rise in Marconis, the price putting on 3-16 to 3⅛. The company's report is exceedingly good. The dividend is made up to 25 per cent. for the year on the ordinary shares, and these, together with the preference, receive in addition a bonus of 5s. per share paid free of tax. The market has been strong for some two or three weeks past, and the price has come up from 3 to 3⅛ with scarcely a break. The new shares, which rank equally with the old as soon as the latter have received the dividends just declared, stand at 3⅛, the same price as the preference shares, which are to receive 22 per cent., and the bonus just mentioned. Canadian Marconis are 10s. 3d. and Marines 38s. 9d., the latter showing a distinct disinclination to respond to the recent good report. No particular heed is paid in the Stock Exchange market to the strike of Marconi operators.

Digitized by Google

It may be well to point out that the calculation of the yield on Marconi shares, in our tabular list, takes no account of the 5s. bonus. The return is worked out on the 25 per cent. dividend only.

Amongst the manufacturing shares, Callenders have attracted a little attention and a rise of 1-16, in consequence of the new issue, while the report shows up well. It is interesting to notice the available balance during the past four years from 1916 onwards, and the annual figures are: £311,444, £207,491, £232,978, £262,803. For 1913, the year before the war, Callender's had £170,000 to dispose of, and the dividend then was 15 per cent., the same as it is in respect of the year just ended, the latter, of course, including the new shares distributed by way of bonus some time ago. Castner-Kellners are weak at 3¼ ex dividend. Babcocks at 2⅝ xd show little change, allowing for the deduction. Henleys have risen ½ to ⅞. Siemens at 26s. show recovery of the 1s. dividend, while Telegraph Constructions are £1 lower at 21½ owing to monetary conditions.

Electricity Supply shares are unchanged, from Bromptons to Westminsters. Nobody is taking any interest in them. The strike which has plunged Melbourne into nightly darkness failed to influence the price of Melbourne Electric Supply shares. The rubber share market is quiet to dull, with the price of the commodity once more a trifle below 2s. per lb. Armament shares are weak, Vickers and Armstrongs both giving way on provincial sales. In these, as in many other of the Stock Exchange industrial departments, business is slow; prospective buyers profess that they prefer to wait and see whether the 60 per cent. E.P.D. will remain, or whether the continuance of vigorous attacks may force its partial abandonment even at this twenty-fifth hour.

A "Meteorite Mystery."—On Wednesday, May 26th, there was an excetionally heavy thunderstorm at Chiswick, which was recorded in the Press under such headings as "Meteorite Mystery at Chiswick.—Strange Occurrence in Great Storm.—Fireball Seen to Fall," and was followed by a visit of "two eminent scientists" from the British Museum and Meteorological Office, to investigate. They doubted the meteoric cause of a hole in the ground that was found after the storm, but were said to be puzzled. The affair went the round of the Press—the terms "meteorite, fireball, thunderbolt" being applied.

Mr. Walter Betts, of Chiswick, informs us that visiting the scene at a convent on the Friday following the storm, he found a gardener filling in the hole. Close to the hole was a cemented path joined at right angles by a similar path from a paved courtyard, forming a sort of funnel with the outlet towards the hole. As from each direction there was a slight fall towards the corner where the hole was made, this spot would be the first soft and cultivated ground to be submerged by the direct downfall of rain thus collected. The roof-gutters overhanging the cemented paths would be overflowing, and two gutters meeting at the angle of the building just opposite the hole would form a pointed "jug-spout" from which the water would be projected on to the soft ground from a height of 18 or 20 ft. With such combined forces the soft soil would inevitably be washed out or down any subterranean hollow, such as an old drain. And so the hole can be accounted for. It was, in a double sense, a "wash-out." As to the "thunderbolt" itself, just before the great flash, a particularly dense cloud, at a low altitude, was approaching from the south-east. It probably passed over the convent, then, some 400 yards beyond, was discharged all at once with one tremendous flash and almost simultaneous clap. Mr. Betts's house, about three-quarters of a mile from the convent, was considerably shaken, and there was a torrential downpour of rain. After this abated, although the heavy rain continued for some time, there was not much lightning.

WHERE AMERICA LAGS BEHIND.

[COMMUNICATED.]

We are so used to having it dinned into our ears that America is the home of every electrical virtue, and has originated every worth-while improvement and development, that it may not be an easy task to make people believe that at least one of her feet is formed of unsubstantial clay, or (to employ a more appropriate simile), of bituminous compound.

In some ways America is ahead of this country electrically. The natural wealth, large population, and the important fact that a very big proportion of American buildings have been erected during the last 30 years, are sufficient to account for the wider use of electrical service on the other side of the herring pond. Electrically, America has not had to contend, as we have here, with a strongly entrenched and admirably organised gas industry, which has piped every town in the country, and has established a sort of dingy but sacred tradition in ninety-nine houses out of every hundred.

Apart, however, from the question of extent of use, America lags, in many ways, behind English practice. Particularly is this so in what may be called the refinements of electric lighting—the little contrivances which mean so much in the way of convenience and adaptability. With regard to switches, for example, America is apparently only just realising the superiority of the tumbler switch for ordinary domestic use. At least, one must infer this from recent advertising in American papers, calling attention to a new form of switch, which can be turned on with the elbow if the hands are otherwise engaged.

In small houses and apartments, and probably in some large ones, wall switches do not seem to be used at all. Instead, the fittings are equipped with pendant switches which have to be found and operated in the dark. This has led some clever person to place on the market phosphorescent pins or tabs which can be attached to the switches. It is extraordinary that, in a country which is supposed to be teeming with genius, such alarming stupidity should be exhibited in the use of electric lighting; that its outstanding advantage of easy control should go almost unregarded. No doubt it is a little cheaper to dispense with wall switches, but cheapness is certainly not the ruling motive of American industry; indeed, the general tendency is to spend a great deal of money in order to save a little time or work. As evidence of this, one has only to consider the enormous sales of electric washing machines at an average cost of about £40. The only probable explanation of America's deficiency in wall switches is that people have simply not realised the, one would have supposed, evident advantages of being able to control the light at the entrance rather than at the end of an adventurous and frequently damaging passage half-way across the room.

In the matter of wall plugs, too, the American user of electric light is unfortunately situated. At present there is a sort of crusade in progress, advocating the installation of what are called "base-board outlets." Reading the advertisements and booklets issued in support of this propaganda, one is forced to the conclusion that, in the average American household, small cooking appliances, fans, portable lamps, &c., are generally connected to the lampholders of ceiling fittings. As these lampholders are always of the Edison screw type, one can imagine the disproportionate amount of trouble involved in connecting up, say, a hot-plate or hair-drier which is only wanted for a few minutes.

One visualises the average American house as being replete with every conceivable sort of electrical appliance, from a washing machine to an electric chair for the removal of superfluous kittens; and, if all these devices are connected to lampholders, our trans-Atlantic cousins must pass their lives amidst trailing clouds of flexible cord, using their lamps only on those rare occasions when the holders are not otherwise occupied.

With relief one notes that, as in the case of the switch, English practice is just beginning to find favour, and that a two-pin wall plug has recently been evolved. This, if generally used, will probably save a lot of time hitherto wasted in screwing home the absurd contraption at present employed. Unhappily, the American designer, although he had sufficient intelligence to see somewhat belatedly the advantages of the two-pin idea, seems to have made rather a bad job of the actual manufacture. Instead of providing substantial split pins, as in the English variety, he went in for thin brass strips which are bound to crumple up should one miss the holes at the first plunge.

America prides herself on her progress in the development of electric lighting fittings, and certainly in this respect her complacency is not altogether unjustified. Even in this department, however, she seems to have overlooked some of the small conveniences to which we in this country are accustomed. The counter-weight pendant, for example, is almost unknown in America; yet for certain purposes it is extraordinarily useful. It seems that the insurance companies are supposed to have some objection on the score of fire risk; but, as a matter of fact, this risk is practically non-existent. At any rate, the counter-weight is considered, and indeed has proved itself, to be entirely safe in this country.

It is possible that the Americans possess certain lighting conveniences of which we are as yet ignorant, but nothing they have could neutralise our advantage in the matter of intelligent switch design and location, and the free use of wall-plugs.

Apart from the lack of certain devices in America, there is also observable a degree of crudity and bad workmanship in electrical accessories which would be quite inconceivable in this country. Of course, many wiring accessories used in England are poorly made, but, in comparison with the fragility and unsound construction of the American varieties, they seem to be almost perfect. The threads of English lampholders, switches, &c., for instance, are often a source of irritation and delay, owing to insufficient tapering, but at least they *are* threaded and, once assembled, will remain so indefinitely. In the States, however, many devices, such as pendant switches, are made to fit together like a cigarette case or blacking tin. That is to say, there is no thread, the parts being kept together by the coincidence of a niche and a projection. Such a method of securing (save the mark!) the cover of an electrical device is simply abhorrent to the English mind.

To sum up, it may be said that America has advanced a great deal more than we have in the variety of its electrical applications, and in the degree of electrical saturation achieved in the larger towns. But no single wiring device has been perfected; while such matters as the design and convenient arrangement of switches and wall-plugs have been almost entirely ignored. The home of the multi-millionaire may be an Aladdin's cave of electrical delight, but the ordinary middle-class homes in America, although they may contain many heating and cleaning appliances rarely seen in this country, are a long way behind their English "opposite numbers" in respect of some of the elementary conveniences and refinements of electric lighting. In America, lighting seems to be a cheap and hastily arranged means of inducing the consumer to use an electric washing machine. In England, electric lighting is an end, and a very excellent end, in itself; although we must not, for that reason, allow ourselves to overlook the economic necessity of persuading the people of this favoured isle to use electricity for other purposes.

THE DESIGN OF A SUPER-POWER STATION.*

By H. GOODWIN, Junr., and A. R. SMITH, of the General Electric Co., U.S.A.

THE general tendency towards the consolidation of existing power plants and transmission systems and the probability of the construction of super-power lines will undoubtedly result in the erection of large generating stations which can be operated at practically full load throughout the year. Whether such plants be located near coal mines where fuel is reasonably cheap or in localities where the transportation cost of fuel is considerable, the fact that the load factor is high will justify the construction of a most economical plant.

Apart from the economy of fuel based entirely on its present value per ton, consideration must be given to its possible value many years hence. Another fact that is often lost sight of is that the more coal consumed per kilowatt-hour the greater must be the capacity of boilers, stokers, and coal and ash handling facilities; and the greater the steam consumption the larger the piping, condensers and water tunnels. In brief, the cost of much of the apparatus that is necessary only for economic reasons may be largely offset by the reduction in cost of the essential apparatus because of the reduced demands on it.

The design herein described was developed for a particular condition where some of the fundamental considerations were: High fuel cost, moderately good load factor, extreme river floods, and high voltage underground distribution. This design is of recent origin, and has therefore not been fully developed; consequently some of the apparatus shown, particularly the boilers, economisers and pre-heaters, are proposed designs.

The more unusual features of the design are:—

High steam pressure, 350 lb.
High superheat, 350 deg. F.
Independent power supply for station auxiliaries.
Air pre-heaters for stokers.
All auxiliaries electrically driven.
Minimum overhead coal storage.
Simplicity of boiler-room building.
Outdoor switchgear for 66,000-volt distribution.
Means of cleaning circulating water tunnels and possible utilisation of circulating pumps in case of flood.

The ratings of the principal pieces of apparatus are:—

Seven main generators of 35,000 KW., 0.8 p-f., 43,750 K.V.A. capacity at 13,200 volts, 3-phase, driven by steam turbines.

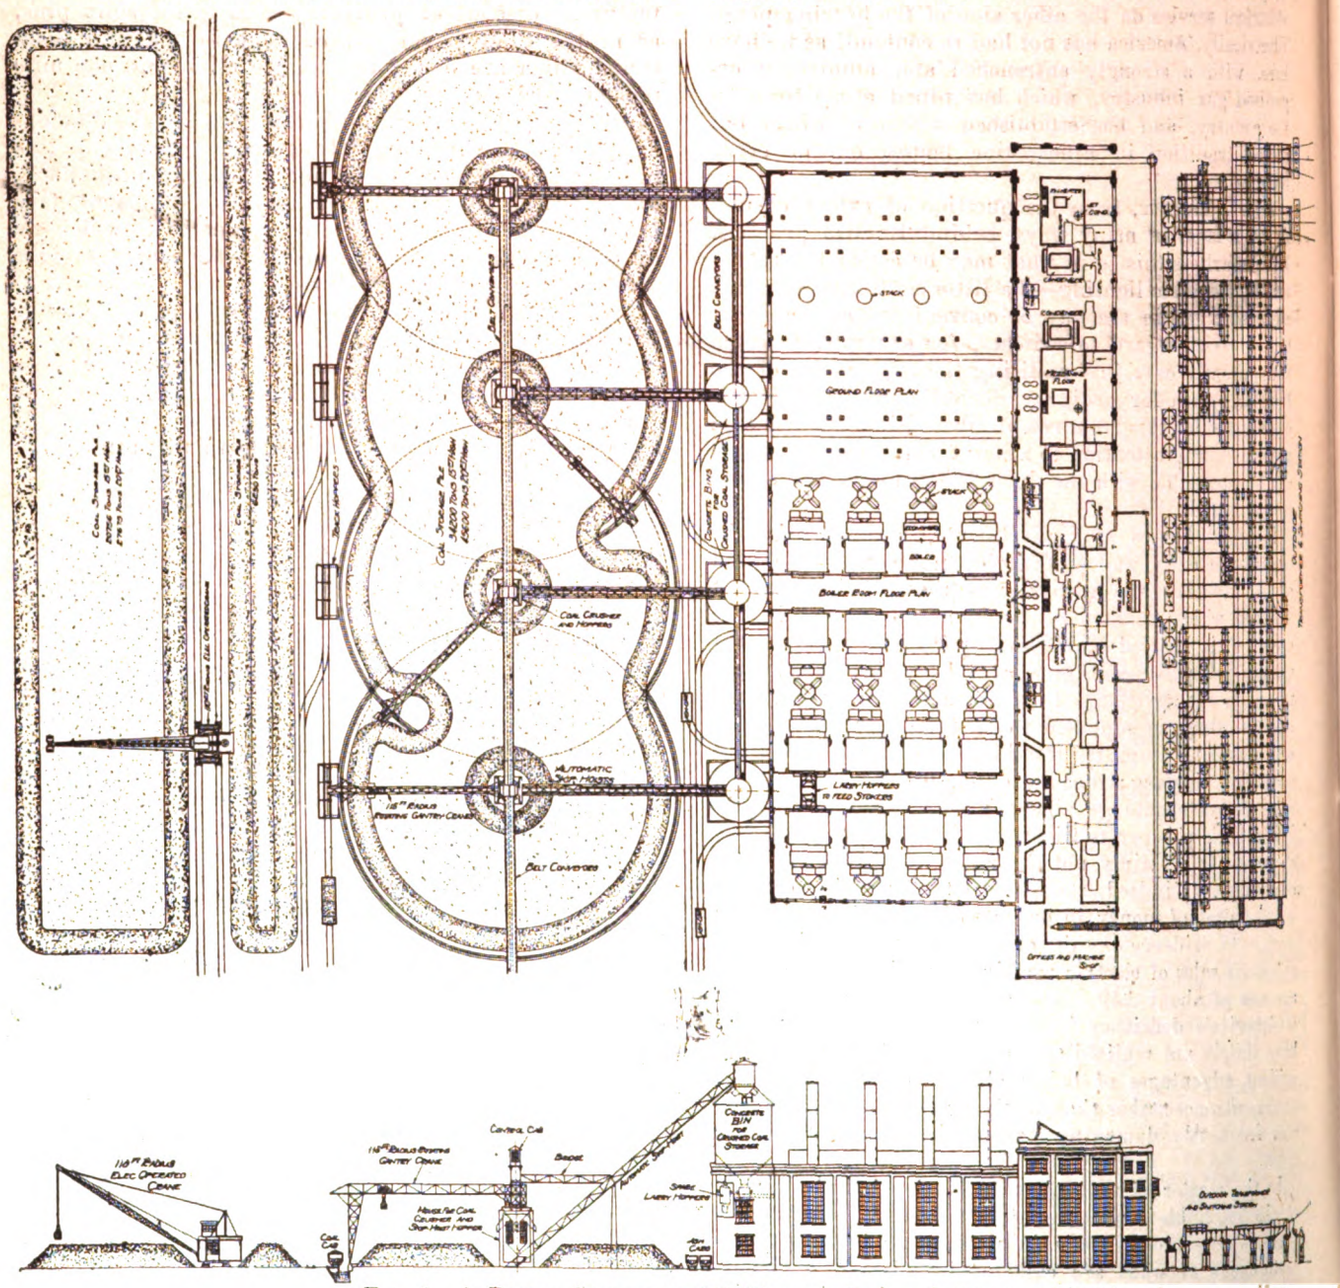

FIG. 1.—A POWER STATION OF 245,000 KW. PLAN AND ELEVATION.

Seven 45,000-K.V.A. transformer banks for stepping from generator voltage to 66,000 volts, each bank composed of three 15,000-K.V.A. single-phase units. One generator and one transformer bank are designated as reserve capacity.

Ten underground and two overhead feeders, all at 66,000 volts. The underground feeders will each be composed of three single-conductor underground lead-covered cables and will have an individual capacity of 45,000 K.V.A. The overhead feeder capacity is approximately 10,000 K.V.A. each.

The coal-handling equipment has been designed with the idea that the bulk of the coal will be unloaded from barges by means of travelling crane towers at the dock and transported by two belt conveyors directly to the four receiving hoppers and crushers. Fig. 1 shows the construction. There

* From the *General Electric Review*, May, 1920. Abstract.

Digitized by Google

are no travelling trippers, as all belts are dead-ended. From the receiving hopper the coal is delivered directly to the outside storage or through a crusher and skip hoist to the overhead outside bins. These overhead bins are connected by an emergency belt conveyor so that in case of failure of a skip hoist, a crusher, or any part of a receiving hopper tower, the crushed coal can be transported from the adjacent overhead bin.

The intention is that one operator located in a control cab above each receiving hopper will operate the revolving gantry crane, the crusher, the skip hoist, &c. Another operator will be located on each electrically operated larry to transport and weigh the coal from the overhead bins to each boiler. The emergency coal storage handled by the locomotive travelling crane will be operated only when the excess coal is being stored or reclaimed.

It will be observed that the revolving gantry crane reclaims the coal from the circular storage without moving the bridge; thus, this method is very rapid when reclaiming coal, although in distributing the coal the bridge will have to be moved slightly from time to time, but to minimise this movement outside shoots are shown on the four sides of each receiving hopper tower. The revolving gantry cranes overlap so that coal can be transferred from one pile to another. The design shown can be partially built and extended from time to time without interfering with operation, or without changing existing structures.

high price of fuel than by the high load factor. Where the load is uniform the stokers must have a greater relative combustion area.

With the use of economisers and preheaters, induced-draught fans will be necessary because of the increased draught loss and the low temperature of gas entering the stacks. These fans might be of the ordinary plate type, or possibly of the multi-vane type, because the temperature is low and the pressure comparatively high. However, the induction type of stack employing high-pressure blowers may be substituted.

Both the induced-draught fans and the stoker blowers are in duplicate for each boiler, although each would be of only half the maximum capacity required per boiler.

Wrought tube economisers of the same construction as the boilers, that is, with headers inclined with relation to the tubes, are proposed. The economisers will be practically the same width as the boilers; thus, there will be no change in the sectional area of the flue connecting the boiler and the economisers. The economisers will be cleaned with steam soot blowers instead of scrapers, and it is anticipated that there will be no moist soot deposit because the water entering the economisers will first be heated to 150 deg. or 160 deg. with exhaust steam, thus bringing the temperature well above the dew point of the gases.

Special attention is called to the natural thermo-siphon flow of water in both the vertical tubes and the headers,

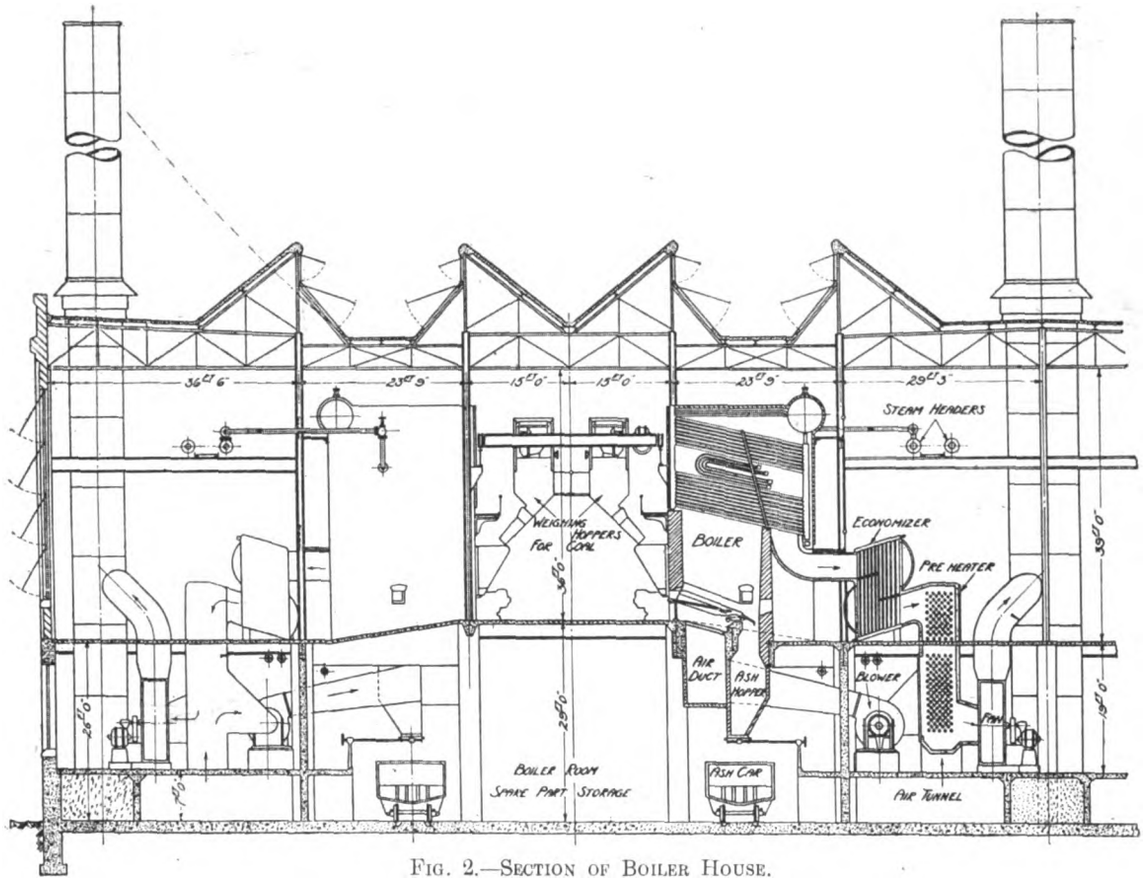

Fig. 2.—Section of Boiler House.

It is proposed to dispense with all kinds of ash conveyors, which are at best troublesome. The ash hopper under each boiler will be of such capacity as to contain 12 or 24 hours' storage so that ashes need be removed only once or twice during the day. The ash hoppers will empty directly into standard railroad cars, which will be hauled by a storage battery locomotive.

The boilers (shown in figs. 2 and 3) will have a rating of some 1,600 H.P. or 16,000 sq. ft. of heating surface. The proposed separation of the two banks of tubes with the superheater between is suggested for two reasons: First, to permit using a two-pass boiler and keep the economisers on the main floor, which means a greater number of tubes in height; second, to get a high amount of superheat without an excessive amount of superheat surface. The baffling of this boiler is simple. All of the heating surface should be effective, as there are no idle pockets, and the draught loss, because of the two passes instead of three, will probably be less in spite of the fact that the boilers may be several rows of tubes higher than the usual standard.

Four boilers per turbine are shown, but as there will be one spare turbine, there will naturally be four spare boilers, and some steam may have to be transmitted through the interconnecting steam header.

The "extra long" underfeed stoker has been shown, as the grate area must be commensurate with the increased heating surface resulting from a very high boiler. In this case the demand for economy was prompted more by the

and the counter-current flow of the gases and the water in the economisers; also, to the convenience of piping the feed water from the headers in the basement through the economisers to the boiler drums.

To avoid internal corrosion of the wrought steel economiser tubes, it is proposed to eliminate as completely as possible all air from the feed water, either in the condenser or between that and the economisers.

The air from each turbo-generator is discharged into a duct leading from the generator room to the end of the boiler house. This is shown clearly in fig. 3. The tunnel is shown in section in fig. 2. The far end of this duct, being open to the atmosphere, gives a free discharge for the generators in case no blowers are in operation, and any air required for the boilers over and above that supplied by the generator will be taken in at this end. From this main duct the air passes through the heating tubes in each preheater, the preheater being divided into two units per boiler to make a more practical design. With this arrangement the boilers nearest to the turbine room will burn the heated air discharged from the generators, whereas the boilers at the far end will burn the air from outside.

Preheaters have not been in general use in stationary plants, although they have been applied for many years on board ship. If the cost of coal is at all high, they can undoubtedly be made to show a good return on the investment.

On account of the high pressure and high superheat involved, it is proposed to simplify the steam piping as much

Digitized by Google

as possible. There are no steam headers in the general sense of the word, but there is a transfer header for equalising pressures and transferring steam between boiler rooms. The omission of all steam-driven auxiliaries except the house or auxiliary turbines, of which there is one for every two main units, greatly simplifies the steam piping, and materially reduces the cost of the plant.

should be arranged so that either one can be taken out of service for cleaning or for repairs. This statement applies most forcibly to the intake tunnels, which invariably fill up with sand or silt. Sluice gates have therefore been shown connecting between the intake tunnels and a centre chamber. There is one centre chamber for each main turbo-generator; thus, any one or all the circulating pumps can get suction

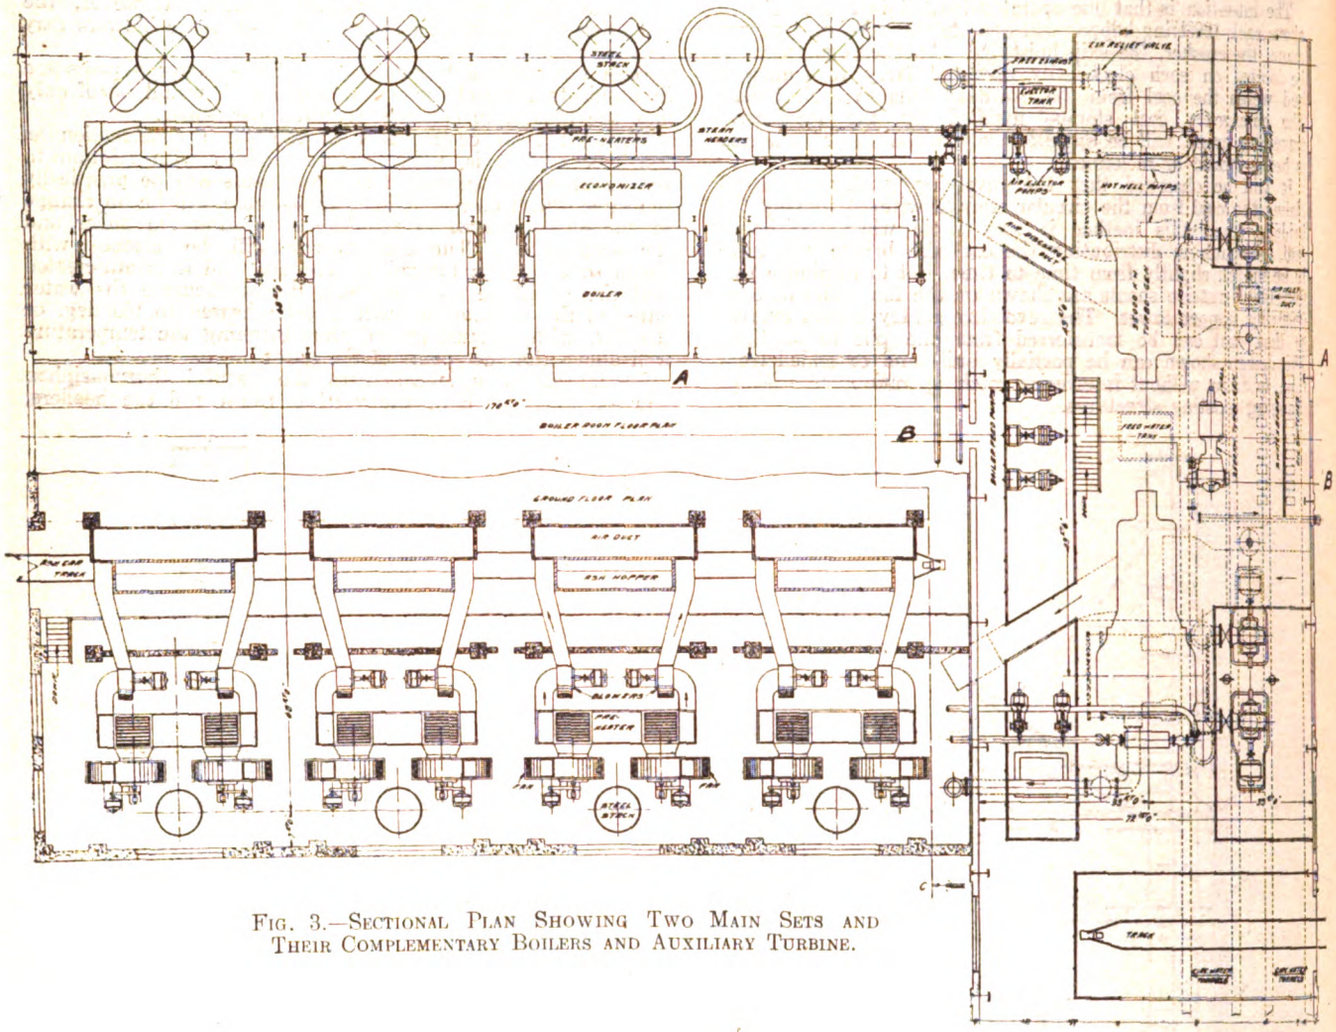

Fig. 3.—Sectional Plan Showing Two Main Sets and Their Complementary Boilers and Auxiliary Turbine.

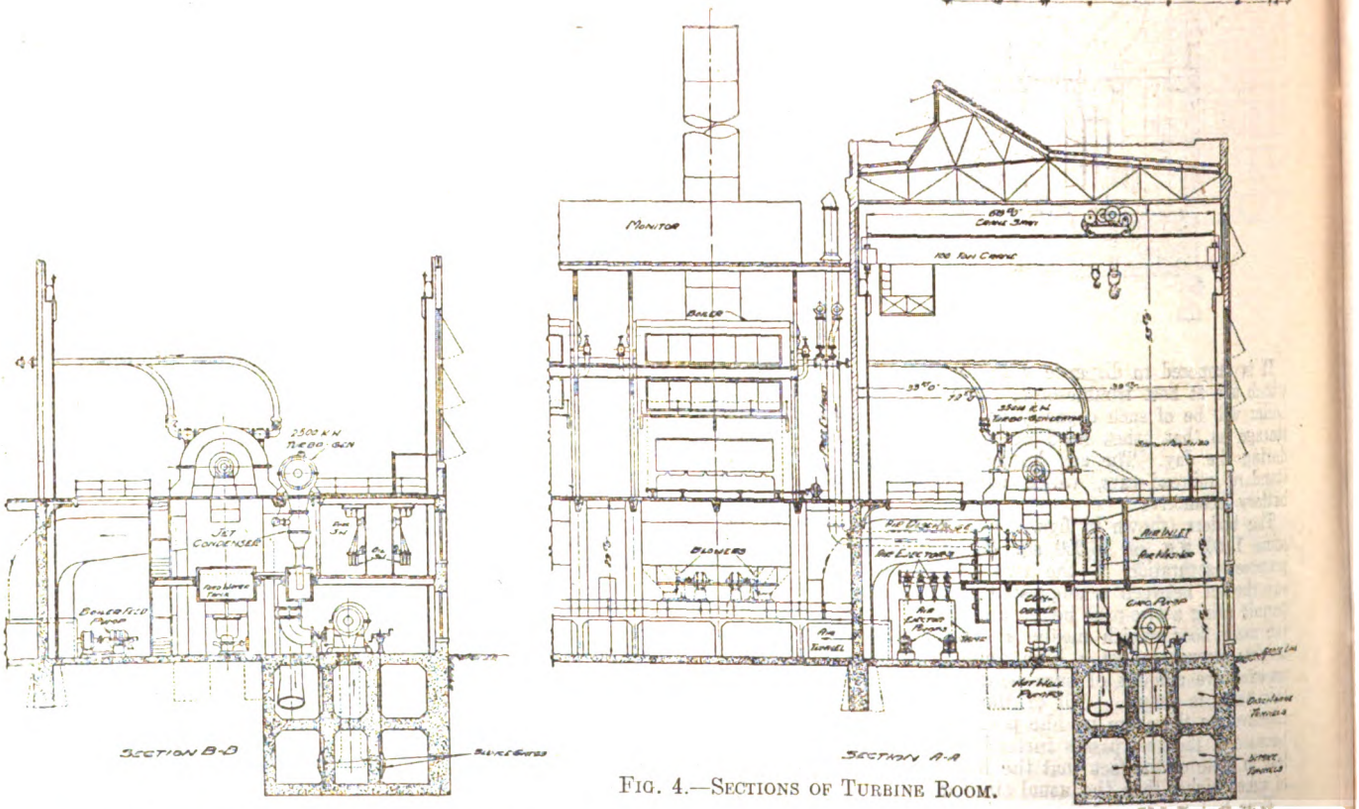

Fig. 4.—Sections of Turbine Room.

There is a group of feed pumps for each boiler room. The piping, therefore, can be segregated in a most advantageous manner and the sizes of the pipes kept very small.

Fig. 4 shows a cross section of the turbine room, and below this the circulating-water tunnels. On account of the large size of these tunnels it appeared best to divide them into two parts. With two intake and two discharge tunnels they from either tunnel. In the event of a flood with the water entering the power station basement, any one or all of the circulating pumps could pump this drainage by simply closing the sluice gates on both sides of any or all of these centre chambers.

The discharge tunnels are connected together to reduce the head loss.

The very high steam temperature involved with 320 deg. F. superheat at 325 lb. gauge at the turbines practically precludes the use of any small steam-driven auxiliaries, such as boiler feed pumps, &c. Since the water in the boilers would be evaporated to a dangerous level in a very few minutes, were the boiler feed shut off, a most reliable source of power must be provided for the supply of boiler-feed water. Power for driving the feed pumps is not considered sufficiently reliable when supplied from the main bus-bars.

In order to provide a very reliable supply of power to drive all essential station auxiliaries electrically, it is proposed to use one 2,500-KW.. auxiliary or house turbine for each pair of main turbines. Each house turbine will be provided with a low jet condenser which will normally produce about 15 inches of vacuum. The circulating water for this condenser is the condensate from the main units.

The auxiliary power and therefore the load on the house turbo-generator will not be proportional to the load on the main units; consequently, with a fluctuating quantity of circulating water the vacuum will tend to vary through a wide range. It is therefore intended that the house alternator be paralleled with the main bus so that a portion of the auxiliary load can be shifted automatically or manually from the house alternator to the main alternators to maintain a constant vacuum under all conditions. This electrical interconnection would be so made that a drop in potential or a lowering of the frequency, due to disturbances on the main system, would automatically disconnect the two and keep the auxiliaries connected to the house alternators.

In order to provide for a constant flow of water through the condenser of the house turbine, some of the water may be recirculated. In other words, if a condenser is designed for a quantity of water equivalent to ¾ load on two main units and only one main unit is in operation, the circulating pump for the house turbine condenser will recirculate half of the water. This condenser obviously serves as a feed-water heater. The tank shown just in front of the condenser (fig. 4) is a storage or surge tank for the boiler feed supply. This performs an important function, because it is impossible to feed the boilers at the same rate as the condensate is being returned from the main condensers. This surge tank therefore equalises the discrepancy and prevents overflowing of hot distilled water and the use of excessive cold, raw, or treated water.

The main condensers are of ordinary standard design, each being supplied with two circulating pumps, two hot-well pumps, and two air pumps. The hot-well pumps are each of full capacity. The others are of half the maximum capacity. It is expected that with a reasonably tight condenser system only one air pump will have to be operated at a time, and in case of very cold water one circulating pump will be sufficient. One circulating pump may give 60 per cent. to 70 per cent. of the capacity of two pumps, due to the reduction in condenser and pipe friction resulting from the reduced flow of water.

The condensers will be mounted on springs to take care of expansion and to avoid the introduction of an expensive and undesirable expansion joint between the turbine and the condenser.

All of the power supply for the less essential auxiliaries, such as cranes, coal lorries, conveyors, lighting, miscellaneous pumps, &c., will be from transformers connected to the main bus and supplied through a switchboard located in the first gallery. All the essential auxiliaries, such as condenser pumps, feed pumps, blowers, &c., will be controlled from switchboards located on the main turbine room floor at each auxiliary turbine. The operator at the switchboard will have immediate control of all the turbine-room auxiliaries within his vision and the control of the supply of power to all of the boiler-room auxiliaries supplying that particular section of the turbine room; thus, there will be four switchboard operators on the turbine room floor in addition to the main switchboard operators in the galleries.

(To be continued.)

British Canals.—The Development Department of the Sheffield Corporation is pursuing its programme of canal development, and is now making representations to the Ministry of Transport for the improvement of the canal system linking Sheffield with the Humber ports. The interest of Rotherham, Doncaster, Mexborough, and Thorne traders has been secured, and it is hoped that the necessary pressure may be placed upon the Government to secure the carrying out of the scheme. The proposal put forward is that the Sheffield and South Yorkshire Navigation shall be acquired by the Government or another public authority and that the canals which link the South Yorkshire industrial area through the Trent and Ouse with the Humber shall be widened and deepened to enable boats drawing 7 ft. of water and having a capacity of 110 tons to be used without the need of transhipment. The estimated cost of the improvement scheme is £1,750,000, and to this has to be added the purchase price for the Sheffield and South Yorkshire Navigation Co.'s Waterways.—*The Times.*

ECONOMICAL SUPPLY OF ELECTRIC POWER IN THE UNITED STATES.

A SUPER-POWER ZONE.

THE proposal that a super-power zone be created in the U.S.A. in a section of the North-East Atlantic seaboard, calls for the electrification of the railways and industries in this congested district, and for the installation of comparatively few large generating stations to economically supply the necessary electric power. This plan, and some of the engineering problems it involves, were presented at the mid-winter convention of the American I.E.E., held at New York in February last, in the form of a symposium, by ten of the leading consulting, designing, and power-plant engineers, and discussed by a number of others. The following details of the scheme are abstracted from *Power*. Mr. W. S. Murray briefly outlined the plan as providing a means by which a present estimated plant capacity of 17,000,000 H.P., divided into 10,000,000 for industrial purposes and 7,000,000 for the railroads, in a region 450 miles long, between Boston and Washington and extending inland from the coast 150 miles, now operated with a load factor not exceeding 15 per cent., could be lifted to a load factor greater than 50 per cent., and a means by which one ton of coal would do the work of two, and the railroads within the above zone and those carrying coal into that zone would be relieved of transporting one-half of the amount required for power and lighting purposes. The value of machine capacity from a utilisation standpoint would be increased from threefold to fourfold, and coal resources for the purpose named would be conserved twofold. This means that a present plant capacity of 17,000,000 H.P. can be replaced by one not greater than 5,500,000 H.P., and that not less than 30,000,000 tons of coal per annum can be saved, which at $5 per ton will represent $150,000,000 per year.

"Besides the foregoing savings, two great departments of economy will be created; one applying both to the railroads and industries, in the reduced cost of maintenance of machinery, and the other applying to the railroads alone in the reduction of train miles. It is estimated that these latter economies will effect a saving of another $150,000,000 annually, thus making a saving of $300,000,000. The foregoing are the direct savings as estimated from data collected from actual past operation o fthe specific order contemplated to be put into force in the zone under consideration.

"This plan offers immediate relief from the present intolerable congestion of our railroads by automatically increasing rail capacity without increasing track mileage, and reducing power equipment to a minimum; the present cargo space now required for industrial coal will be cut in half; train equipment in all classes will have its service practically doubled, and the present steam-power equipment, replaced by electrical equipment, can be transferred to other divisions where it is so vitally needed."

Mr. W. L. R. Emmet pointed out that "the best steam-turbine station equipment, operating under favourable conditions, can deliver a H.P.-hour in the form of electricity with an expenditure of one pound of coal, where four pounds are required to deliver a H.P.-hour to the draw bar of a good locomotive. While the comparison of efficiency between the large power station and the smaller engine or turbine equipment used in small stations and isolated plant is less striking than that with the locomotives, it is nevertheless highly unfavourable to the small plant."

Mr. J. F. Johnson expressed the opinion that "Reliability would have to be the first aim of the designer. Generating stations of some 200,000- to 300,000-KW. capacity, employing generating units of some 60,000- to 75,000-KW. capacity, each operated on steam conditions of 300-lb. pressure, 200 deg. F. superheat, and 29 in. vacuum referred to a barometer of 30 in., would involve no difficulties of design, construction, or operation, and from such stations a steam consumption rate of 10 lb. or less per KW.-hour and a total station rate of less than 1.5 lb. of good quality coal per KW.-hour output should be obtained."

Mr. H. G. Reist said: "So many generators of from 30,000 to 50,000 K.V.A. are at present in operation, giving satisfactory service, that there need be no hesitancy in considering generators as large as those now in use or larger. The potential of these generators should be within the limits of our experience; that is, not above 18,200 volts, and preferably lower, if this does not cause inconvenience in the lines leading from the generators to the step-up transformers. The losses may be expected to be less than 2 per cent. of the output of the machine. On account of the great capacity of the lines in such a large system, there may be some advantages in the use of induction generators. Roughly, the size of induction generators would probably be from 25 to 30 per cent. larger than a synchronous generator and the cost of the machine in proportion."

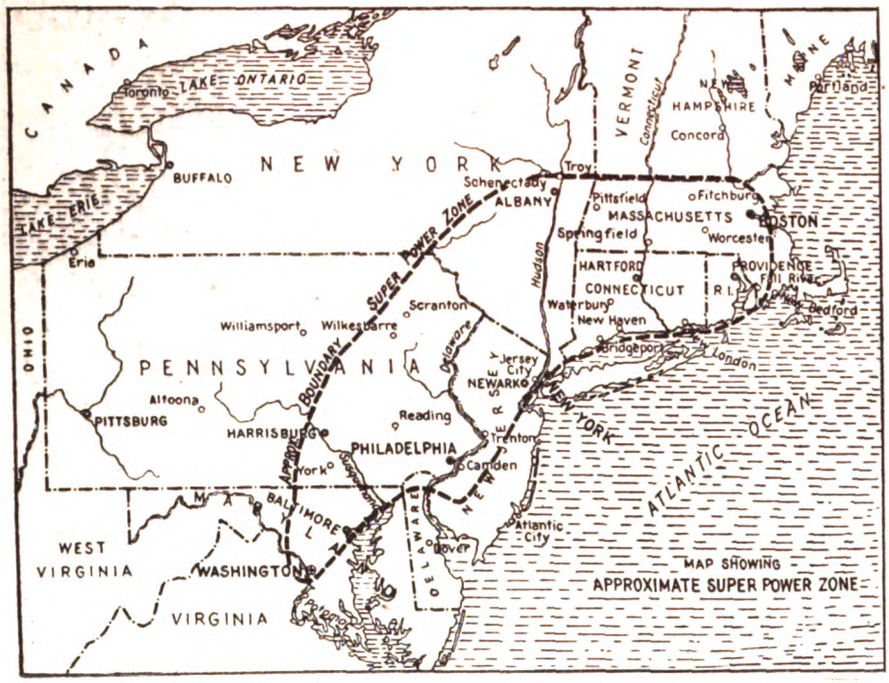
Mr. F. D. Newbury's point of view was that "the generating element in the proposed system does not involve anything new or untried. Any probable station could be designed with steam or electric generating units of a size now available. Suppose we assume a station of 300,000 to 500,000 KW. total capacity. We have available single-shaft generating units up to 40,000 KW. with generators of 50,000-K.V.A. capacity. The preferred speed for such units would be 1,200 R.P.M., 60 cycles. Eight to twelve such units would give the assumed

Digitized by Google

total station capacity. There have been developed and built triple-shaft compound units of 60,000 KW. Five to eight such units would constitute as large a station as has been suggested. All the generating units referred to are actually conservative in size, and by no means represent the largest unit of the speed in question that could be designed."

From a consideration of data available on railway operation, Mr. W. B. Potter draws the conclusions that "of the whole mileage included in the zone, a not very large proportion has been electrified. The traffic within the zone now handled by steam locomotives, if handled electrically, would require an average output of less than 750,000 KW., and if produced entirely by coal-burning electric power stations, would reduce the coal requirements for transportation purposes from 21,000,000 to 7,000,000 tons annually. As a certain proportion of electric power would be produced from hydraulic power stations, this coal requirement would be reduced in proportion as advantage is taken of hydraulic operations. The reduction in cost of maintaining the motive power units would be a large amount, which, estimated from the locomotive mileage, would be of the order of $15,000,000 or more annually.

Mr. Philip Torchio discussed the relative values of water versus steam-power development, and said: "The Western States, Mountain, and Pacific, have resources in both coal and water to meet indefinitely all the heat and power required from either source of supply, the potential water powers alone being large enough to supply over six times all the heat and power requirements in 1915. The other States, with corresponding heat and power requirements forty times greater than the Western States, have actually smaller resources in coal and potential water power, the latter capable of supplying only 8 per cent. of their total heat and



MAP SHOWING THE PROPOSED SUPER-POWER ZONE.

power requirements. It follows, then, that these States must indefinitely, as far as present human knowledge can foresee, depend upon the use of coal to supply the great bulk of these needs. These States, comparatively so deficient in water powers, consumed in 1915 528,000,000 tons of coal, about one-half for generating power and one-half for generating heat. They obtained an average efficiency from coal of 5 per cent. for the power and 50 per cent. for the heat."

In a comparison of the cost of steam power plant and hydroelectric developments, Mr. Torchio pointed out that the former cost about one-third to one-quarter that of the latter, consequently one dollar invested in steam plant would make available several times more power for industries than a dollar invested in hydroelectric plant. The author urged development of water powers especially in connection with electrochemical and metal refining processes using immense amounts of power continuously, where the net cost of hydro-electric power may be considerably less than steam power.

Mr. Percy H. Thomas assumed a transmission line extending from Lawrence, Mass., to Washington, D.C., operating at 250,000 volts, with tap lines running to the various sources of power and large centres of power consumption, and showed that it was within the scope of present engineering practice to construct and operate such a system. (See ELEC. REV., Sept. 19th, 1919, p. 371.)

Mr. J. W. Lieb called attention to the fact that an adequate power supply was one of the most important economical problems before the nation at the present time. The engineer should view the problem with a broad national outlook, and not make the mistake of the railroads by a battle over the different systems. The speaker referred to the question of both voltage and frequency making the problem involved, and illustrated this point by experience during the war, when New Jersey was short of power, and in New York City 100,000 H.P. was available, but could not be connected with New Jersey's power system on account of a difference of 2½ cycles between the two systems; this difference, however, no longer existed, since the New York Edison Co. had recently changed the frequency of its system from 62½ cycles to 60 cycles. Mr. Lieb laid great stress on the necessity of continuity of service, and said that in a community like New York City, the seriousness of interrupted service, even for a short time, would be impossible to exaggerate.

REVIEWS.

Wireless Transmission of Photographs. By MARCUS J. MARTIN. Second edition, revised and enlarged, 1919. 143 pages. London: Wireless Press, Ltd. Price 5s. net.

This book should prove of interest to two classes of readers. To the serious worker engaged in endeavouring to produce a commercially efficient method for the transmission of photographs by wireless telegraphy it gives an up-to-date account of the work which has already been done in this field, and suggests the lines along which progress might most profitably be made. On the other hand, to the amateur, who is, perhaps, not sufficiently trained in mathematics and physics to carry out quantitative experiments with wireless gear, and who finds, after he has constructed his ordinary wireless apparatus and used it for a little while, that his interest in the subject has begun to flag, it offers a new field in which his inventive talents and mechanical ingenuity can have full play, and of which he will be long in exhausting the possibilities.

The book is divided into five chapters, to which are added three appendices.

In the introductory chapter a brief account is given of the work which has already been done in the transmission of photographs over land-lines and cables, and of the difficulties which are met with due to the retarding effect of the capacity of the line. The second chapter deals with transmitting apparatus, and the third with receiving apparatus used for sending photographs by wireless telegraphy.

The problem of driving the transmitting and receiving gear in synchronism with one another is discussed in the fourth chapter, while in the fifth chapter a description is given of the "Telephograph," a system for the transmission of photographs by wireless telegraphy devised by the author. In addition, this chapter contains some useful information on the Nernst lamp, and on photographic films.

Appendix A deals with the construction and action of the selenium cell. In appendix B detailed instructions are given for the preparation of the photographs on metal plates, by which the actual transmission is controlled, and in appendix C a brief outline is given of the theory of the action of lenses as used in photography.

We notice, on page 57, when describing the receiving apparatus, in which the final reproduction of the image is brought about by means of a Bain chemical recorder, that the author expresses surprise that the point of the iron stylus used as the electrode shows signs of wear after it has been in use for some time. He remarks that "no explanation of this peculiarity on the part of the stylus can be given, as there is nothing very corrosive in the solution used, and the pressure of the stylus upon the paper is so slight as to be almost negligible." We do not think that any of our readers with a knowledge of the elementary facts of electrolysis will share in the author's wonderment at the wearing away of the stylus!

There is very little else in the book which we have to criticise. The printing is good, the descriptions of the various pieces of apparatus and the diagrams are clear, and anyone with a small workshop at his disposal should be able to make most of the apparatus required to carry out experiments in this fascinating branch of wireless telegraphy.

Graphical and Mechanical Computation. By JOSEPH LIPKA, Ph.D. London: Chapman & Hall, Ltd. Price 18s. 6d.

This book describes how to draw up alignment charts (also called nomographic charts or abaci) of all types, and should be of use to engineers and designers whose work entails the solution of equations or formulæ such as Hazen's for the

Digitized by Google

velocity of water flowing in pipes, $u = c\,\mu^{0.63}\,(h/l)^{0.54}$, where u = the velocity, μ = hydraulic mean depth, h = height, l=length, h/l=slope of pipe; c is a constant depending on the material of the pipe. To calculate u numerically, c, μ, and h/l being given, is laborious. If a nomographic chart is drawn, the values of any two quantities can be read off at once when the other quantities are given.

The author explains how various types of chart, *i.e.*, plain, Z V, &c., can be drawn. Twenty-nine detailed charts are given, such as those for giving deflection of beams, adiabatic expansion of gases, flow of water according to various formulæ, discharge of gases through an orifice, H.P. transmitted by belting, &c. Chapter I deals with scales, ordinary slide rules, log—log rules, circular slide rules, &c. Chapter II deals with log paper and solution of equations by co-ordinate paper; some of the methods of solution and types of graph are seldom used or mentioned in the English technical Press. Chapters III, IV and V deal with nomographic charts; this forms the most important portion of the book.

The well-known chart for finding the combined resistance of two or more parallel resistance paths is given on pages 41 and 104.

To assist engineers in drawing up charts, two sheets of transparent paper, one with uniform scaling and with square root scaling and one with log scaling are enclosed in the book. These types of scaling can thus easily be marked off on lines less than 25 cm. long, and charts can be quickly made. On page 107 the author explains the derivation of charts with curved lines, representing formulæ such as $Q=3.33\ (B-0.2h)\ h^{3/2}$ where Q=quantity of water, B=width of weir, h=head of water. Many examples are worked out, and many exercises are given for students to practise upon.

Chapter VI describes the deduction of empirical formulæ to represent observed data, and the determination of suitable constants either by selection of particular points, or by averages or by the method of least squares. The figures showing typical parabolas, hyperbolas, exponential curves, and $y=x\ (a+bx)$ curves, may be of use in suggesting a solution to engineers who are not familiar with the aspect of such curves, when they are trying to find the law of a curve to represent a set of physical observations.

On page 152 *ff*, the derivation of constants in equations of the form $y = a + bx + c\,e^{dx}$, and $y=a\,e^{dx} + c\,e^{dx}$, is described exhaustively.

At the end of Chapter VI are 47 examples, observed values of data from various engineering tests are quoted (along with the type of law underlying them in some cases). The student has to deduce the numerical values of the constants for himself. These exercises will be valuable for students. Chapter VII deals with the derivation of numerical coefficients of periodic curves by means of Fourier's series. References are given to other papers and books on the subject and to mechanical harmonic analysers, two of which are described in fair detail.

Chapter VIII deals with interpolation, by graphical estimation, by the use of successive differentiation and then by Newton's interpolation formula, and Lagrange's formula.

Chapter IX deals with numerical integration and differentiation, and mentions various mechanisms for performing such work. This subject is more widely known than the alignment charts dealt with in the earlier portions of the book, but should be of considerable use for reference when dealing graphically with the results of tests and observations.

It might have been convenient if in addition to footnotes, references to books had been collected in one place; the index though fairly complete, might have a few additional entries giving directly the reference to charts, viz., "water flow," or "flow of water," pages 58, 109, &c., instead of only being referred to under "Charts."—A. B. EASON.

Education and Training for the Electrical and Allied Engineering Industries. Pp. 64. 1920. London: Edwin Arnold. Price 3s. 6d. net.

This little book is the Report of the Education Committee of the British Electrical and Allied Manufacturers' Association, which was appointed during the war by the Council of the Association with directions to consider the whole subject of technical education in the electrical and allied industries, and to suggest a uniform system. The committee consisted of ten representatives of various sections of these industries, of whom the chairman was Mr. A. P. M. Fleming, C.B.E., who has for several years shepherded the apprentices of what is now the Metropolitan-Vickers Electrical Co., Ltd.

The work occupied a little less than two years, and when it is considered that nearly every manufacturing firm of importance has devoted a great deal of thought to this important question, and that many have taken action, necessarily independent, on the lines which appeared best to themselves, it will be agreed that the co-ordination of this "immense amount of unrelated work" (to use the words of the preface), and its presentation to the public in permanent form, has been accomplished in a remarkably short space of time.

The individuals who are intended to be brought within the scope of the scheme are classified into: (1) Trade apprentices; (2) engineering apprentices; (3) student apprentices; and (4) research apprentices. These are to be trained respectively to become: (1) Skilled workmen, foremen, &c.; (2) members of engineering, commercial, erecting, drafting, testing, or other staffs; (3) senior officers of the same staffs; and (4) members of the research staff.

The several classes of apprentice are to be drawn from different classes of educational establishment, ranging from the primary school to the university, and at various ages between 14 and 22 years. The research apprentices would be selected from the student apprentices, and given a post-graduate research course.

The importance of careful selection is duly emphasised, and the organisation of games, so that team-work in after life may not be unfamiliar, is recommended. It is pointed out that practical training is a vital necessity in every case.

The situation as regards scholarships is surveyed, and recommendations are made that more should be founded. This is in agreement with the policy we have for many years advocated, and we feel that if the industry in general, and the British industry in particular, is to make the strides which in the whole world's interest it ought to make, it is an essential condition that in no case shall talent be withheld or diverted by reason of the lack of pecuniary support for its development.

The committee has arrived at a somewhat strange conclusion in paragraph 65, page 43: "Hitherto the scholarship system in Great Britain has been directed almost exclusively towards encouraging students to enter the so-called learned professions —law, medicine, teaching, and the Church. Scholarships founded in recent years for the express purpose of encouraging those engaged in industry to obtain technical training have frequently merely provided recruits for the staffs of technical institutions and universities." No doubt evidence was brought before the committee which appeared to justify this view, but there are very many individuals engaged in industry who owe their technical training entirely to the facilities provided by scholarships. It is, of course, only to be expected that the older branches of learning should be more adequately provided for in this respect, but we think it highly probable that the technical engineers engaged in industry who are scholarship men outnumber considerably the whole of the technical teachers of the country. The proportion of scholarship-trained teachers is doubtless higher than the proportion of scholarship-trained engineers, but this does not prove the accuracy of the committee's conclusion, and we should like to see more of the facts—if any—on which it was based.

With the recommendations for a uniform system we are in cordial agreement, and the B.E.A.M.A. is to be congratulated on having produced a report which, if acted upon, will exercise a great influence on the future of our industry.

Principles of Radiotelegraphy. By C. M. JANSKY. London: Hill Publishing Co. Price 8s. 6d. net.

This is a well-compiled work of some 236 pages and 179 illustrations in eleven chapters. The general get up is in accordance with the usual high standard of the McGraw-Hill Co. The opening chapters deal with elementary electric and magnetic principles, tersely but quite effectively. The subject of electric waves is reached in Chapter V, and is dealt with in a way that is calculated to appeal well to students. The method of explanation of waves as pulses thrown along electric strain lines in a field of force is, however, open to some criticism, and perhaps rather dangerous to students. The strength of an electric field is, in general, proportional to the inverse cube of the distance from the charge, whilst wave intensity is only as the inverse square. Wave energy travels to distances and reaches positions from which the electric lines are completely cut off. Wave motion along the electric lines is therefore not a good explanation. Elementary alternating current theory is dealt with in Chapter VI, and the remaining chapters deal with subjects which may be properly regarded as immediately concerning radiotelegraphy. The distinguishing characteristics of different methods and systems of wireless telegraphy are fairly well treated, but expressions occur occasionally which require modification. For instance, on page 182, the energy radiated *per second* from an antenna is said to be 14.3 KW. The final chapter deals satisfactorily with the vacuum tube as a receiver and amplifier, though the author seems to be rather over imbued with the electron theory of electric currents without adequate grounds.—J.E.T.

Iron Losses in A.C. Fields.—It is not always possible to eliminate all iron parts from high-frequency apparatus. The losses in iron exposed to such fields have been examined, according to the German Physical Society, by producing the field in a coil into the field of which iron parts could be brought. The coil and iron parts were immersed in a calorimeter for the determination of the losses. It was found that placing a sheet of iron of 315 mm. diameter and 2.6 mm. thickness in front of one end of the coil 16 mm. from the end of the coil increased the effective resistance of the coil to 2.3 times its value without the iron, and the insertion of an iron tube of 3 cm. diameter and 2.6 mm. thickness into the interior of the coil increased the effective resistance seven-fold. The coating of the sheet of iron with a deposit of 0.3 mm. of copper, or 0.1 mm. of zinc eliminated the additional losses completely.—*Technical Review.*

EXPORTS AND IMPORTS OF ELECTRICAL GOODS FOR MAY, 1920.

The May returns of electrical business show considerably increased values in the export section, as compared with the previous month, and an increase of, roughly, £50,000 on the March total of £1,102,781.

The electrical exports for May reached the total value of £1,150,234, as compared with £940,014 for April, an increase of £210,220. This excellent result is largely accounted for by the increase in insulated wire exports of £147,000; telephone and telegraph cable and apparatus, £40,000; and electrical goods, £35,000; while batteries, meters, and lamp exports reached higher values than in April, machinery exports fell off in value to the extent of about £40,000.

The electrical imports for the month were valued at £193,255, as compared with £189,597 for April, decreases occurring in batteries, machinery, and telegraph and telephone imports, but in other directions increased values obtained.

The re-exports for May at £18,699 show a slight increase on the previous month's total of £15,494.

The total weight of electrical machinery exported during the month amounted to 697 tons, as compared with 1,102 tons in April, and 809 tons in May, 1919, and 2,347 tons in May, 1913.

VALUES OF ELECTRICAL EXPORTS AND IMPORTS FOR MAY, 1920.

	Exports.	Imports.	Re-exports.
Electrical goods and apparatus (unenumerated)	£162,583	£61,092	£8,507
Insulated wire	413,350	17,705	1,572
Glow lamps	20,511	6,169	308
Arc lamps and parts	2,620	1,224	230
Batteries...	48,514	3,273	22
Meters	44,170	5,048	328
Carbons	10,687	8,694	1,626
Electrical machinery :—			
Railway and tramway motors...	6,577	—	—
Other motors and generators ...	83,875	—	—
Elec. machinery (unenumerated)	54,572	61,838	2,786
Switchboards (not telegraph or telephone)	5,174	20	—
Telegraph and telephone cable and apparatus :—			
Telegraph and telephone wires and cables (not submarine)...	98,621	254	—
Submarine telegraph and telephone cables	107,527	—	—
Telegraph and telephone instruments and apparatus ...	91,453	7,938	3,320

FRENCH ELECTRICAL INDUSTRY—AMERICAN RELATIONS.

THE report of the directors of the Compagnie Française pour l'Exploitation des Procédés Thomson-Houston states that 1919 was a year of transition, and the reorganisation of the whole of the works which was proceeded with after the fusion with the Eclairage Electrique, had not taken place without some inconvenience in the activity of certain departments. During the year the company continued to clear up pre-war orders which had not been settled, and with the spirit of conciliation shown by all parties, it had been possible to bring them to a satisfactory issue in nearly all cases, without legal proceedings, and without excessive sacrifices. After referring to the capital augmentation from 120 to 200 millions of francs, the report approaches the question of exchange, particularly with the United States, in consequence of the company's purchases from the General Electric Co. It mentions that the rise in exchange might be followed by a very onerous burden on the French company for the purchases made for its own account, and much more still for its customers. Desirous, indeed, of not running any risks, the directors adopted the principle of fixing their sale prices for American material almost always in dollars. Thanks to the co-operation of their New York friends, who endeavoured to spare them this injury, and who understood that the exorbitant rise in exchange could not fail to be seriously prejudicial even to the United States by rendering exports more and more difficult, the French company had been able to carry through successfully an important credit transaction in dollars for a period of five years. It was hoped that in the course of this period the improvement in the public financial situation would permit both the company and its customers to pay off the debts under conditions which were less onerous than those existing at present.

After referring to the previously announced programme for the organisation and extension of the different works, the report stated that the work was being pushed forward as actively as possible, having regard to existing difficulties. The investigation services, centralised and reorganised, had devoted their attention to the standardisation of the constituent parts of the company's manufactures, particularly production in bulk, in order to increase the output and reduce prices. They had developed the study of large alternators up to 25,000 KW., transformers of 15,000 KW., and pressures up to 120,000 volts; high-tension apparatus, motors and apparatus specially intended for the equipment of Rumanian oil wells, and new ventilated motors for tramways. Special attention was also paid to the study of plant for the electrification of the French main railway lines, and the technical co-operation of the General Electric Co. was assured, as being infinitely precious in the case of all this special plant

and the organisation of its manufacture. Passing on from details of the various sales departments and the orders received, the directors stated that several large schemes in which they were co-operating were under examination, including the proposed installation of electric haulage on the canals of the Marne to the Rhine, extending over 217 miles. Concerning the projected electrification of various French railways and the conclusion reached to adopt the high-tension direct-current system as being the most suitable on main lines, the directors mentioned that this was the conclusion which they themselves had maintained for years past in agreement with the General Electric Co. The complete experience which the American company possessed of the construction and working of plant of this type would place the French company in a favourable position when the time arrived for the realisation of this great enterprise.

M. Charles Laurent, chairman of the company, addressing the shareholders at the recent annual meeting, referred at some length to the question of coal and coal prices and to the situation of England in this respect. If it was necessary for us to economise in the consumption of coal, he submitted that it was all the more essential for France to do so, seeing that her coal resources were extremely limited. It was necessary to substitute for coal other fuels as far as possible, as, for instance, mazout and petroleum, but the future salvation of the country lay in the utilisation of white coal—this source of inexhaustible energy which was offered by the mountains, the torrents and the rivers over a large portion of the territory, and which it was only essential to collect in order to serve the needs of industry, agriculture, transport and large centres of population. The company was particularly well situated for taking a large share in the execution of this great work.

In conclusion, the chairman paid a warm tribute to the French soldiers for having driven back the German hordes, and for now having given the same answer—*On ne passe pas*—to the new enemy which had risen before them, namely, revolution, anarchy and Bolshevism.

An Imperial University?

OUR comments on this subject, in our issue of June 11th, have brought us a letter from Mr. F. Peake Sexton, which will be found in our "Correspondence" columns to-day. The letter is charmingly inconsequential. Having demonstrated, to his own satisfaction, that the University of London does not fulfil our ideal, our correspondent invites our support for the claim of the Imperial College of Science and Technology to rank as a university. But "two blacks do not make one white"; he has not met our case in the least, for his argument, if well founded, merely shows that the University of London, like the Imperial College, ought *not* to rank as a university.

However, his argument, or rather his contention, is not well-founded. Whether our views with regard to the functions of a university are "slowly dying out" or not is a matter of opinion, which we need not discuss, but the extent to which the University of London fulfils our ideal is a question of fact, and we happen to possess exceptional opportunities of knowing the facts in this connection. Mr. Sexton himself admits that the cultural facilities for which we contend "may be found" in some of the "recognised schools" of which the Imperial College is one group; we know that it *is* found in the constituent Colleges of the University, some of which are seething with social and intellectual activity, outside the class-rooms. The handicaps under which the University labours—widely scattered colleges, lack of funds, and that worst handicap of all, its situation in a city so vast that the residential suburbs are remote from one another and from the Colleges—hinder it from attaining the efficiency in this respect that can be justly claimed by most other universities; but steps are being taken to remove such of these disadvantages as are capable of removal, and even now there is a striking contrast between the social amenities of the constituent colleges of the University and those of the Imperial College. At work, the latter is unrivalled; at "play"—the play that cultivates the best qualities of a man, or woman, as no course of study can do it—it is literally not in the running.

But it was not, and is not, our aim to champion the cause of the University, which is well able to look after itself; we asked, quite explicitly, whether the Imperial College, if granted a charter, would undertake to become a university in fact as well as in name, and we have had no answer. As Mr. Sexton says:—"Here we have a large group of colleges combined for the purpose of technical education"—and they fulfil that purpose exceedingly well. But that is all.

Incidentally, we may note that Manchester University is experiencing a difficulty of similar origin but different nature. The College of Technology, originally established by the Corporation for Technical Training, has become the Faculty of Technology in the University of Manchester; it has earned a high reputation, and there are so many candidates for the degree course that, as reported in our last issue, the Education Committee has found it necessary to limit the number in order to leave room for the local technological students who do not aim at the degree.

The incident illustrates the intensity of the modern demand for scientific training in both categories, and the only right solution, to our mind, is to provide accommodation sufficient for all comers in our educational institutions.

Price Dictatorship in Germany.

A SHORT time ago Herr Walter Rathenau, addressing the shareholders at a special meeting of the A.E.G., referred in strong terms to the enormous prices charged for raw and semi-finished materials, and remarked that they were living under the dictatorship of the heavy industries, meaning the coal and iron and steel industries. Since then various German newspapers have taken up the challenge on behalf of the heavy industries, but the best statement on the subject probably is that which has just been published giving a comparison of the A.E.G. list-prices early in 1914 and in 1920. The figures are of such interest as to be worthy of being set out prominently. They are as follows:—

A.E.G. LIST-PRICES IN 1914-1920.

	Marks.	Marks.	Percentage addition over 1914.
Normal rotary-current motor of 20 H.P.	1,100	28,362	2,478
Normal rotary-current motor of 40 H.P.	1,600	39,270	2,354
Normal rotary-current motor of 50 H.P.	1,800	44,968	2,398
Direct-current motor of 16 KW. and 1,400 revolutions	1,000	26,180	2,518
Direct-current motor of 40 KW. and 1,050 revolutions	2,000	59,290	2,865
Osram lamp of 1,000 C.P., 90 to 260 volts	8·65	245	2,733
Dynamo wire (per ?)	2 to 3	70 to 80	3,000

The percentages are given from the original statement, and have not been checked. On the other hand, the prices of coal between 1914 and the present time have been raised by 1,550 per cent., coke by 1,600 per cent., pig-iron by 3,300 per cent., and steel ingots by 3,600 per cent. Included in the price of coal are burdens which are beyond the control of the colliery owners. Thus, there are the 20 per cent. *ad valorem* tax imposed upon the production of coal, the tax on the turnover, the tax of 6 marks per ton to defray part of the cost of providing miners' dwellings, and the additional expenditure for the payment of special overtime rates to the miners. All these causes re-act upon the prices of iron and steel, apart from the fabulous prices which have to be paid for Swedish and other foreign ores. Moreover, the prices of coal and iron and steel are under the public control of the Federal Coal Board and the Federation of the Steel Industry, which have been created by the Government, and which include representatives of both consumers and workmen. Such control, however, does not exist in the electrical industry, and so long as this kind of regulation is absent it is considered that Herr Rathenau has the least justification of all to speak of dictatorship in the heavy industries.

THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION.

The Annual Convention at Ilkley.

THE Convention of the I.M.E.A. this year opened under the most favourable conditions that could be wished for. The headquarters, at Ilkley, were situated in one of Britain's most famous beauty-spots in Wharfedale, the heart of the Yorkshire moors, a district which afforded an abundant choice of enjoyable excursions for those on pleasure bent, while its midland situation rendered it comparatively easy of access from all parts. Regarding the site from an industrial point of view, it is interesting to note that Bradford, which as the President's "home town," was the determining factor in the choice of venue, was one of the first English municipalities to embark on the business of electricity supply; the original power station at Bolton Road, which commenced public supply in 1889, was, in fact, the first of its kind to employ direct-coupled engines and dynamos, and it is amusing, in the light of modern developments, to record that the plant comprised three sets of 81 KW. and two of 125-KW. output, all, of course, being bipolar machines. Since those early days two other stations have been erected at Valley Road, in 1897 and 1902 respectively; the former was but a modest step in advance of its prototype, the largest set being of 375-KW. output, but the third station contained sets of 1,000 KW. each, and was typical of the final stage of development of the direct-current power station. Much of the D.C. plant is still in use at Valley Road, but the rapid increase in the demand for power in Bradford, led to the inevitable change of system to three-phase generation. Mr. T. Roles came into office as chief electrical engineer and manager in 1912, and under his control the undertaking has been developed on up-to-date lines, the plant now including turbo-alternators of some 30,000-KW. capacity, of which the largest set is rated at 15,000 KW.—with another of the same size on order. The station forms an epitome of the progress of steam generating plant, examples of bipolar high-speed and multipolar low-speed D.C. generators, and both vertical and horizontal, Curtis and Parsons, turbo-alternators being at work together.

The Convention, which commenced with an informal reception and social evening at the Winter Garden, Ilkley, on Monday, was formally inaugurated on Tuesday morning at the Queen's Hall, "The Windsor," Bradford, when the Lord Mayor, Alderman Wm. Wade, J.P., extended a hearty welcome to the Association. He said that Bradford claimed to be the first local authority to use powers to supply electricity, in 1889. Mr. Roles returned thanks and then delivered his address, of which an abstract follows.

The leading feature of the address was his commentary on the recent and pending legislation with regard to electricity supply. Incidentally, Mr. Roles referred to the removal of the obstacle which has hitherto restricted the attendance of representatives of local authorities at the Convention, a concession which was certainly long overdue, and which should not only prove helpful to the Association, but should also facilitate attendance at various other gatherings in the public interest. Mr. Roles endorsed the complaint of members of the Association that the powers to carry on the hire-purchase system and to sell apparatus outright, for which they have long yearned, had not been granted by the Act, and expressed the hope that these additional powers might ultimately be secured by agreement with the Electrical Contractors' Association. His natural optimism is here revealed; we hope it will be justified by the event, but at the moment the prospects of the attainment of that desirable consummation seem remote.

Turning to the major theme, Mr. Roles plumps for the compulsory and financial clauses of the new Electricity Bill, although he complains that municipal authorities in general are singularly indifferent to the matter, and some are openly hostile to the Bill. He admits that the terms of purchase might with advantage be amended, a view with which we cordially agree, and which, we think, will find few objectors; but he is not disposed to allow the compulsory powers of purchase to be dropped, or even delayed. His contention that such powers are indispensable, in order to coerce recalcitrant authorities, "either municipal or private," as he says, is one that we ourselves advanced when the Bill of 1919 was before Parliament; we are, however, inclined to sympathise with those who hold that the existing Act should be given a trial before any further legislation on these lines is enacted. The Commissioners have their hands full already with schemes in active progress; a considerable time is likely to elapse before they feel the need of compulsory powers of purchase, and in that time valuable experience will be gained on which to base legislation. Purchase by agreement is already authorised under the Act of 1919, and is free from the objections justly raised to the terms of purchase that were foisted upon the companies in the original Bill. Apart from the question of purchase, voluntary co-operation in the establishment of Joint Electricity Supply Authorities is producing valuable results, and is very much to be preferred to compulsion. It may be that considerations such as these are at the root of that municipal indifference to the new Bill which Mr. Roles deplores.

The financial clauses, however, stand on a different footing. Finance is the stumbling-block in the path of the progress of the embryo Joint Authorities, which, unlike the individual municipalities, have not the rates at their backs. No such authority can mortgage the rates of any of its constituents, some of which, moreover, will be private undertakings. Nor can it even pledge the plant and mains of the undertakings which it controls. It will be impossible for Joint Authorities to raise the necessary capital for any developments outside the constituent undertakings, under the existing conditions. We are of the same mind as Mr. Roles that Government ownership and control of power stations and mains would be in the last degree unwelcome and contrary to the public interest, but that the provision of funds for the purposes of the Joint Electricity Authorities is a vital necessity, and, as he says, the financial clauses are the most important part of the amending Bill.

It is interesting to learn from the address that the Association is likely to appoint a salaried secretary and to secure suitable office accommodation. We were pleased to see that Mr. Roles commended the E.D.A. to the attention of the members; seeing that the great majority of electricity supply undertakings in this country are in municipal hands, and that the operations of the E.D.A. are directed towards the increased utilisation of electricity, it is obvious that the I.M.E.A. is in duty bound to give its whole-hearted support to the Electrical Development Association.

A vote of thanks to Mr. Roles was moved by Councillor Barge, of West Ham, who eulogised the work of the President for the Association, especially during the past year. Mr. Gillin read his paper in abstract, after which Mr. Roles presented the author with a Premium in the form of a stop-watch. A lively discussion followed, in which Messrs. Wordingham, Staniland, Ayton, Bell, Fedden, Purse, Watson, Brooking, Webber, and Ferranti participated. Later the Association was entertained to luncheon by the Bradford Electricity Committee. Councillor Wilfrid Turner, the chairman, presided. Alderman Sinclair, Mayor of Swansea, proposed the toast, "The City of Bradford," and the Lord Mayor responded. Mr. Chattock, formerly city electrical engineer there, proposed the health of the chairman, who duly responded. The delegates proceeded by char-à-bancs to the Phœnix Works of the English Electric Co., where they were entertained to tea. Mr. Roles expressed the members' thanks, and Mr. Pybus, joint-managing director, acknowledged. The Corporation electricity works were then visited. After returning to Ilkley there was a reception by Councillor Dixon, chairman of the Urban Council, at the Winter Gardens. In this very enjoyable function singing, dancing, and light refreshments each had a place.

Up to the time of writing, the weather has been fine, and the Convention has proceeded successfully in every way.

Presidential Address.

By THOMAS ROLES (City Electrical Engineer and Manager, Bradford). (*Abstract.*)

As far as the electricity supply industry is concerned, the past year must for ever remain memorable, as during its course the Electricity (Supply) Bill received the attention of both Houses of Parliament, and the Electricity (Supply) Act, 1919, which resulted, came into operation. This Act has been well referred to as "the great charter of electricity," and it cannot fail to have far-reaching effects on electricity supply in the British Isles.

Many of the provisions of the Act give powers which the Association has itself for years laboured to secure, and a number of such powers have been obtained directly as the outcome of the efforts of the Association's Council. Representatives of a number of local authorities are for the first time attending the Convention without fear of their reasonable expenses being questioned by a Government auditor. The removal of the disability which previously existed as regards subscribing to associations has been of distinct advantage to the Association, in that its membership has increased during the year as a result, and under the circumstances now existing it is to be hoped that no municipal electricity supply undertaking will fail to avail itself of the advantages which membership of the Association affords.

As regards the section of the Act which authorises the supply of apparatus on hire, considerable disappointment has been expressed by many members of this Association that the powers given are restricted to the hiring of such apparatus, as it is considered that powers to provide apparatus on the hire-purchase system and to sell outright are very necessary in the interests of municipal undertakings. Personally, I have every sympathy with these views, and consider that such powers, if given, could be utilised for the benefit of consumers of electricity, electricity supply undertakings, electrical manufacturers, and electrical contractors; and I sincerely hope that in the course of time the relations between the Electrical Contractors' Association (Incorporated) and this Association may become such that some agreement may be reached under which a successful attempt may be made by municipal electricity supply undertakings to secure powers for hire-purchase and sale, to be utilised under certain agreed conditions which may be recognised by the electrical contractors as reasonable and just, and as being likely to advance rather than in any way to militate against their interests.

It is a matter for regret that the Government found it necessary, in order to save those portions with which more or less general agreement had been expressed by the whole of the electrical industry, to withdraw certain clauses from the original Bill. This regret, I am aware, is not shared by a large number of those who are connected with the industry, who are of the opinion that the Act as it now stands is sufficiently comprehensive for all practical purposes, and that its provisions should be given a trial prior to any further legislation on electricity supply matters being promoted. The Government, however, and it must be remembered that the Government has now the advantage of the advice of the Electricity Commission, appears to be of the opinion that it is desirable that the whole of the powers sought under the original Bill should be obtained. The clauses in the new Bill may be divided into two groups, those in the first of which have for their object the setting-up of District Electricity Boards and the compulsory acquisition of generating stations and main transmission lines belonging to existing electricity supply undertakings; the clauses in the second group, usually referred to as "the financial clauses," have for their object the empowering of the Joint Electricity Authorities which are to be constituted under the existing Act, as well as the District Electricity Boards contemplated under the Bill, to borrow moneys, and to authorise the issue of stock. They will also allow authorised undertakers to give financial assistance to Joint Electricity Authorities and District Electricity Boards, and the Electricity Commissioners, under certain circumstances, to lend money to such authorities and boards.

From the point of view of the electricity supply industry the financial clauses may be said to be the most important, as it has become clear to all who have been considering the setting-up of Joint Electricity Authorities that the financing of such authorities is impracticable until some such provisions as are contained in the clauses in question are made.

With regard to that part of the Bill which concerns the setting-up of District Electricity Boards and the compulsory acquisition of generating stations and main transmission lines, it appears to me that, although in many cases such powers may not prove necessary, yet it is essential that the Commissioners should be provided with them, as otherwise it is difficult to see how the Commissioners are to enforce the carrying-out of a desirable scheme in face of unreasonable opposition which may be experienced from one or more electricity undertakings in the district to which such scheme is to apply. As things are at present, it would appear that one unreasonable electricity supply authority might hold up for a considerable time, or even permanently, a scheme which would be to the benefit of the consumers of electricity in a very large area. In view of the general satisfaction which has been expressed throughout the country with the appointments which have been made to the Electricity Commission, I consider there is no reason why the Commissioners should not be furnished with the powers necessary to enable them to enforce the carrying-out of proposals which they deem to be in the public interest. It is possible that the terms of compulsory purchase, as set forth in the Bill, may, with advantage, be to some extent amended, but I think it will be generally conceded that provision should be made under which generating stations and main transmission lines may, under certain circumstances, be compulsorily acquired.

As a private citizen having some knowledge of the subject I hold that the provision of an adequate supply of electricity at the cheapest possible price is an absolute necessity to the welfare of this country and its inhabitants, and I should not be prepared to allow any interest, either municipal or private, to stand in the way of such an adequate and cheap supply being furnished. As President of this Association and chief officer of a municipal electricity supply undertaking, it is my duty to ensure as far as possible that municipal interests are conserved and furthered.

In the light of these remarks, I feel that on general principles the Bill before Parliament should command the support of local authorities. Of the two noble lords who first opposed last year's Bill on its being introduced into the Upper House, one is a director of certain electricity supply companies, and the other was very recently the President of the British Commercial Gas Association. Having in view the sources from which opposition to the measure emanated, I think local authorities would not be wrong in coming to the conclusion that last year's Bill, including the clauses which were deleted, was one which on the whole might be regarded as in no way inimical to their interests. If such conclusion is come to, it follows that municipalities should look with favour on the Bill at present before Parliament, but up to the present there seem to be few signs that this Bill is receiving any great amount of support from local authorities. I would suggest it is high time that municipalities and the Associations representing them came to some decision with regard to this matter, and defined a policy which their representatives and officials may pursue on their behalf.

It has been put forward as an objection to the formation of Joint Electricity Authorities and District Electricity Boards that, in view of the heavy financial liabilities which municipalities are having to incur in connection with housing and other matters, they cannot be expected to incur further responsibilities of this nature by financing electricity supply schemes. It is, I think, advisable to consider the probable result should this attitude be generally taken up. The very great demand for electricity which is now being made must be met, and the Government has apparently rightly determined that it shall be met. If the principle of public control is to be given effect to, this must be done either by schemes financed by the Government or by municipal bodies individually or in association. It appears quite clear that under present circumstances the Government is not in a position to finance such schemes, and were it able to do so I think it is generally felt that Government control of the generation and main transmission of electricity would not be in the interests of the community. If the Government will not or cannot supply electricity under a national scheme, and municipalities object to carry out the work by reason of the financial risks involved, the only alternative of the Government will be to hand over the task of the development of electricity supply to private enterprise.

Personally, I cannot bring myself to believe that grounds for serious apprehension with regard to the financial position exist. The Engineering Commissioners are gentlemen fully acquainted with the principles underlying the giving of supplies of electricity under conditions which are likely to prove satisfactory from a financial point of view, and one cannot conceive that they would urge any authority to embark on any rash scheme, or sanction the carrying-out of an unsound scheme put forward by any such authority. Moreover, one of the Commissioners has been specially appointed to give attention to financial matters in relation to electricity supply, and, therefore, one may expect him to place his veto on any scheme the financial aspects of which may appear to him unsatisfactory.

To my mind the principle underlying the legislation which has been enacted and which is proposed is as follows:—

A great demand for supplies of electricity is being made throughout the country, and this demand will be an increasing one. The supplies can be given by existing authorities acting for the most part individually as they are doing at present. If, however, such authorities will co-operate or amalgamate in order that electricity may be generated on a larger and more efficient scale, cheaper and more reliable supplies should be available than if individual generation is continued.

The situation would probably be best dealt with in the following manner:—

Immediate demands for electricity must in the national interest be met, and this will for the time being entail the extension of many existing generating stations, whether good, bad, or indifferent. Generating stations in reasonably close proximity to each other should be linked up by main transmission cables, and on this being accomplished the most efficient stations of those so linked would naturally, for economic reasons, be called upon to meet the greater part of the demand, the least efficient stations being operated for as short periods as possible. As far as practicable extensions should only be allowed in connection with the most efficient

Digitized by Google

stations. Where and when the demand renders it necessary, a capital station should be erected and equipped for the provision of the supply required in the district, instead of several smaller generating stations being erected, each of which would supply the needs of one particular distributing area only. On the capital station being put into commission it should, owing to its efficiency, be run at a high load factor. The most efficient of the previously existing generating stations would be run at moderate load factors, and the smaller and less efficient stations would only be utilised at peak load periods or otherwise would be entirely dispensed with. On these lines an efficient system of generating electricity would be gradually evolved, which should tend to cheap production and reliability of supply, and at the same time the capital already sunk in the industry would for the most part continue to be utilised to full advantage.

As far as one is able to judge from decisions which the Electricity Commissioners have from time to time been reported to have made, it is on these lines they are proceeding.

It is somewhat remarkable that power companies seem to be expressing no fear of taking the financial risks involved in supplying electricity over large areas; on the other hand, they appear eager to accept such risks, and I have little doubt in many cases would be prepared to relieve municipalities of the financial responsibility regarding which some are so apprehensive.

I would, therefore, repeat that it is for municipal authorities to decide upon the line of action they intend to pursue, both with regard to the new Bill and the formation of Joint Electricity Authorities, and that their decisions should be come to without delay, as, if public control of the supply of electricity is desired, there is unlikely to be a better time than now for obtaining it.

The Design of Distributing Networks.

BY C. A. GILLIN, A.M.I.E.E. (Bradford Electricity Department). (*Abstract.*)

PRACTICALLY all generating stations (in the United Kingdom) have been at one period of their evolution the sole distributing centres in their areas of supply. In the larger areas they have been superseded by larger generating stations and by virtue of their positions they have automatically become distributing centres for their respective districts.

The objects to be aimed at in designing distributing networks are: (1) Economical service and distribution; (2) continuity of supply; (3) satisfactory operation; (4) minimum expenditure on repairs.

I (*a*). E.H.T. DISTRIBUTION.

In figs. 1 and 2 the four squares A, B, C, D represent diagrammatically four districts in a supply area having a reasonably uniform density of load, the centre of each being at the points ×, and to represent scattered districts one merely thinks of the squares as being separated by as many miles as their boundaries are apart.

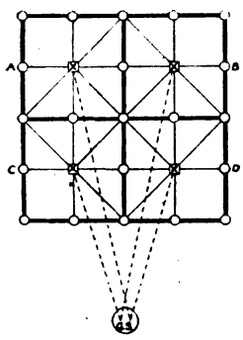

FIG. 1.

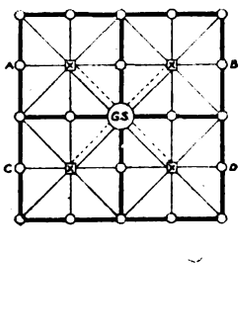

FIG. 2.

cubicles in each chamber; total permissible pressure drop on cables 7½ per cent.

If the situation of a generating station is such as to allow of its later use both as a station for the economical generation of large supplies of energy and as a distributing centre for its immediate district, the voltage for the latter purpose should be from 6,000 to 10,000; but for even comparatively short distances the most economical voltage for the transmission of reasonably heavy loads from the generating station to distributing centres in other districts will be 30,000 volts or more. The curves shown in fig. 4 illustrate this fact. The figures upon which the curves are based are as follows:—

The total permissible pressure drop (including transformers) is within 10 per cent.; all transmission losses have been neglected, the figures being only capital outlay; step-up and step-down transformers are included in the 30,000-volt curves, but no transformers are necessary in the case of 6,000 volts; only 6,000-volt switchgear has been provided for, it being assumed that transformers and cables will be treated as one complete unit for each 30,000-volt line; one spare cable and the necessary transformers have been allowed for in each instance considered. In all curves and data in this paper present-day prices form the basis, with copper at £125 per ton, lead £40 per ton; cables unarmoured, taped, laid direct under average roadway conditions.

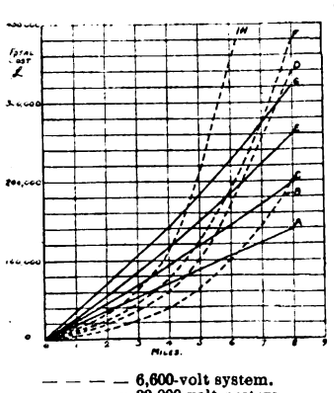
If the correctness of the above principles be conceded, the logical deduction is that a supply area would ultimately resolve itself into a number of districts whose boundaries should be a maximum distance of approximately 5 to 8 miles from their respective distribution centres; the latter (unless themselves generating stations) receiving the requisite supplies from a generating station and transforming down to a pressure of from 6,000 to 10,000 volts for district distribution.

This splitting-up of a supply area into constituent districts will be a natural process consequent upon the size of the existing cables connecting the districts to the sources of supply having become inadequate to cope with the increased demands.

The distributing centres will not necessarily be near the centres of their respective districts, as their positions will be determined by power demands in unexpected directions and their strategic value for directional distribution.

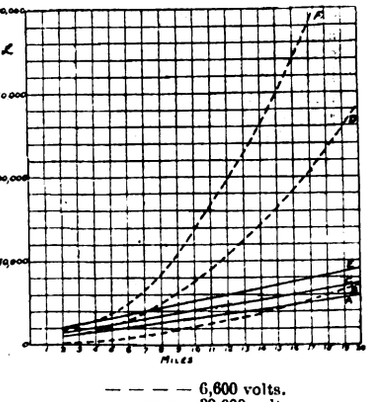
The lay-out of the E.H.T. distributing network is intimately bound up with the question of the section of the cables, the system of electrical protection from the effects of faults, the satisfactory isolation of the faulty apparatus, and the maintenance of the continuity of supply despite breakdowns. The early provision of an adequate number of telephone lines for point to point communication is a factor of importance.

All feeders as soon as possible after leaving the source of supply should be laid along different routes. After a few years they become a united fmaily again and the network is thus created. All future extensions must be made with one eye on finance, the other on potential consumers, and the mind on prospective distributing centres. Unfortunately, good finance often means bad engineering (in distribution schemes), but this could and should be altered by judiciously



6,600-volt system.
33,000-volt system.
Transformer chambers per mile, curves A and B, 4; C and D, 6; E and F, 8; G and H, 10.

FIG. 3.—TOTAL COST OF DISTRIBUTION AT 6,600 AND 33,000 VOLTS.



6,600 volts.
33,000 volts.
Power transmitted, curves A and B, 1,000 K.V.A. C and D, 5,000 K.V.A.; E and F, 10,000 K.V.A.

FIG. 4.—COST OF TRANSMISSION AT 6,600 AND 33,000 VOLTS.

Taking into account the cost of switchgear, number of transformer chambers per mile and their average K.V.A. demand, the most economical distribution pressure from 1 mile up to about 5 miles radius is 6,000 volts and up to about 8 miles radius is 10,000 volts. In order to show how the high cost of switchgear for use at higher pressures overbalances the reduction in cost of cables, the curves shown in fig. 3 have been prepared.

Comparison has been made between 6,000 volts and 30,000 volts distribution, because the majority of stations are already using the former, although 10,000 volts would have shown results more favourable to the lower pressure at a greater radius of distribution than is shown with 6,000 volts. The higher values of the curves are of no particular importance, as the radius of distribution of a main distributing centre would seldom exceed 4 miles. The curves are based on the following data: No duplicate cables; all cables split-conductor type; transformers and buildings not included; average capacity of transformer chambers 250 K.V.A.; three switchgear

increasing the tariffs for electrical energy. Supply undertakings are inclined to be too philanthropic, except to their employés.

When the early outgoing feeders are visibly approaching the limits of their carrying capacities is the time to spend a lot of money wisely for future requirements. And here lies the advantage of building up a considerable reserve fund instead of allocating a mythical "surplus" towards the reduction of rates. This is the time to establish distributing centres and give some of them, via new transmission lines at 30,000 volts or more, a "cheap and abundant supply," at the same time linking-up or cross-connecting to other districts until it becomes necessary for these in their turn to be augmented by similar means. Thus we reach the scheme shown diagrammatically in figs. 1 and 2, where the squares A, B, C, D represent districts each of about 16 square miles area, × represents the distributing centres, G S the generating station, and all intersections or junctions of lines sub-stations, transformer chambers, or switching chambers.

Digitized by Google

In the early days practically all cables laid were too small, chiefly perhaps because of difficulties with regard to capital expenditure; the practice should not be repeated. All cable sizes should be decided more by the dictates of experience than as the result of calculation. The only limits to the sizes of cables between generating stations and distributing centres should be those due to difficulties in handling, desirability of duplication, limitation of reliability of switchgear operation under extraordinary loads, and financial checkmates.

The sectional area of network cables will depend upon their position relative to the other portions of the network, and on the loads they may be called upon to carry in the event of faults on neighbouring or co-related cables. It is generally uneconomical to load up cables to their safe carrying capacity. The curves in figs. 5 and 7 give an interesting illustration of the extent to which cables may be safely loaded. The results shown should be used discreetly for A.C. pressures higher than 400 volts, as L.T. A.C. currents were used in determining the curve values, and allowance must be made for heating due to energy loss in the dielectric. The curves in fig. 5 shows the temperature rise due to a steady current of uniform value, and those in fig. 7 have been obtained by increasing the current in any particular cable in successive stages after the

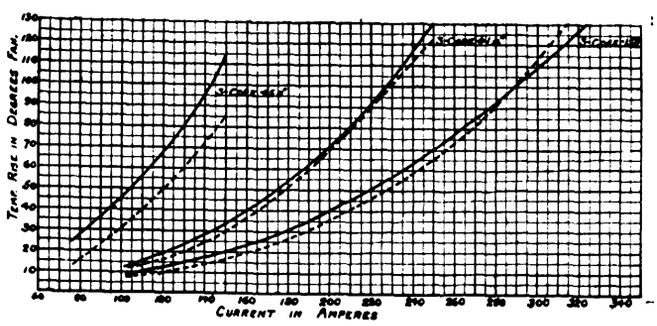


Fig. 5.

temperature due to the current value in the immediately preceding stage had ceased to increase. Each of the latter readings involved a run of several hours before the temperature became steady, and the tests occupied three weeks. There was only one three-core cable used in each test, so that the results require adjustment where two or more loaded cables are laid near each other.

The system of protection should be the first point to be tackled, instead of—as it often is—the last. Effectual protection is one of the most important items in the whole undertaking.

The Merz-Price, the split-conductor, and the Hunter-Beard compensated pilot appear to be the only well-tried systems of protection which fulfil the conditions; and of these the split-conductor seems to be the best for our purpose up to about 20,000 volts. Beyond this voltage the compensated pilot has the advantage if it turns out as good as it seems. Are the extra advantages worth the extra cost? A duplicate radial system of mains, with tees off wherever necessary, judiciously interlinked at points provided with reverse power relays and equipped wherever necessary with time-limit overload pro-

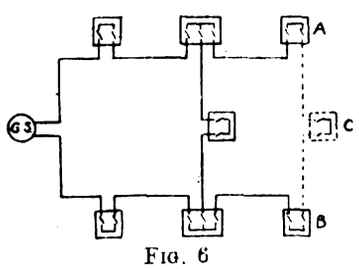

Fig. 6

tection, with, generally, the transformer chambers and sub-stations divided between the two feeders, has been and still remains a popular arrangement. Its disadvantages are small having regard to the infrequency of E.H.T. faults, and in practice lie in the fact that perhaps once in five or six years half the consumers connected to a feeder have their supply cut off for an hour or so until they can be changed over to the duplicate feeder. Until a very few years ago our experience was that most of the supply interruptions were due to faulty protective apparatus, particularly in the case of reverse power relays, but these drawbacks no longer apply if discretion in the choice of suitable instruments be employed.

The greatest asset in the claim to superiority of the balanced-current or split-conductor system of protection is the fact of the non-interference of cable faults with the continuity of supply. This fact, of course, presupposes the completion of all the interconnections necessary to ensure a supply being available from another cable at all sub-stations and transformer chambers. The reliability of modern cables, however, is so great that one is quite justified in taking, and is, indeed generally economically compelled to take, the small risks of temporarily supplying via only one cable with a view to interlinking later when the opportunity presents itself. The position is illustrated diagrammatically in fig. 6 at A and B with C as a prospective means of completing the cycle.

In order to compare the costs of complete networks constructed to operate under these two systems, *i.e.*, the duplicate-radial system and the split-conductor system, a typical district approximately 16 square miles in area, commencing at a line one mile from the centre of a city and extending outward has been examined. Definite positions for transformer chambers at distances averaging ½ mile apart and 6,000 volts distribution have been assumed. Account was only taken of excavation, reinstatement, cables, their mechanical protection and jointing, feeder switchgear, and protective apparatus in transformer chambers. Buildings and the remaining transformer-chamber equipments have been left out. As a fair comparison two 3-core 0.05 cables, unarmoured, taped and with copper earth sheath in the one case, and one 3-core 0.1 sq. in. split-conductor cable, unarmoured, taped and without copper earth sheath in the other case, were taken. The resulting costs approximated so closely in the two cases that financial considerations do not at all enter into the discussion.

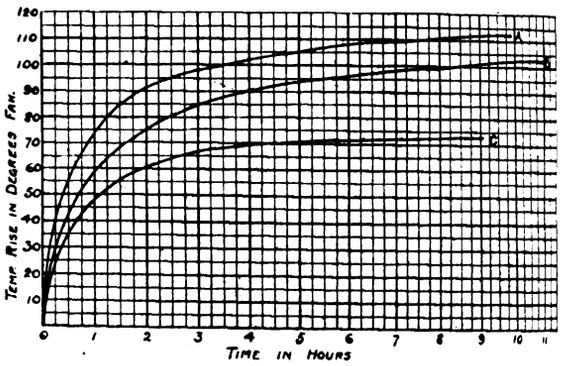

Fig. 7.

as to which system is the better to adopt. In fact, by changing about the assumed positions of transformer chambers either system can be shown to be slightly cheaper than the other.

I (*b*). Medium-Pressure A.C. and D.C. Distribution.

Medium-pressure supply areas are now always divided up into districts, which may be called feeder areas, a feeding point or transformer chamber answering the same purpose and performing the same functions in a minor degree as the distributing centres referred to in section 1 (*a*). Each district is connected with its neighbouring districts through a number of fuse pillars. Most municipal supply areas have a good deal of productive capital sunk in D.C. networks of fair heavy density within a reasonable distance of the original generating station. As the demand for energy increases, and more economical and larger units of plant become practicable, generation is of necessity by turbo-alternators, which replace gradually the smaller machines. The tendency will be to narrow down the D.C. areas by the encroachment upon their boundaries of the A.C. mains. It will not only be found a sound commercial proposition to encourage this A.C. advance by a reasonable lopping-off and changing-over to A.C. of the extended arms in the D.C. areas, but these prospective alterations should be anticipated by putting down suitable distributing mains and arranging the local balancing in advance whenever extensions are made where this seems appropriate. The subsequent change-over to the A.C. system then becomes both inexpensive and comparatively simple.

D.C. feeders should not be of large size except where necessary to compensate for voltage drop, because (1) the supply to an area having its feeder out of commission has to be maintained by the distributors of its own and its adjoining areas in addition to their own load; (2) disturbance is more circumscribed in the event of feeder troubles; (3) the distribution voltage is more uniform. For these reasons also the radius of a feeder should be extended or reduced according to the density of its load, and any later adjustments rendered necessary to cope with increased loads may be met by putting down another feeder and creating an additional feeder area. These remarks apply equally to the capacities of sub-stations, transformer chambers, and transformer pits in the case of the A.C. areas.

In the matter of individual feeder areas, the following observations are applicable both to D.C. and A.C. systems of supply.

Every proposed extension must be carefully considered as to its bearing on all other parts of its own and adjoining feeder areas. Arterial cables leaving a feeding point must have ample provision not only for carrying their own local loads, but also for any supplementary loads they may have imposed upon them in consequence of the failure of another arterial cable or a feeder supplying an adjacent area. The number of cables radiating from a feeder point should be as large as possible, and each of them should feed a small section of

Digitized by Google

an area, the said section being controlled by a heavy fuse at the feeding point and connected to adjoining sections of the same area and to neighbouring areas through sectional fuse pillars in which the fuses are carefully graded to suit their local obligations. Between these points network disconnecting boxes, switch pillars, and other fuse pillars should be inserted at strategical intervals. Intelligently followed out, these provisions will restrict to a minimum the inconveniences due to faults, facilitate the quick restoration of healthy circuits, and allow of comparatively rapid location of "earths" and other troubles.

It would be a good plan to provide a sum annually out of revenue to be used for the sole purpose of converting into a decent engineering job those cases where capital expenditure is curtailed in order to make an extension to a prospective consumer a paying proposition. The use of a provision of this sort should be exercised with careful discretion, but it would certainly be of great advantage to be able to propose a scheme for approval at a specified cost, with an addition from such a fund for engineering purposes.

A limited range of cable sizes should be definitely standardised for all the above purposes. For feeders two sizes, viz., 0.5 sq. in. and 1.0 sq. in. sectional area, with a smaller neutral for D.C. districts, should be sufficient, keeping in mind the desirability of increasing the number of feeders rather than their carrying capacity. Pilot cables are sometimes not very satisfactory when laid up under the same sheath as the feeder cables, but several instances have occurred where they have saved very inconvenient interruptions to district supplies by indicating incipient faults before these have affected the cores of the feeder. For this reason, amongst others, pilot wires should always be protected by a light fuse at the feeding point as well as at the station.

For distributors, sizes varying from about 0.3 sq. in. to 0.05 sq. in. sectional area in four stages should be adopted, the existence of the smaller sizes being forgotten wherever possible. A smaller neutral would, of course, be used on D.C. networks but not on A.C. networks, as it must be remembered that an out-of-balance on the two systems has not always the same effect in the neutral cable. The same sizes, with the range extended to a minimum of 0.022 sq. in., would also be used for services. It seems hardly worth while considering a smaller size than 0.022 sq. in. nowadays when the size of the house is no longer an indication of the affluence of the resident.

(To be concluded.)

THE KEEPING OF BATTERY RECORDS.

ACCUMULATORS, although necessarily only a minor part of most generating stations, are nevertheless very important articles, and unless accurate records are kept of them it is very unlikely that the best possible results will be obtained from them. The study of accumulator behaviour is almost a science in itself, and one which a large number of engineers are inclined to treat somewhat lightly. Of the value of complete records of the behaviour of accumulator batteries there can be no doubt; indeed, practically all the leading battery manufacturers who guarantee their goods demand that full records be sent to them regularly in order that they may watch very carefully the life of the cells themselves, and in many cases they are able, by this method, to prevent serious damage to the battery.

When keeping records of accumulators it is well to remember two things: one, the record should show at a glance everything of importance, and two, everything that is not of importance should be left out, as it only occupies valuable space and helps to confuse the issue. We can now ask ourselves what records are necessary in order that the engineer may see clearly what is taking place in the battery. A suggested form of log sheet is shown in fig. 1; readings should be entered on this every half-hour. From it we can see at a glance the exact condition of the battery. We can see whether it is charging or discharging, its capacity in ampere hours, and the rate of charge or discharge. As it is impracticable to test each cell in the battery every half-hour, we can select one cell as the "pilot cell," and its condition as indicative of the condition of the remaining cells. The voltage, specific gravity, and temperature of this cell are noted every half-hour, and from these readings we can get a very accurate conception of the condition of the battery. In very large batteries two, or even more, cells may be used as pilot cells.

In addition to the pilot cell readings, however, a careful examination of the battery should be made every night at a specified time (preferably when the load on the station is at a minimum). These readings should be entered in the "Individual Cell Readings," columns, and upon the voltage or specific gravity of any cell varying from the average, a careful investigation of its condition can be made. A record of all work done on the battery should be noted in the remarks column. Special log sheets could be printed for the battery only, but the better way is to embody it in the station log sheet.

FIG. 1.—SUGGESTED FORM OF BATTERY LOG SHEET.

LEGAL.

STOBIE *v.* NEWCASTLE-ON-TYNE ELECTRIC SUPPLY CO.

(Continued from p. 778.)

MR. NORMAN WEST, electrical engineer on the staff of the Supply Co., said that he first met Mr. Stobie when he got in touch with the Supply Co. with a view to that company financing him. That was in 1911, at which time he (Mr. Stobie) had a small works at Sheffield. He (witness) was directly connected with the construction of the Stobie Steel Works at Dunston, which were lent by the Supply Co. In 1915 he became secretary of the Stobie Steel Co., the business of which, at that time, was going very badly, and a supplemental agreement was entered into to get over the difficulty. A control committee of the Stobie Steel Co. was appointed, and witness was a member of that committee from that time until July 31st, 1917. He was at the Stobie Steel Works practically seven days a week, being in charge when Mr. Stobie was away. Mr. Stobie had no separate office in Newcastle, but used to work in a room in his private house. Between 1913 and the early part of 1917 he never heard that Mr. Stobie was carrying on any separate business in the nature of a construction business, and so far as he knew he had no building where he could do any construction. In 1917 the plant of the Bradley Williams works at Dunston was sold by auction. Witness attended the sale with Mr. Stobie and bought for the Stobie Steel Co. a store and 114 yards of main line sidings. That was bought for removal to the steel works. At that time there had been no suggestion of the purchase of the site of the Bradley Williams works. Shortly afterwards, however, Mr. Stobie reported to the committee that he had had an offer from the liquidators of the Bradley Williams Co. to sell the site for £2,000, and gave a glowing account of the possibilities if it were purchased. Mr. Sloan, the managing director of the Supply Co., and a member of the Stobie Control Committee, was against the proposal at first, but in the end he was won over by Mr. Stobie's glowing account of the possibilities. In the end the committee asked Mr. Stobie to prepare an estimate of the cost of equipping the new works with plant and machinery. The object of that was to see to what extent the Stobie Steel Co. would be committed if the project was

Digitized by Google

gone on with. Already they had made pig iron in the electrical furnaces at the Stobie Steel Works. Mr. Stobie's idea in acquiring the Bradley Williams works was to manufacture synthetic "pig," and he gave a glowing account of the profits which could be made out of synthetic pig iron, and said he had entered into negotiations with a Sheffield firm, Messrs. Dunford & Elliott, Ltd., to purchase all their output of synthetic pig. He also said that the machinery used for the manufacture of synthetic pig could afterwards be adapted to steel production, and that it would revolutionise the manufacture of steel by the electric smelting process. Upon that the committee sanctioned the project.

Although the hearing had stood adjourned until Wednesday, June 16th, Mr. Tomlin, K.C., mentioned the case on June 15th in the form of an application for postponement. He said that both sides had received telegrams from their respective clients suggesting the desirability of an adjournment with a view to a settlement, and he asked that the case might be allowed to stand out of the list while negotiations were taking place.

His Lordship agreed to this, and the further hearing was ultimately adjourned for three weeks.

COMPENSATION CLAIM.

AT Sunderland County Court, on June 17th, Robert Lawson Black, of Southwick-on-Wear, claimed compensation from Messrs. William Gray & Co., Ltd., of the Wear Shipbuilding Yard, for the death of his son, Robert Allan Black.

Defendants were not legally represented, but wrote offering a payment of £75 in settlement of the claim.

Mr. MALONE, barrister, on behalf of the appellant, stated that on December 16th last the deceased youth was repairing an electric wire at the Wear shipyard when the current was inadvertently switched on by some person unknown, and he was instantaneously killed. Although only 16 years of age, deceased was over six feet in height, and doing journeyman's work. He took a keen interest in his profession, and was attending technical classes with a view to improving his prospects. Under those circumstances he asked his Honour to fix the amount of compensation at £150.

Judge MOORE complied and allowed costs on C scale.

At a later stage of the day Mr. THOS. RICHARDSON, barrister, entered the Court and informed the judge that he had been instructed to appear for the defendant company, but owing to the unsatisfactory train service the solicitor concerned and himself did not arrive in the town until the case was over. He therefore asked for a re-hearing on the ground that his clients considered the sum paid into Court was adequate.

Plaintiff's solicitor said Mr. Malone had then gone, but he (the solicitor) would raise no objection to the case being reopened.

His HONOUR said he would grant a rehearing at the next sitting of the Court, but on the facts as placed before him, he did not think there was much chance of his decision being altered.

In view of this expression from the judge, Mr. Richardson said his clients would again consider the matter.

CUDDON *v.* ROBINSON.

A NOVEL and interesting point of law, arising out of the special war legislation, involving the question as to whether electrical installation for lighting purposes could be regarded as coming within the term "decorations" was raised in an action before Sir Francis Newbolt, High Courts Official Referee, which terminated on June 15th, after a hearing which occupied five days. The plaintiffs, Messrs. John Cuddon and Co., builders, of West Norwood, claimed from Mr. Henry Taylor Robinson, of Rosendale Road, Dulwich, the sum of £89, balance of account of £609 for work done and materials supplied, and the defence set up was that the contract being one for over £500 the work required the sanction of the Minister of Munitions, and such sanction not having been obtained, the money was irrecoverable. The plaintiffs' case in answer to this plea was that the work was done under orders given from time to time, and that even if the work could be regarded as coming within the terms of the order, after deducting the expense of putting in the electric light (£123) the cost would be brought down to a figure considerably below the £500.

Mr. HENRIQUES, representing the plaintiff, argued that electric lighting was not decoration, and therefore did not come within the regulation laid down by the order of July, 1916, which made it lawful for the Minister of Munitions to authorise or prohibit the carrying on of building work. But the regulation was in relation to construction work or demolition, and the question was whether the work in question could be called either the one or the other. The electric lighting was carried out by Mr. Seagrove, electrical engineer, of Dulwich, whose charges included the supply of Osram lamps, brackets, and fittings, and defendant said that when an estimate of the probable cost of the work was given to him he understood it was to include the electric light installation.

The evidence related chiefly to matters of detail, after hearing which, judgment was reserved.

The OFFICIAL REFEREE, in giving judgment on June 18th, decided that the defence of illegality had not been made out. It was, he said, abundantly clear that when the contract was made it was thought by both parties to be a smaller job than it turned out to be, although, even now, including the cost of electric lighting, it scarcely exceeded the limit of £500 named in the order of the Ministry of Munitions. The work was certainly not illegal *ab initio*, and the defendants contended that it became illegal when items were ordered bringing the cost over the limit at which time the parties ought to have known that a licence would be required, but he was not convinced that the electrical installation which amounted to £123 16s. 3d. was included in the words "construction, alteration, repairs, decoration, or the demolition of buildings," and it was clear to his mind that in this particular case the total cost of the whole completed work in contemplation relating to repairs and decorations never exceeded £500. That defence, therefore, failed. It was common ground that until the work was finished and the final account prepared neither party knew that a licence was necessary. In deciding, upon an analysis of the evidence, that plaintiffs were duly entitled to the reduced amount of £21 5s. 3d. on the claim, Sir Francis said that although the defendant had succeeded in reducing the claim, the expenses had been increased by the defence of illegality, and he therefore, in giving judgment for the plaintiffs for £21 5s. 3d., ordered the defendants to pay to plaintiffs half of the taxed costs on the High Court scale.

HUGHES *v.* BRITISH ENGINE, BOILER & ELECTRICAL INSURANCE CO., LTD.

MR. JUSTICE P. O. LAWRENCE, in the Chancery Division, on June 17th, heard an action in which Edwin Hughes, an insurance broker, of Swansea, sued the defendant company, of Manchester, for payment of commission on all policies of insurance effected with the defendant company through his introduction, and for an allowance for expenses and services rendered in connection with a scheme of "Engine Time Lost" insurance which was dropped.

Mr. R. A. WILLES, for the plaintiff, said he acted as the defendant company's whole-time agent in South Wales for ten years, viz., from 1908 to 1918, and the connection came to an end as a result of a dispute concerning the payment of expenses. The terms upon which he worked were 15 per cent. on all boiler, engine, and electrical plant insurances. There was no agreement about expenses, but the defendant company told him that if they found that he had incurred travelling expenses on their behalf, they would act in a businesslike and reasonable way.

Mr. BEEBEE, for the defendant company, said they disputed the rate of commission. While it was 15 per cent. on boiler and electrical plant policies, it was only 10 per cent. on engines.

Mr. WILLES went on to say that the "Engine Time Lost" scheme was for insurance in case of engine breakdowns, but although the plaintiff made considerable preparations for working the scheme and obtained favourable terms for underwriting the policies at Lloyd's, the defendant company were compelled to drop it, as they were bound by an arrangement with their own London underwriters to do the business through them. The plaintiff claimed something on account of the time and trouble he had been put to in connection with the matter.

Following an intimation from the judge, the parties agreed to an account being taken of the commission to be paid.

With regard to the claim for expenses and services rendered, Mr. Beebee submitted that there was no contract between the plaintiff and the defendant company.

His LORDSHIP said he should allow him something for his trouble.

Mr. BEEBEE then said the defendants were prepared to make him an entirely *ex gratia* payment of £10.

His LORDSHIP said that this would meet the case, and the plaintiff accepting, he made an order for this payment in full discharge of all claims under this head, and reserved the further consideration of other questions, including that of costs, until after the account had been taken.

UNFENCED MACHINERY.

AT the Hang East Petty Sessions the Masham & District Electric Supply Co., Ltd., were summoned for failing to have the projecting end of the main horizontal shaft at the Masham Electric Power Station securely fenced on April 15th. Mr. S. R. Bennett, H.M. Inspector of Factories and Workshops, prosecuted.

Mr. BENNETT stated that on April 15th a fatal accident occurred at the power station, and it was arising out of that that the case had been brought before the court. The shaft was 3½ in. in diameter, and was the main driving shaft of the dynamo. It was situated horizontally about 3 ft. above the floor and the end of it projected 8 in. from the bearing quite close to the passage, which was used for entering and leaving the station. On the date mentioned a youth, Frank Atkinson, aged 19, who was not an employé, visited the place for the purpose of seeing someone. His coat was caught

Digitized by Google

in the shaft, which was a revolving one, and he received injuries to which he later succumbed.

Evidence showed that the youth who was killed was wearing a mackintosh which was wet owing to a heavy shower of rain.

Mr. HEDDON, for the defendants, admitted the facts, and said the death of the youth was a most lamentable affair. The shaft was a perfectly smooth one, and it appeared that the mackintosh had stuck to it. There had now been a proper fence placed round.

The CHAIRMAN said the magistrates thought that the inspector did quite right in bringing the case, but they felt that no useful purpose could be served by inflicting a fine, as it was the publicity which was needed. They thought justice would be met by the payment of costs by the company.—*Yorkshire Herald.*

FAWCETT *v.* LINDSELL.

AT Devon Assizes, at Exeter, before Mr. Justice Bray, this action was down for hearing. Plaintiff, an electrical engineer, of Plymouth, claimed from defendant, Mr. W. J. Lindsell, of New Street, Paignton, £147 for work and material supplied in connection with an engine for a kinema theatre. There was a counter-claim, the defendant alleging that the engine was defective.

Mr. ROBERTS, for the defendant, informed his lordship that Mr. Lindsell had agreed to judgment for the full amount claimed and the dismissal of the counter-claim with costs on the plaintiff undertaking to repair the defect in the engine to the satisfaction of some engineer to be mutually agreed on.

Judgment was entered accordingly.

CHARGE OF STEALING LAMPS.

AT the West London Police Court, on Saturday, before Mr. Boyd, Jack West, 17, electrical engineer, 213, Hampton Road, Twickenham, was charged with stealing, by means of a trick, 30 electric lamps, valued at 15 guineas, belonging to Messrs. W. C. Tackley & Co., electrical engineers, 93, Hammersmith Road, W.; also 24 electric lamps belonging to the Delta Electrical Co., 584, High Road, Chiswick, and 36 electric lamps belonging to Ernest Chamberlen, electrical engineer, 196, King Street, Hammersmith.

Mr. D'ARCY HAMILTON, manager to Messrs. Tackley, said that on May 28th the accused entered the shop, and, representing himself as an agent of the City, Hall & Ellerman Shipping Co., ordered 30 half-watt lamps. He requested that a messenger should accompany him to the docks with the lamps, and said that payment would be made at the company's office. Witness dispatched a messenger with the lamps, but the lad afterwards returned without the money, and witness informed the police.

Evidence having been given, Det.-Sergt. Parsons told the magistrates that the accused had confessed to 17 cases, and had promised to assist the police to recover the property.

A remand was ordered.

THE DESIGN OF A SUPER-POWER STATION.*

By H. GOODWIN, Junr., and A. R. SMITH, of the General Electric Co., U.S.A.

(*Continued from page* 797.)

The first consideration in the electrical design is the determination of the fundamental connections between the generators, buses and feeders.

In this particular case one of the specified conditions was distribution by means of 66,000-volt underground single-conductor cables. It was decided that the concentration of energy in a short circuit on these cables should be limited to 500,000 K.V.A. on account of the possible resulting damage to adjacent cables. Comparing this with the rupturing capacity of available 66,000-volt oil switches showed that a switch having a rupturing capacity of 583,000 K.V.A. would best suit the service. It should be noted that the capacity of a generator is practically equal to the capacity of a transformer bank, and that one feeder working at full capacity would distribute the entire load of a generator and transformer bank.

Preliminary calculations proved the necessity of sectionalising the station bus by reactors in order to approach the 500,000-K.V.A. limit which had been set. Both low-tension and high-tension buses were considered, but the use of a low-tension bus was not only found unnecessary, but made the problem much more difficult. The reactance of the transformers added directly to the generators before either were connected to the bus would assist in reducing the short-circuit intensities very considerably.

The transformers in any case would have a reactance of 8 per cent. The generators would have a minimum reactance of 12.3 per cent., and under certain conditions this might be increased to 28.5 per cent. Therefore, the calculations were carried through for various values of generator reactance.

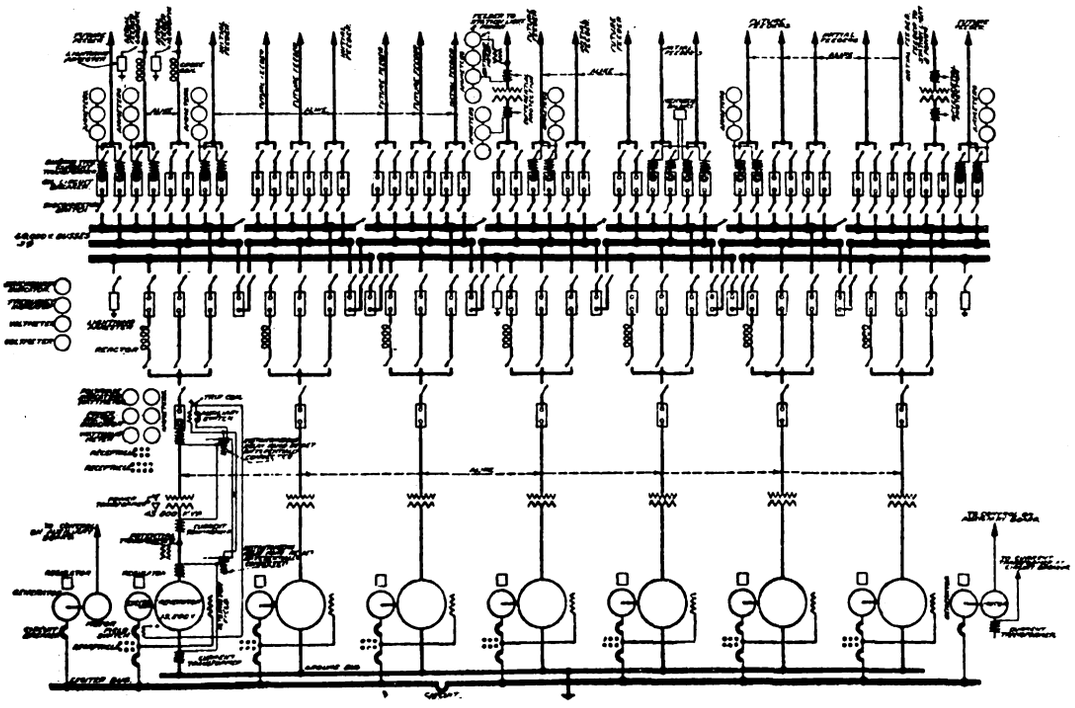

FIG. 5.—MAIN SINGLE-LINE WIRING DIAGRAM.

The minimum size of reactor which could be used with generator reactance of 15 per cent. in order to limit the short circuit intensity to approximately 500,000 K.V.A. was 9 per cent. A synchronising bus is necessary in order to limit the reactors to a reasonable size. The reactors should be rated to carry the total output of a generator.

It was desired to keep a unit arrangement right through the station, and this meant that the switchgear for each generator and its group of feeders should not occupy more length than would be required for the corresponding mechanical equipment of generator and boilers. Fortunately these

* From the *General Electric Review*, May, 1920. Abstract.

Digitized by Google

all work together very well and allow enough space on each generator stub-bus for the feeders required.

Fig. 5 shows the final solution. The neutral point of each generator will be earthed directly and positively. Since there is no low-tension bus, earthing of all generators cannot cause circulating harmonic currents between the generators. The main leads of each generator are connected directly to the corresponding transformer bank and through a main oil switch to a stub-bus.

The transformer connection is delta on the low-tension side and Y grounded on the high-tension side. It is particularly necessary that the earth resistance be made very low so that in case of short circuit on one of the single-conductor cables the neutral may not be distorted, thus placing an increased voltage stress on all the cables of the other phases.

From each generator stub-bus three connections are made; one through the reactor to the synchronising bus and the other two to double feeder stub-buses. The three selector switches connecting to the buses are non-automatic. The main switch is arranged for automatic opening in case of internal failure in the generator or transformer. This is accomplished by the use of relays differentially connected around the generator and around the transformer bank. Oil switches are shown for breaking the synchronising bus at two points, so that a section may be readily cleared for cleaning, extension, or repairs. The stub-buses are also arranged to be connected together so that at times of light load a small number of generators may carry the load of the whole station without feeding through the reactors. Referring to fig. 5, connection between the stub-buses in the lower line is provided for by oil switches, and in the upper line by horn-pipe air-break switches. The oil switches would be operated from the main bench board and the air break switches locally by hand through permanent levers.

Each feeder is equipped with two oil switches to select either of the two stub-buses. Each would be equipped with induction-type overload or other suitable type of relay, depending on the detail connection and interconnection of the distribution system.

It is thus seen that a very complete and flexible arrangement is provided. Normally, the generators are operated in parallel through the reactors and synchronising bus, but it is possible by proper interconnection of the feeder stub-buses to transfer loads from one generator to another in almost any manner desired.

Each generator will have a direct-connected exciter controlled by an automatic regulator. With this method no main field rheostat is necessary. The exciter will be provided with a field rheostat. For emergency excitation two motor-generator sets are proposed, supplying a sectionalised bus. These spare exciters will also be provided with automatic regulators. The motors driving the exciters will be supplied from the main station power board, but will be controlled from the main auxiliary board opposite the bench board. Indicating lamps on the power board will show the position of the switches so that there may be no danger of the operator of the station power board pulling disconnecting switches or otherwise interrupting service to a motor-generator exciter set while in operation.

As previously outlined, it was determined that turbines for auxiliary power would be necessary and that these should be connected with the main buses through a central auxiliary switchboard and transformers. A detailed study showed that one auxiliary turbine could best be used in connection with two main turbines, and that these auxiliary units should be rated at 2,500 KW., 0.7 p-f., 3,570 K.V.A.

For the control of the auxiliary turbines and the supply of essential auxiliary power it was found necessary to provide a switchboard near each auxiliary turbine, and for the general auxiliary power a central switchboard located on the switchboard gallery with tie cables to the four auxiliary units.

Fig. 5 shows two banks of station power transformers. It it proposed that each bank be composed of three single-phase 1,250-K.V.A. units, making a bank capacity of 3,750 K.V.A. connected delta-delta. These transformers would be located out of doors. The high-tension switches would be controlled from the main bench board and the low-tension switches from the auxiliary power board.

The reactance of the auxiliary transformers must be considered in connection with the reactance of the main units in order to limit the concentration of energy on the station power bus to a value which can be handled by reasonably small switches. Reactors are required in each of the four feeders connecting to the turbine auxiliary switchboards to limit the short-circuit intensity and permit the use of small rupturing capacity switches. It is proposed that these tie feeders to the turbine auxiliary boards be protected by differential relays connected to current transformers at each end of each line. In case of trouble on a cable it will be automatically disconnected and will allow the auxiliary turbine to continue supplying the essential auxiliaries without interruption. Reverse energy protection at the turbine auxiliary boards is also provided so that in case of a severe drop in voltage or frequency on the main system, the auxiliary turbines will be automatically disconnected and allowed to run independently, carrying the essential auxiliaries.

The central auxiliary board would be a vertical one with mimic buses and electrically-operated remote-control oil switches.

For station lighting three 75-KW. single-phase transformers controlled independently would form the supply. It is proposed that all lighting feeders be 3-wire, 115/230 volts, and be arranged in three groups which will normally operate on different transformers, but which in case of failure of a transformer can be manually thrown to one of the other transformers. By a connection from the 125-volt D.C. board, which will control the storage battery for circuit-breaker control, in case of failure of service on the A.C. lighting system certain emergency lights will be automatically connected to the battery.

The low-voltage power board is supplied by two 150-K.V.A. transformer banks operating at 240 volts, 3-phase. This board is arranged for miscellaneous power supply, such as the machine shop, turbine room cranes, house supply pumps, &c., also for the supply of motor-generator sets for charging the storage battery and a spare motor-generator exciter set for the auxiliary turbines.

(To be concluded.)

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Readers are invited to submit particulars of new or improved devices and apparatus, which will be published if considered of sufficient interest.

A New Car Lighting Dynamo.

A new dynamo for the lighting systems of light cars has recently been developed by MESSRS. H. F. FOSTER & Co., LTD., Ashley Works, Epsom, and is illustrated in fig. 1. The output regulation of this small dynamo at varying speeds is achieved by a novel method, namely, by slightly shifting the brush rocker so as to give the brushes a greater "lead" as the speed increases. This movement is imparted automatically by means of either a control arm or, if desired, a Bowden wire, one end of which is attached to the brush rocker and the other either to the accelerator pedal or to the throttle lever of the carburettor, so that as the throttle is opened the lead of the brushes is automatically increased. The advantages claimed for this method are, first, a very close and accurate regulation of output at widely differing speeds; secondly, the ability to fix the point in the output curve at which it is desired to commence the regulation at any figure desired, either for fast or slow traffic; and thirdly, the fact that until this predetermined point is reached the output is not interfered with in any way, the dynamo generating up to such point as a simple shunt wound machine. The dynamo is so designed as to ensure sparkless commutation at all positions of the brush rocker. The M-type model for light cars is extremely compact, the dimensions of the magnet frame being only some 4 in. by 4 in. by 5 in., and generates its full rated output of 50 watts at 6 volts at the exceedingly low speed, for such a small machine, of approximately 1,500 R.P.M. The automatic cut-out is incorporated as a self-contained unit in the dynamo, avoiding the necessity of mounting a separate instrument on the dash board of the motor car.

A B.T.H. Pedestal Switch.

A recently published catalogue of oil-break switchgear by the British Thomson-Houston Co., Ltd., of Rugby, includes the pedestal switch illustrated in fig. 2. This is composed of an oil-break switch (300 amps. at 660 volts), time lags, ammeter, voltmeter (up to 660 volts), and a low voltage release.

"Welco" Fixing Frames.

In view of the constantly increasing cost of labour, any device which effects a saving in that quarter is sure of a welcome. All operations that can be performed in the factory should be done there, and as little as possible should be left to do on site.

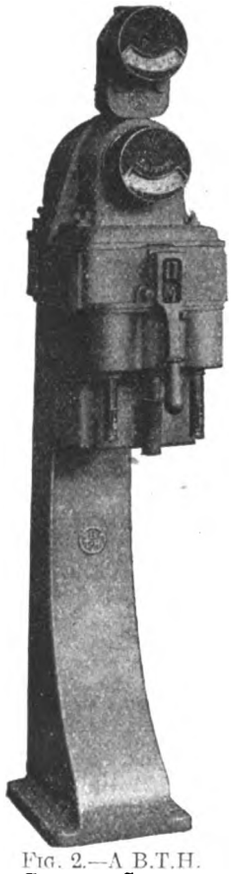

Fig. 2.—A B.T.H. Pedestal Switch.

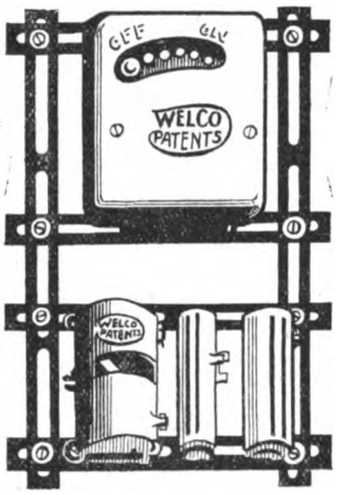

Fig. 3.—Welco Fixing Frames in Use.

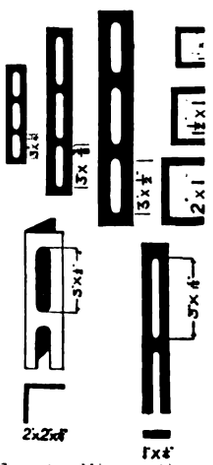

Fig. 4.—Welco Frames and Materials.

These principles are embodied in the "fixing frames" brought out by Messrs. Welco Patents, of 150, Alma Street, Birmingham. The frames consist of slotted channel bars, which are fixed direct to the wall; across these any number of slotted channel bars can be mounted with the greatest ease, forming a framework of any shape or size to carry switchgear, motor starters, meters, &c. Drilling, tapping, forging, and fitting are completely dispensed with. The bars are made in standard sizes, and in addition, mild steel channel, flat, and angle bars are stocked, all ready slotted for mounting on the frames, so that practically all requirements can be met. The simplicity and adaptability of this device are obvious, and it is certain to be found extremely useful in a great variety of applications. Fig. 3 shows a meter and switch mounted on the frame, and fig. 4 shows some of the patterns of bars and materials that have been standardised.

The fixing frames are provided with lugs giving a clearance between the frame and the wall of 1¼ in. The slotted bars are made up to 8 ft. long, and the slots can be adjusted to meet any screw or bolt holes in the apparatus to be fixed thereon; should it be necessary to fix new apparatus on the frame, it can be readjusted to suit the new spacing of the holes with facility.

Lugs for Clamping Bands.

In many cases a flexible band is necessary wherewith to constrain to a certain diameter a number of pieces to complete a whole circle. These pieces must be securely held while certain operations of boring, turning, or facing, or all of these, are being performed. The usual way is to rivet L-shaped lugs on a steel band, but this is useless for holding the segments under the lugs, as the band pulls away from the segments and these become loose. In fig. 5 a band is shown, devised by Mr. J. T. Towlson, of Silvertown, which removes this objection. The fore feet protect the lugs from bending, and so long as the lugs do

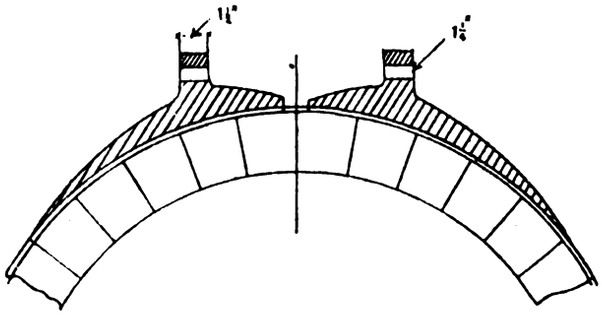

Fig. 5.—Lugs for Clamping Bands.

not bend the whole of the segments are securely held. The lugs may be riveted, but the up-to-date method is to weld them on.

An Electric Soldering Iron.

An electric soldering iron, designed by Mr. W. H. Browning and manufactured at the Imperial Electrical Works, 7-12, Imperial Mews, St. Martin's Avenue, East Ham, E.6, is illustrated in fig. 6. This is a very compact device weighing only 2¼ lb. and measuring 16½ in. in length. The main

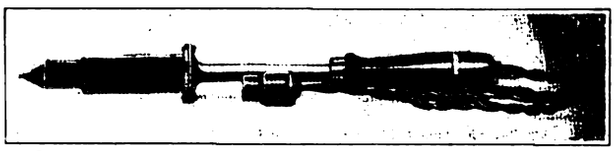

Fig. 6.—Electric Soldering Iron.

feature of this iron is that no screws are used in the construction of the heating portion, and scaling, with consequent loss of heat, is eliminated. Every part is easily renewable, and a six months' guarantee of reliability is given. The element is wound for any standard voltage, and the total loading is 300 watts.

The Decimal Association.—The report of the Association for 1919-20 gives a complete record of activities in many directions. A list of bodies to whom lectures on the subjects of decimal coinage and the metric system have been given is included, as well as the names of Chambers of Commerce and other associations and councils which have passed resolutions in favour of the adoption of the schemes for which the Decimal Association stands. In recording the Majority Report of the Royal Commission on Decimal Coinage, the Association makes it clear that the adverse result will only serve to stimulate its energies. The result of a *questionnaire* sent to over 15,000 firms, &c., resulted in an overwhelming majority in favour of the metric system. The financial statement for the year shows a deficit of £578, and it is hoped that special donations will be received from subscribers to ensure a better result for the present period.

Lighting the Albert Hall.—The Albert Hall, after preserving for so many years its Victorian atmosphere has at last linked itself with modernity through the installation of up-to-date lighting. The present lighting is provided by 16 1,000-watt Mazda half-watt type lamps in large Mazdalux metal reflectors. These units are fixed high up in the central dome, from which position they shed an intense illumination over the whole auditorium. The great height of the lamps eliminates any risk of glare, because it is impossible to see them without looking directly upwards. The improvement in the illumination, as compared with that given by the arc lamps, is extraordinary, and is due, not to any increase in the light generated, but rather to its more effective distribution, and the audience is able to read its programmes and papers with perfect ease.

In a place like the Albert Hall, where the lighting units are necessarily very difficult to get at, the question of maintenance is of extreme importance. Obviously, the new method of illumination is vastly superior to the arc lamps in this respect. The half-watt lamps need no attention whatever until the time arrives for replacement, and with the vitreous enamelled Mazdalux reflectors used the amount of cleaning required is reduced to the absolute minimum.

BUSINESS NOTES.

Openings for Salesmen.—Messrs. Fuller's United Electric Works, Ltd., wish to secure the services of a number of well-educated young men for their outdoor sales staff who have a live connection amongst garages and electrical engineers.

The King's Car.—Messrs. Vandervell & Co., Ltd., the manufacturers of the C.A.V. electrical products, have just completed the addition of their new coil ignition system to the lighting and starting installation already fitted to His Majesty's 57-h.p. Daimler. This company recently received the Royal Warrant, its equipment being fitted to the whole of the Royal fleet of automobiles.

Efficiency Exhibition.—We have received an advance prospectus of an "Efficiency Exhibition" which is being organised by the *Daily Mail* to be held at Olympia from February 10th to 26th, 1921. Special attention is being devoted to the place of science in industry, and the Electrical Development Association, the Federation of British Industries, the British Science Guild and similar bodies have offered their assistance to the scheme.

Annual Outings.—The staff of the General Electric Co., Ltd., Glasgow branch, held their annual outing on Saturday, June 12th, at Tighnabruaich. A fine programme of sports was carried through in very fine weather. After tea Mr. P. J. Sims, manager, thanked the staff for the splendid support given him during the year just closed. Mr. A. G. Hawkins, assistant manager, also addressed the staff. Mrs. P. J. Sims presented the prizes.

The Designs Section of the Engineer-in-Chief's Office, G.P.O., held their fifth annual outing on Saturday, June 19th. The party of 24 visited Richmond, walked through the Park, Ham Common, and the tow-path to Kingston, where tea was provided. After a short stay at Kingston, the party divided and made for Hampton Court by tram and steam launch respectively. The Maze proved a severe test of the mechanical training and bump of location possessed by those entering it. The glorious weather helped to make the outing the most successful yet held.

Trade with Spain.—The *Board of Trade Journal* for June 17th contains some notes giving advice to firms anxious to establish connections in the Spanish market. Those who are not quite familiar with that market would be well advised to study the suggestions that are made, as the result of reports from British Consular officers and others, respecting signature of letters, language, addresses, and style of correspondence.

American Cable for Sweden.—According to a Stockholm newspaper, a contract has been concluded with an American firm for the supply of an underground cable, to be laid between Stockholm and Gothenburg. It will be from 250 to 300 km. long, and will cost about $3,200,000. The cable, it is said, will be the longest underground cable in Europe, and the third largest in the world.

Liverpool Electrical Strike.—The strike of the Liverpool cable-jointers and street-box examiners, Electrical Trades Union men, and 200 navvies employed in cable-laying for the Liverpool Corporation electrical supply department, has been in progress now over five weeks, and there seems no prospect of an immediate settlement being arrived at. The navvies' grievance is that they are not being paid the town rate of 2s. per hour, which is paid by the Master Builders' Association. The work of relaying and repairing the Corporation cables is, therefore, being held up.

Conduits for Canada.—United Kingdom firms who can quote for early delivery of standard sizes of conduits for electrical installations are invited to cable to H.M. Trade Commissioner at Toronto ("Toroncom, Toronto"), who has telegraphed to the D.O.T. in London on behalf of an inquirer in Ontario.

Hydro-Electric Strike in Canada.—The *Times* stated on June 19th that practically all the employés of the Ontario Hydro-Electric Power Commission engaged on the Chippewa power canal were striking for a 10 per cent. increase in wages, which would add about £450,000 to the cost of the work. Two days later our contemporary reported that owing to the strike, the Commission had decided to suspend work there, and 1,500 employés would be obliged to seek work elsewhere.

Copper and Lead Prices.—Messrs. F. Smith & Co., report June 22nd:—Electrolytic copper bars, £105, £5 decrease; electrolytic sheets, no change; electrolytic wire rods, £120, £5 decrease; electrolytic h.c. wire, 1s. 3¾d., ¼d. decrease; silicium bronze wire, 1s. 11½d., ¼d. decrease.

Messrs. James & Shakespeare report June 23rd:—Copper bars (best selected) sheets and rods, £158, £3 decrease; English pig-lead, £35 10s., 10s. increase, on last week's prices.

Lamp Manufacture in Belgium.—With the title La Société Belge pour la Fabrication de Lampes Electriques L.E.B., a new company has lately been formed in Brussels (4, Montagne du Parc), with a capital of 2,000,000 fr., to manufacture electric lamps.

International Commerce.—Meetings are now in progress in Paris, attended by representatives of various British banking and commercial organisations, for the purpose of establishing an International Chamber of Commerce.

Catalogues and Lists.—The General Electric Co., Ltd., 67, Queen Victoria Street, E.C. 4.—Installation Leaflet No. P 2,327 (4 pp.). An illustrated description of the electrification of a large Scotch hosiery mill.

The Vaughan Crane Co., Ltd., Openshaw, Manchester.—Booklet No. 7 (29 pp.). A well-produced, photographically-illustrated booklet describing the "Vaughan" electric block and its application to various types of cranes.

The Anglo-Mexican Petroleum Co., Ltd., 16, Finsbury Circus, E.C. 2.—"The Story of Mexican Petroleum" (35 pp.). A photographic record of the work of the company, reproducing from pictures on exhibition at the Crystal Palace some excellent views of Mexican oilfields, &c.

Messrs. Mann, Egerton & Co., Ltd., Norwich.—Booklet, "The Sign of Service," giving a *résumé* of the firm's various departments and their activities and addresses.

Messrs. Higgs Bros., Dynamo Works, Sand Pits and Summer Hill Street, Birmingham.—Latest abridged list of A.C. and D.C. motors. Priced and illustrated.

Messrs. Charles Churchill & Co., Ltd., 9-15, Leonard Street, Finsbury, E.C. 2.—Pamphlet illustrating "Fluxio" high-speed tipped cutting tools of various types.

Messrs. R. B. Hand & Co., Ltd., 63, High Holborn, W.C.1.—Up-to-date price-list of electrical fittings, including most wiring necessaries, conduits, cables, switches, &c.

Messrs. Watson & Sons (Electro-Medical), Ltd., Sunic House, Parker Street, W.C. 2.—Leaflet (265) dealing with clocks for timing X-ray exposures and the Smart-Bristow medical coil. Illustrated and priced.

British Insulated and Helsby Cables, Ltd., Prescot, Lancs.—Two illustrated leaflets, No. H 89, dealing with Leclanché batteries; and P 161, describing "Prescot" jointing materials and accessories, including compounds, tapes, and connectors. The latter is fully priced.

Dissolutions of Partnerships.—Wheeler & Ison, electrical and mechanical engineers, Homeleigh, Whippendell Road, and 190, Harwoods Road, Watford.—Messrs. G. Wheeler and W. Ison have dissolved partnership.

Wood & Hague, ignition and lighting specialists, 1A, Saunders Street, Southport. Messrs. T. & J. Hague and S. Wood have dissolved partnership. The Messrs. Hague will attend to debts and continue the business.

Trade Announcements.—Mr. W. Johnston, for over 30 years with Messrs. Wm. Dow & Sons, Ltd., has, with his son, commenced business as electricians at 20, St. Andrew Street, Kilmarnock, under the style of William Johnston & Son.

Mr. R. Millett has been recently appointed by the Electric Construction Co., Ltd., Wolverhampton, as their sole Lancashire and Yorkshire agent. Offices, 30, Cross Street, Manchester. Tel. No.: 7772 City.

Messrs. E. Shipton & Co., of 14, Great Queen Street, Kingsway, W.C. 2, announce that on June 28th their business will be transferred to larger premises at 52, Floral Street, Covent Garden, W.C. 2. Telephone No.: Gerrard 374.

Owing to expiration of lease, Mr. E. Goldston, electrical engineer, 28, Marefair, Northampton, has removed to temporary premises at 13, Horsemarket, Northampton.

The B.E. Co. (of London and Birmingham), Ltd., is desirous of appointing agents for its Hendon drawn-wire lamps, not for its general supplies.

Company Liquidations.—The Kinetic Co., Ltd.—Winding up voluntarily. Liquidator, Mr. T. Rimington, 43, Gallowtree Gate, Leicester.

Telephone Manufacturing Co., Ltd.—Winding up voluntarily for reconstruction purposes. Liquidators, Mr. F. T. Jackson and Mr. C. W. Rooke.

Selson Engineering Co. (France), Ltd.—Meeting of creditors is called for June 28th, at 85, Queen Victoria Street, E.C.

Norman, Johnson & Co., Ltd.—Voluntary liquidation. Mr. J. K. Garioch, 16, King Street, E.C. 2, liquidator. Meeting of creditors, June 30th.

For Sale.—West Hartlepool Corporation Electricity Department has for disposal one 600-kw. Belliss-Parker D.C. generator set; also one 100-kw. Belliss-Crompton D.C. generator.

By direction of the Disposal Board, Ministry of Munitions, Mr. H. Baskett will sell by auction, on July 13th, 14th, and 15th, at the Ordnance Stores, Abbey Field, Colchester, a quantity of electrical stores, including cable, telephone sets, switchboards, &c.

Assets Auctions Co., Ltd., will sell by auction, at 119-121, Newington Causeway, S.E., on June 30th, the stock of an electrical goods factor.

Wigan Corporation Electricity Department invites offers for one Willans high-speed compound engine and condenser, direct-coupled to Dick, Kerr 560-volt generator; also a quantity of spares. Full particulars are given in our advertisement pages to-day.

White City Motor Show.—There is to be a great motor show at the White City in November. The buildings there have now been vacated by the Government, and members of the Society of Motor Manufacturers and Traders are to fully co-operate in the display. A further series of exhibitions representative of the various trades and industries of the country will follow.

Lead.—In their report dated June 19th, Messrs. James Forster & Co. say :—

We estimated last week a current consumption of 145,000 tons per annum, which we considered less than the actual. We are informed by actual consumers that the consumption of sheets and pipe has averaged 5/6,000 tons per month since May last year. We are also informed that the consumption of the electrical trades is nearer 100,000 tons a year than our figure of 60,000 tons. Our total should therefore be increased to 180,000 tons, or 15,000 tons per month, against which we have in available imported lead 30,000 tons in the last seven months. This condition of things is certainy not reflected on the London Metal Market, where values have been knocked down daily by continued realisation of old "Bull" accounts, and on Wednesday reached the heavy fall of £3 per ton on the day. . . . Consumers, naturally, have been absent, and there has been little export demand.

Messrs. G. Cawson & Co. state :—

The liquidation of the June account in lead has continued; in fact this account has turned out to be much larger than anticipated. June lead sold down to £31 5s. At the decline consumers have come forward and bought considerable quantities. The lower prices no doubt have encouraged them to cover not only prompt but also some of their forward requirements. Quite a good business has been done in all positions. The market has now a healthier appearance. There has been a little more export enquiry. . . . We calculate roughly that the total quantity of Australian lead still to be shipped is about 30,000 tons. Part of this, however, may go to the States, so that if the strike is not soon settled we may perhaps see some scarcity of lead later in the year. Many things, however, may happen before this occurs. Meanwhile, the supply of lead is ample. . . . The outlook is now decidedly more encouraging, and the lower level of prices will no doubt bring fresh buyers.

Electrical Window Displays.—The contributor of a recent article entitled "What is the Contractor Doing?" mentioned among other matters the want of attractive window displays. The criticism appears to be justified, and it is to be hoped that at a time when the public interest can be easily drawn to electrical labour and coal saving and dirt-avoiding appliances, there will be a greater display of show-window originality and enterprise in all our big centres. Messrs. A. Emanuel & Sons, Ltd., of George Street, Manchester Square, W.1, who have written to us on this matter, hold that the criticism is particularly applicable to British manufacturers, while American firms in this country are alive to this important side of electrical selling. They have sent us the accompanying photograph of a window display of electrical cooking devices, which shows the co-operation that

ELECTRICAL WINDOW DISPLAY.

is sometimes noticeable between the contractor and the American manufacturer. The contractor in this case was not very easily persuaded to agree to the window display, but we are assured that the results have been remarkable considering that this was his only shop, and that it was in a side thoroughfare. We would urge manufacturers and contractors to co-operate enthusiastically along such lines, for we believe that the effort would be well worth while.

Herr Deutsch on German Industrial Conditions.—According to the *Economic Review*, the *Excelsior* publishes a statement by Herr Deutsch, a director of the A.E.G., concerning the effect of a Franco-German economic rapprochement and present conditions in Germany. Such a rapprochement would, he averred, have excellent results, and France need not fear Germany's competition, as the latter was scarcely in a position to carry out the orders already in hand. The whole world was inundating Germany with orders far beyond her present capacity. The word "sale" had no longer any meaning; in future, it would only be possible to speak of "production." The eight-hour day was a calamity for the whole world. If normal conditions were ever to be restored the miners must work ten hours, and all other workers twelve hours a day. Production was everywhere hampered by the lack of labour. Germany would call upon her workers to strain every nerve, and they would obey without fail, if only wholesome and ample food could be assured; otherwise all efforts would be in vain. In reply to the question whether the Customs tariff would have to be altered if an agreement were reached, Herr Deutsch said that no change would be made at present, but the commercial treaties would have to be revised at a later date. With regard to Germany's foreign exchange, he declared that it would recover for a space, but would then, he believed, experience another heavy fall.—*Neue Freie Presse*, May 26th.

Notes on Trade with Japan.—The Commercial Counsellor to H.M. Embassy at Tokio (Mr. E. F. Crowe, C.M.G.), has recently made a tour among firms and works in this country. In the *Board of Trade Journal* he writes :—

"This is my third experience in visiting the industrial centres in this country, and on each occasion I have found that the interest displayed in foreign trade has grown. In the past, complaints have often been made about British manufacturers not adapting themselves to the needs of particular markets, but as far as my own experience goes I have been surprised at the wonderful adaptability of the British manufacturer and his keenness to seek trade abroad, and his anxiety to conform to foreign requirements. Many of the firms are, of course, booked far ahead, but they are prepared to allot part of their output to foreign buyers, and all of them appear to be anxious to avail themselves of the machinery which the Government have now placed at their disposal for the purpose of collecting information abroad. In the course of my tour I have met several associations of manufacturers and merchants, and it has been possible, with their assistance, to draw up forms of questionnaires giving the kind of information which is needed by firms in this country. It is hoped that by adopting this system a great mass of useful information will be collected and will be immediately available for those who require it."

He says that the subject which has come up for discussion most frequently has been that of trade marks. It is well-nigh impossible in England to talk about trade with the Far East without touching on this complicated subject, complicated for two reasons: (1) That in China there is as yet no trade mark law, and that the arrangements for the mutual protection of trade marks as between the various countries, have not yet been completed; and (2) that unfortunately as regards Japan there have been a very great number of piracies. Goods bearing imitations of British trade marks have found their way into many parts of the world, and the complaints received have been very numerous. Japan is a signatory of the International Convention for the Protection of Industrial Property, and due protection is given to firms who have registered their trade marks in Japan, but much of the trouble has arisen from the fact that there have been imitations of marks of those firms who have not actually done business in Japan, and have consequently not registered their marks there, while there have also been imitations which, though not exactly close copies, are near enough to deceive the ordinary purchaser who is not well acquainted with the English language.

"At the present moment interest in Japanese trade undoubtedly centres in the immediate crisis. At a time when nothing but cancellations of orders are in the air, it is practically impossible to place new business, but I feel convinced that the future is rosy, and that very shortly matters will be adjusted, and a great many orders will once more be placed in England for those types of British goods which have deservedly earned so high a reputation in Japan in the past."

There has been a good deal of misapprehension about wages in Japan. Many people in England still think that a Japanese workman gets about sixpence a day and a bowl of rice. It is difficult, after there has been much talk of cheap Japanese competition, to make people realise that the cost of living has advanced more in Japan since the war than in either England or the United States, and that the average Japanese workman expects to receive about 7s. a day.

There are a large number of minor questions affecting Japanese trade, but on the whole it may be said that the chief problems at the moment are, on the one side, trade marks and quality of export goods, and on the other delivery of cotton spinning machinery. For the moment there is to be added also the all-important question of the cancellation of contracts above referred to, but it is to be hoped that when the banks find themselves in a position to render the usual facilities these difficulties will be got over and trade will once more run in its normal channels. The storm will have cleared the air, conditions will be much healthier, and the ordinary business man will be able to continue his steady and profitable business unhampered by the wild alarums and excursions introduced by the irresponsible speculator whose innings has now been terminated.

Bankruptcy Proceedings.—C. J. F. HAYMAN, electrical engineer, lately carrying on business at 96, Woodhouse Road, Leytonstone, and 1, Goodmayes Road, Goodmayes.—The first meeting of creditors was held on June 15th at the London Bankruptcy Court, before Mr. D. Williams, Official Receiver, under this failure. The debtor filed his own petition on June 2nd. He has stated that in January, 1919, being without capital, he took an empty shop at 96, Woodhouse Road, and there commenced to trade in the name of Cuthbert Hayman, as an electrical engineer. At first he was successful, but owing to difficulty in obtaining copper wire, he was unable to carry out all his orders. He was further handicapped by

Digitized by Google

lack of capital, and in December last he was advised to convert the business into a company. A Mr. Wood, to whom he was introduced, told him that he had several friends willing to take up shares, and early in December Hayman, Wood and Co., Ltd., was registered with a nominal capital of £4,000, of which £825 was subscribed within a week. He (debtor) was appointed managing director at a salary of £500 per annum, but in all he only received about four weeks' salary. As vendor he was allotted 700 shares for the stock (valued at between £300 and £400) and the goodwill; the registered office was at 45, Cheapside, E.C., but the business was carried on from Leytonstone and Goodmayes. The trading at the latter place was a failure, and the company gradually declined through want of capital, with the result that the business was closed down, and he was now employed as a fitter. The company agreed to take over the whole of his liabilities with the assets, but was unable to carry out its obligations to pay the debts, and in March last one of the creditors obtained judgment and levied execution upon his furniture. Further pressure followed, to escape which the debtor filed his petition. He now owes between £200 and £300 and has no assets whatever. The case was left in the hands of the Official Receiver to be administered in bankruptcy.

I. J. HODSON and B. H. NEWMAN (Hodson & Newman), electrical engineers, 85, Queen Street, Exeter.—Receiving order made June 17th on debtors' own petition. First meeting, July 1st; public examination, July 8th, both at Exeter.

GEORGE FREDERICK KIVERSON, electrical engineer, Goulders Place, Attercliffe Common, Sheffield, late 38, Shrewsbury Road, Sheffield.—The following are creditors:—

General Electric Co.	£188
Siemens Bros., Ltd.	76
Siemens Bros. & Co., Ltd.	159
Edison Swan Electric Co., Ltd.	178
Metropolitan-Vickers Electrical Co., Ltd.	31
Western Engineering Co.	12

A Modern Installation. — The electric lighting and power installation at the Metropolitan Water Board's new offices has been carried out by MESSRS. STRODE & CO., LTD., on their improved steel conduit system of wiring; they have also installed their special system of telephones, fire alarms, and electric bells. From the electric lighting mains sub-mains are carried to sub-distributing boards, from which circuits are run to the various lights, the whole of the cables and wires being in heavy gauge screwed enamelled steel conduit. Similar mains are also taken to the main power panel, from which sub-power mains are run to distributing boards for various motors. The lighting installation includes about 3,000 lights, and the power installation for the various motors totals about 200 H.P. Approximately 100,000 ft. of steel tube has been fitted for the lighting and power wiring, and about 40 miles of cable. For the electric bells and telephones about 20 miles of wire has been employed. A special system of telephone communication has been provided to 74 stations, in addition to the G.P.O. system for which Messrs. Strode have provided the necessary steel conduits. Forty fire alarms have been fitted at various points, and a special call system to ring up the various departments has been installed at 32 stations. Sixty "Magneta" clocks have been fitted throughout the building. The electric light fittings were manufactured to special designs of the architect.

Garden Settlements for Steel Workers.—A considerable number of houses, in every way superior to those to which most workers have hitherto been accustomed, is now being built by John Brown & Co., Ltd., for the steel workers employed at their new steel foundry at Scunthorpe, Lincolnshire. These houses are of the bungalow type, constructed of concrete slabs, and with a careful regard to interior domestic conveniences. Each house, moreover, is provided with its own allotment plot, or garden. An extension of the same idea is, in addition, being carried out by the company in conjunction with several other large firms in the Scunthorpe district; a considerable estate is being developed there on garden city lines. A large number of houses is being erected, mostly of brick, and all the resources of modern town-planning utilised to provide in this busy manufacturing centre a healthy and picturesque residential quarter equipped with ample open spaces, and amenities associated with country, rather than industrial life.

Insurance Against Unemployment.—In the course of discussion at the annual meeting of the National Alliance of Employers and Employed at Birmingham, it was strongly urged that the Alliance should take up this problem and produce a scheme satisfactory to both parties. As a result the following committee has been appointed:—On the trade union side,

Mr. Arthur Pugh, of the Iron and Steel Trades Confederation.
Miss Julia Varley, Women's Branch of the Workers' Union.
Mr. Harry Dubery, of the Federation of Post Office Supervising Trade Unions.

The employers' representatives are:—

Major D. C. McLagan, of the National Federation of Iron and Steel Manufacturers.
Mr. Charles Tennyson, of the Federation of British Industries.
Mr. Philip H. Lockhart, of Messrs. W. & A. Bates, Ltd.
Mr. T. E. Jackson, of the Incorporated Association of Retail Distributors.

This committee will meet at an early date to make investigations, set out a general questionnaire, and obtain evidence.

Employés' Investment Scheme. — Messrs. Rashleigh, PHIPPS & CO., LTD., electrical engineers and contractors, of Oxford Street, W., have adopted an investment scheme giving an opportunity to their employés to take an interest in the business. Out of an issued capital of £23,000 in £1 shares, 2,000 are described as employés' shares. The profits are divisible as follows: First payment, 6 per cent. per annum on employés' shares; second payment, 6 per cent. per annum on the ordinary shares; third payment, division of the surplus among both classes of shareholders in proportion to the capital paid up. The employés' 6 per cent. has therefore first claim. If there were a bad year and the 6 per cent. could not be paid, the dividend would be cumulative, and have first claim in the following year if that were not also a bad year. In the event of liquidation the employés' payments for shares would be repaid in full after the satisfaction of the company's creditors. Shares may be bought either outright or in instalments. If an employé leaves he must sell his shares to the directors for re-issue to other employés; he can only hold them at the directors' discretion. A pamphlet explaining the scheme has been issued, and no doubt the company would forward a copy to anybody interested.

Book Notices.—"The Decimal Educator." June, 1920. (31 pp.). London: The Decimal Association. Price 6d.—This little quarterly maintains its high standard, and the number before us is particularly interesting. The report of the Royal Commission on Decimal Coinage is ably criticised; we note that although 74 per cent. of the evidence from individuals or bodies outside official circles was favourable to decimal coinage, the majority reported against the very principle of decimalisation, a verdict which has never before been given by any inquiry, and which we venture to assert is contrary to the judgment of the great majority of the community.

"*Journal* of the British Science Guild, No. 11" (obtainable on application to the Secretary, 6, John Street, Adelphi, W.C. 2, price 1s. 1½d., including postage). Contains annual report of Guild for 1919-20; and memoranda on the Milk Question; State Awards for Scientific and Medical Discovery; Utilisation of Science in Public Departments; Army Hygiene in the War and After, &c.

"The How and Why of Radio Apparatus." By H. W. Secor. New York Experimenter Publishing Co., Ltd. Price $1.75.

"A Theory of Metallic Arc Welding." (11 pp.) By Ralph G. Hudson. Massachusetts Institute of Technology.—An illustrated reprint from the *Journal* of the American Welding Society, recording observations of the electric arc during welding operations, and deducing an explanation of the nature of the welded joint.

The "Bulletin" for 1918 of l'Association des Ingénieurs sortis de l'Ecole de Liége. (163 pp.).—Accounts of the six sections of the Association are given, and the commencement of a seventh at Hasselt is recorded. It is noticeable in the reports of meetings of the Association that purely technical discussions have been replaced by the study of the new economic conditions and problems attending the reconstruction of devastated Belgium.

"*Journal* of the American Institute of Electrical Engineers." Vol. XXXIX, No. 6. June, 1920. Annual Convention number. New York: The Institute. Price $1.

"Elements of Radiotelegraphy." By E. W. Stone. Pp. xii + 267; 125 figs. + 33 plates. London: Crosby Lockwood & Son. Price 16s. 6d. net.

"The Tramways and Light Railways Association *Journal*." Special Congress number. No. 210, June, 1920. London: The Association, Caxton House, S.W. Price 2s.

"Übersichtskarte der Elektrizitäts-unternehmungen und Gaswerke in den Nationalstaaten der ehemaligen österreichisch-ungarischen Monarchie," and "Übersichtskarte der Elektrischen Eigenanlagen in den ehemaligen österreichischen Ländern." Vienna: Verlag für Fachliteratur.—Two large maps compiled by Dr. Viktor Stöger, showing undertakings in Austria, Hungary, Czecho-Slovakia, Jugo-Slavia, Galicia, &c., indicating size and type of plant.

Strike.—Last week there was a strike of 300 employés of MESSRS. FALK, STADELMANN & CO., LTD., of Farringdon Road, London, on the question of wages and union membership.

Electricity Supply Rifle League. — We have received from Mr. E. Mathews, hon. sec., particulars of the matches of the league up to May, 1920, from an inspection of which it appears that very creditable results have been achieved. The Metropolitan Co's team that won the championship last year is unbeaten for the first half of the season, whilst Shoreditch has put up the best score—viz., 582—and Mr. Marriott, of Hackney, is the first to score a possible in this season's competition.

The Australian Trade Commissioner's Visit.—H.M. Senior Trade Commissioner in Australia (Mr. S. W. D. McGregor), who is now in this country, will commence a tour of certain areas on Tuesday, July 13th. He will begin in London, and firms who are desirous of meeting him should communicate with the Department of Overseas Trade, at 35, Old Queen Street, S.W.1. Provincial firms should apply to the Secretary of their Chamber of Commerce.

Home Counties (No. 9) Electric Supply Industrial Council.—The schedule of consolidated rates has been got out by the Home Counties (No. 9 Area) Industrial Council, and approved by the National Council and circulated to the Member-Companies, the date from which the schedule becomes operative being May 1st.

Digitized by Google

LIGHTING AND POWER NOTES.

Ayr.—BULK SUPPLY.—The Corporation has been recommended by the Electricity Commissioners to negotiate for a bulk supply of electricity from the Kilmarnock Corporation.

Australia.—MELBOURNE STRIKE SETTLED.—The City Council ratified a proposal to grant the electricians an increase in wages of 3s. 6d. a day, and the strikers resumed work on June 18th. The whole trouble relating to the electricity supply is now ended, and lighting and power for the tramways will be made available.

Birmingham.—YEAR'S WORKING.—The total revenue for the past year's working of the electricity undertaking was £1,068,826, and expenditure £776,291, leaving a gross balance of £292,535. The payment of loan charges, &c., left a net surplus of £15,324. The total number of units sold was 127,938,924, at an average price of 2·005d. per unit.

Canada. — HYDRO-ELECTRIC DEVELOPMENTS. — The *Canadian Engineer* gives details of a new hydro-electric development, plans and specifications of which have been recently prepared by the Hydro-Electric Power Commission of Ontario. This project is to utilise the power afforded by the Ranney Falls, about one mile below Campbellford, Ontario. Two 5,000-H.P. turbines are to be installed, coupled to two three-phase, 60-cycle, 6,600-volt generators, each of 4,500 K.V.A. capacity. Under normal conditions a head of 47 ft. will be available. This will be the ninth installation in the Trent and Severn divisions.

Carlisle.—SUPPLY SCHEME.—A scheme for supplying a number of Cumberland villages, including Wigton, is under consideration.

Burnley.—EXTENSIONS.—In connection with the extensive scheme for the improvement of the undertaking, the Electricity Committee has now recommended the Council to place the contract for the work with the English Electric Co., Ltd., Preston, the total amount of the tender being £107,400.

Bury.—LINKING-UP.—In connection with the scheme for inter-supplies of electricity between the Corporation electricity department and the Lancashire Electric Power Co.'s works at Radcliffe, the Town Council proposes to apply for sanction to borrow £95,000 for the necessary extensions at the electricity works. After consultation with the company, the engineer has placed orders for the tranformers required. To meet present obligations, Heywood requires 1,870 H.P. and Radcliffe 1,440 H.P. in addition to their present supplies. Subject to the scheme being approved by the Electricity Commission, and the sanction of the Minister of Health being obtained to borrow the money, a contract is to be placed for the supply of an 8,000-10,000-KW. set.

No change is to be made in the charges for electricity by the Corporation until the end of the present quarter.

Chester-le-Street.—PROPOSED ELECTRICITY SUPPLY.—The Rural District Council has decided to obtain prices for the supply of electricity for comparison with prices of gas supply to the Council's housing scheme at Washington.

Chirk.—ELECTRIC LIGHTING.—At a special meeting of the Rural District Council, held to consider the lighting question, the chairman stated that, in view of the small population, he did not think that electric lighting would be remunerative, while another member urged that the gasworks should not be proceeded with until it was known what an electricity scheme would cost. Ultimately it was decided to ask Mr. G. Bremner Smith to advise the Council on the matter.

Co. Dublin.—ELECTRICITY SUPPLY.—The question of having a centralised electricity supply for the Co. Dublin coast townships was mentioned at the Blackrock Urban Council, when a letter was received from the Electricity Commission to the effect that the Commissioners were in communication with the Dublin Corporation, and were suggesting that a bulk supply should be given to Blackrock and Pembroke. It was hoped to deal with the matter as soon as the Corporation had gone into it. The Kingstown Urban Council appointed a Committee to consider a scheme for the lighting of the township by electricity, with a view to having a centralised source of supply for the other townships of the surrounding district, a conference is being convened to consider the proposal, to which representatives of Blackrock, Dalkey, Killiney, and Rathdown, are being invited.

Colwyn Bay.—YEAR'S WORKING.—The chairman of the Lighting Committee announces a profit of £217 for the year ended March 31st last.

Cullompton (Devon).—LIGHTING SCHEME.—The promoters of the electric light scheme have decided to go on with the project, a circular letter to householders to ascertain the probable number of consumers having proved highly satisfactory.

Dalkeith.—EXPERT ADVICE.—The Town Council has requested the Electric Supply Corporation to allow an independent engineer to examine and report on the plant in the works at Croft Street, in view of the unsatisfactory lighting provided in the town last winter.

Devonshire.—ELECTRICITY SUPPLY.—For the purposes of electricity supply, Devonshire has been divided into four sections, with centres at Plymouth, Exeter, Torquay, and Barnstaple. Since this partition was made, a map has been prepared, introducing a part of Somerset and part of Cornwall into the scheme. A Committee of the Devonshire County Council will meet the Electricity Commissioners on June 29th in London, to confer on the scheme.

Electricity Districts.—The Electricity Commissioners have provisionally determined that the undermentioned areas shall be constituted separate electricity districts for the purposes of the Electricity (Supply) Act, 1919 :—

WEST RIDING.—The cities and county boroughs of Bradford, Leeds and Wakefield; the county boroughs of Barnsley, Dewsbury, Halifax and Huddersfield; the municipal boroughs of Batley, Brighouse, Keighley, Morley, Ossett, Pontefract, Pudsey and Todmorden; the urban districts of Altofts, Ardsley, Ardsley East and West, Baildon, Barkisland, Barnoldswick, Bingley, Birkenshaw, Birstall, Burley-in-Wharfedale, Calverley, Castleford, Clayton, Clayton West, Cudworth, Darfield, Darton, Denby and Cumberworth, Denholme, Dodworth, Drighlington, Earby, Elland, Emley, Farnley Tyas, Farsley, Featherstone, Flockton, Garforth, Gildersome, Golcar, Goole, Greetland, Guiseley, Gunthwaite and Ingbirchworth, Haworth, Hebden Bridge, Heckmondwike, Hipperholme, Holme, Holmfirth, Honley, Horbury, Horsforth, Hoylandswaine, Hunsworth, Ilkley, Kirkburton, Kirkheaton, Knottingley, Lepton, Linthwaite, Luddenden Foot, Marsden, Meltham, Methley, Midgley, Mirfield, Monk Bretton, Mytholmroyd, New Mill, Normanton, Oakworth, Otley, Oxenhope, Penistone, Queensbury, Rawdon, Rishworth, Rothwell, Royston, Scammonden, Selby, Shelf, Shelley, Shepley, Shipley, Silsden, Skelmanthorpe, Skipton, Slaithwaite, South Crosland, Southowram, Sowerby, Sowerby Bridge, Soyland, Spenborough, Stainland, Stanley, Thurlstone, Thurstonland, Whitley Upper, Whitwood, Wombwell, Worsborough and Yeadon; the rural districts of Barnsley, Goole, Halifax, Hemsworth, Hunslet, Keighley, Penistone, Pontefract, Selby, Tadcaster, Todmorden, Wakefield, Wetherby and Wharfedale and the parishes or townships of Addingham, Bank Newton, Beamsley, Bolton Abbey, Bracewell, Bradleys Both, Brockden, Broughton, Carlton, Coates, Cold Coniston, Cononley, Cowling, Draughton, Elslack, Embsay-with-Eastby, Farnhill, Gargrave, Glusburn, Halton East, Hazlewood-with-Storiths, Kildwick, Lothersdale, Martons Both, Salterforth, Thorlby-with-Stirton and Thornton, in the rural district of Skipton.

SOUTH-EAST LANCS.—In the County of Lancaster: The City and County Borough of Manchester: The County Borough of Bolton, Bury, Oldham, Rochdale, Salford and Wigan: The Municipal Boroughs of Ashton-under-Lyne, Eccles, Heywood, Leigh, Middleton and Mossley: The Urban Districts of Abram, Ashton-in-Makerfield, Aspull, Atherton, Audenshaw, Billinge, Blackrod, Chadderton, Crompton, Denton, Droylesden, Failsworth, Farnworth, Golborne, Haydock, Hindley, Horwich, Hurst, Ince-in-Makerfield, Irlam, Kearsley, Lees, Littleborough, Little Hulton, Little Lever, Milnrow, Norden, Orrell, Prestwich, Radcliffe, Ramsbottom, Royton, Standish-with-Langtree, Stretford, Swinton and Pendlebury, Tottington, Turton, Tyldesley-with-Shakerley, Upholland, Urmston, Wardle, Westhoughton, Whitefield, Whitworth and Worsley: The Rural Districts of Barton-upon-Irwell, Bury, Leigh, Limehurst and Wigan; and the Township of Rixton-with-Glazebrook in the Rural District of Warrington.

In the County of Chester: The County Borough of Stockport: The Municipal Boroughs of Dukinfield, Hyde and Stalybridge: The Urban Districts of Alderley Edge, Altrincham, Ashton-upon-Mersey, Bowdon, Bredbury and Romiley, Cheadle and Gatley, Hale, Handforth, Hazel Grove and Bramhall, Hollingworth, Knutsford, Lymm, Marple, Mottram-in-Longendale, Sale and Wilmslow: The Rural Districts of Bucklow and Tintwistle.

In the County of Derby: The Municipal Borough of Glossop: The Rural District of Glossop Dale.

In the West Riding of the County of York: The Urban Districts of Saddleworth and Springhead.

Objections or representations may be made on account of the inclusion of any area in, or the exclusion of any area from, the districts so provisionally determined, and all such objections or representations must be made in writing addressed to the Secretary, Electricity Commission, Gwydyr House, Whitehall, London, S.W. 1, stating the grounds upon which the objections or representations are made, and must reach the said offices of the Commissioners not later than October 31st, 1920.

It being apparent to the Electricity Commissioners that the existing organisation for the supply of electricity in the districts so provisionally determined should be improved, notice is further given that they intend to hold local inquiries into the matter, and any authorised undertakers, as defined in the Electricity (Supply) Act, 1919, any County Council, any local authority, any railway company using, or proposing to use, electricity for traction purposes, any large consumer of electricity, and any association or body directly concerned with the production or use of electrical energy within the districts, may, on or before the said 31st day of October, 1920, submit in writing schemes for effecting such improvement in organisation, including the formation of joint electricity authorities for the districts, and any proposals for altering or adjusting the boundaries of the districts so provisionally determined.

Notice will be given of the dates of the proposed inquiries.

Exeter.—YEAR'S WORKING.—The electrical engineer reports a surplus of £1,833 for the year ended March 31st, comparing favourably with a deficit of £1,735 for the previous year. This result is attributed partly to increased prices, and partly to the removal of lighting and power restrictions.

Digitized by Google

Derby.—PAYMENT OF "AWARD."—The failure of the Corporation to give effect to the £30 bonus award, as from Jan. 1st, led to the presentation of notice to withdraw by members of the staff. A special meeting was called, when it was decided to accede to the terms of the award by paying the bonus from the stipulated date.

Federated Malay States.—ELECTRICITY SUPPLY.—The *Board of Trade Journal* states that the Governor of the F.M.S. recently foreshadowed a scheme for the uniform supply of electricity to the States and Straits Settlements for power, drainage, and railways. An expert has been engaged to investigate and formulate a scheme.

Fleetwood.—LOAN.—Application is to be made to the Electricity Commissioners for sanction to borrow £5,000 for new mains and services, and £2,000 for the provision of meters for the Council's housing scheme.

PRICE REVISION.—The Urban District Council has decided to apply to the B.O.T. for an order under the Statutory Undertakings (Temporary Increase of Charges) Act, 1918, for such modifications of the Fleetwood Electric Lighting Order, 1908, as will enable the Council to charge a flat rate of 8·4d. per B.O.T. unit.

Hinderwell.—ELECTRIC LIGHTING SCHEME DEFERRED.—The Cleveland and Durham E.P. Co. has informed the Urban District Council that with reference to the electric lighting scheme it would be necessary for the Council to lay its own cables, as the town is outside the company's area. The cost would be at least £6,000, in addition to from £2,000 to £3,000 for a sub-station, and the cost of a prov. order. The Council has decided to defer the matter, and to await mining developments in the district.

Kingston-upon-Hull.—YEAR'S WORKING.—The statement of accounts for the year ended March 31st last records a total income of £218,136, as against £144,369 for the previous period. The expenditure increased by 32 per cent. to £166,724, leaving a gross surplus of £51,412. The deduction of income-tax, loan interest, &c., resulted in a net balance of £8,931, of which £7,987 was transferred to the reserve fund, the remainder cancelling a deficit of £944 from last year.

Leeds.—YEAR'S WORKING.—The total income of the electricity undertaking for the year ended March 31st, was £230,895, as against £141,767 for the previous year. Expenditure, including loan charges, income-tax, &c., amounted to £186,486 against £141,118, leaving a gross surplus of £44,409, comparing with a profit of £649 for 1918-19. The total number of units sold increased from 63,387,433 to 63,023,502, and the average price per unit from 1·26d. to 1·79d.

Littleborough.—HOUSING SCHEME.—The General Purpurposes Committee of the Urban District Council has instructed Mr. Hawtayne, electrical engineer, to prepare plans and estimates for cables and fittings for the supply of electricity to the houses which are to be erected by the Council at Calderbrook, as well as for the street lighting in connection with the scheme.

Liverpool.—STRIKE.—The Executive Committee of the Electrical Trades Union has ratified the action of the cable jointers and street-box men employed by the Liverpool Corporation, who are on strike for higher wages. The Mersey District Secretary of the Electrical Trades Union has resigned from the Joint Industrial Council for the Electricity Supply Industry, one of the reasons, we understand, being that the Council has not held a meeting during the several weeks this dispute has been in progress.

London.—ST. MARYLEBONE.—The statement of accounts of the electricity undertaking for the year ended March 31st, 1920, records a total revenue of £307,973, as against £245,156 for the previous year. The total expenditure was £174,007, as against £134,707, leaving a gross balance of £133,066, compared with £110,449. Interest charges, loan repayments, &c., amounted to £109,954, as against £111,452, and the net result was therefore a surplus of £23,112, which compared very favourably with last year's deficit of £1,003. A total of 19,770,781 units was sold at an average price of 1·798d. Last year's figures were 16,245,133 and 1·712d. respectively.

Loughborough.—YEAR'S WORKING.—After meeting all interest and sinking fund charges for the year ended March 31st last, the electricity undertaking showed a balance of £1,144—the highest since its inception. The average price per unit sold was 1·95d., and a total of 2,964,096 units was generated.

Manchester.—HOUSE LIGHTING.—The Gas and Electricity Committees are to prepare and submit a joint report as to the system of illumination most desirable for the Corporation's housing scheme.

Nottingham.—ELECTRICITY SCHEME.—An admirable site contiguous to the Trent, and at no great distance from Clifton Colliery, one of the largest undertakings in the immediate neighbourhood of the city, has been acquired for Nottingham's new electricity generating station, but considerable criticism has been already forthcoming locally as to the alleged undue haste with which the report of the responsible Committee dealing with the matter, was presented and adopted, involving as to the first section of the work an expenditure of over £800,000. Mr. A. R. Atkey, M.P., a member of the Corporation, and one of the City's Parliamentary representatives, questions whether the Council was wise in summarily ignoring the offer to supply electricity, which was made by the Notts. and Derbyshire Power Co., possessing statutory powers for the area outside the municipal boundary. He urges that this alternative plan should have received a larger measure of consideration before the Council arrived at its precipitate decision.

Price Increases.—In consequence of additional working expenses, the following towns have adopted increased scales of charges:—Ascot, Barnes, Basingstoke, Batley, Birmingham, Clacton-on-Sea, Darlington, Doncaster, Dublin, Dundee, Fleetwood, Gillingham, Glossop, Godalming, Heywood, High Wycombe, Meeksham, Paisley, Ramsgate, St. Annes, Southend-on-Sea, Taunton, Warrington, Whitehaven, Wolverhampton and Worksop.

Wallasey.—EXTENSIONS.—To meet immediate demands, Wallasey Corporation has decided to lay a high-tension main to New Brighton, with the necessary transformer and switchgear at a total cost of £2,728. The Corporation has taken into account the anticipated load for the next five years. A rebate of ¼d. per unit is to be allowed consumers from the June quarter bills, as defined by the Coal (Pit's Mouth) Prices Order, 1919, in respect of energy consumed for the whole period from December 1st, 1919, to May 12th, 1920.

Worksop.—EXTENSION OF SUPPLY.—Considerable extension of the existing system of electricity supply was decided upon at the last meeting of the Worksop Urban District Council, the estimated cost being over £50,000. The original lighting scheme entailed an expenditure of £37,000, of which £26,000 has been repaid. The Committee had had two schemes under consideration, one for taking energy from Manton Colliery and the other involving an extension of the Council's own plant, the Committee being favourable to the first-named plan. One of the items of £17,830 included in the estimate would only be spent, it was explained, when necessary, and extensions would not be undertaken unless there was guarantee of an adequate return.

Yeovil.—ELECTRIC LIGHTING ORDER.—Messrs. Petters, Ltd., have informed the Town Council that it is not their intention to carry out the Electric Lighting Order they obtained in 1914, and asked if the Council would consider taking on the rights. The Council has declined the offer.

TRAMWAY AND RAILWAY NOTES.

Ayr.—FARE INCREASE.—The raising of additional revenue from the tramways has been under the consideration of the Town Council. The deficit of £3,227 last year was taken from the reserve fund, reducing the latter to £1,772. The estimated deficiency for the year ended May 15th, 1921, is £5,617. It was decided to adopt certain recommendations of the Tramways Committee permitting increases in the fares, discontinuing privilege and permit tickets, and readjusting workmen's fares. By these means it is estimated an extra income of £4,867 will be obtained.

Belfast.—FARE REVISION.—The question of revision of fares and stages was on the agenda at a meeting of the Corporation Tramways Committee, last week, and was adjourned for further consideration. Mr. J. Johnstone, of the National Amalgamated Union of Labour, and Mr. John Malcolm, of the Municipal Employés Association, appeared before the Committee in support of an application for an advance of 1½d. per hour on the basic rates for motormen, conductors, and the depôt staffs. After some discussion the matter was adjourned pending a report from the general manager.

Bolton.—WAGES.—Following the action of the Corporation Tramways Committee in refusing the tramway men double pay for the four days of the Royal Lancashire Agricultural Show, the employés have asked the Committee to reconsider its decision, and to receive a deputation. The men are also applying for an alteration in the basic rates of pay.

Continental.—ITALY.—RAILWAY ELECTRIFICATION.—Steps are being taken by the Italian Ministry of Public Works for the electrification of the Ligurian and Piedmontese railways, including the Genoa-Turin-Modane line, the Union of Central and Northern Italian railways, the Rome to Naples and Sulmona and other Southern lines. Similar operations will be carried out on the Brenner Pass and the Florence to Bologna and Faience lines. It is estimated that altogether 1,400 km. of railway lines will be electrified at a cost of 800 million lire.—*Economic Review.*

Darlington.—EXTENSIONS DEFERRED.—Consideration of the proposal to lay a tramway track from Market Place to the Victoria Road entrance to Bank Top Station, at an estimated cost of £15,000, has been deferred.

Gateshead-on-Tyne.—TRAMWAY DEFICIENCIES.—At a meeting of the Town Council on June 16th, a letter was read from the Ministry of Transport with reference to complaints regarding the tramway services in Gateshead. The Director-General of Traffic wrote that on the information which had been obtained and which had been laid before him, the Minister of Transport was satisfied that the Gateshead and District Tramways Co. was honestly endeavouring to cope with post-war conditions, having, as was natural, due regard to the interests of the undertaking. There appeared to be no sovereign remedy for the conditions to be

Digitized by Google

immediately applied by either the company, the Corporation, or the Ministry of Transport. It was considered, however, that the action which the company had agreed to take was calculated to improve the situation as quickly as was practicable. The Minister suggested the following action by the Corporation, which he thought would contribute to this end :—

1. Co-operation with the tramway company in keeping the loading of cars within reasonable limits, and stopping the practice of travelling on platforms, steps and buffers.

2. Keeping the company advised of any specific requirements, and particularly definite cases of shortage of accommodation.

3. Further consideration, as an important means of relieving congestion under the circumstances, of the question of admitting to the borough, 'buses bringing passengers in from the surrounding d strict.

4. Consideration whether it was possible to take any steps to spread the "peak" load over a longer period.

5. If possible, removal of the cab rank from Wellington Street to one of the adjacent streets.

Huddersfield.—Car Building.—The Tramways Committee has decided that as soon as possible cars will be constructed by the Department.

Leeds.—Wages.—Leeds tramwaymen are to receive £2,000 in retrospective advances in wages from March 29th last. Motormen now receive £3 18s. for a week of 48 hours, compared with £1 18s. 6d. for a week of 60 hours before the war, and conductors get £3 14s., as against £1 13s. 6d.—*Financial Times.*

Accident.—One of the Corporation's trackless cars travelling from Guiseley to Otley, on June 14th, crashed into a wall on the roadside at Menston. The driver was badly shaken, and received cuts on the hand from the broken glass, but the 16 passengers escaped injury. The front of the car was wrecked. It is thought that something went wrong with the steering gear.

London.—L.C.C. Motor-'Bus Scheme.—Having been compelled to withdraw the clauses of the L.C.C. (Tramways and Improvements) Bill, providing for extensions to tramways, the L.C.C. has asked for powers to provide a subsidiary omnibus system at a cost of £400,000. The object is to link up the termini of the tramway system, and to serve new housing schemes, &c. Mr. Vesey Knox, K.C., on behalf of the County Council, said that the refusal of the local authorities to permit the laying of new lines in their districts had given the L.G.O. Co. an opportunity to raise its rates in these localities, thus enabling it to compete with the cheaper tramways in other parts. Mr. G. H. Hume, answering Mr. Freeman, K.C., who appeared for a number of London authorities, and Mr. Honoratus Lloyd, K.C., for the L.G.O. Co., denied that the idea of the scheme was to run in opposition to existing omnibus services, although he admitted that the Bill as drafted would enable the Council to do this. Mr. Hume also deprecated the suggestion that the Council wished to be authorised to run an omnibus service before the setting up of a traffic authority.

London.—Fare Increase.—Acting on the authority of the Ministry of Transport, the Metropolitan Electric Tramways raised the fares on their system on June 22nd. The new scale of charges is :—Two stages for 1½d. (minimum fare): three stages for 2d. ; five stages for 3d. ; and for each additional two stages, 1d. Some of the new fa es are :—Golders Green - Barnet, 6d., instead of 5d ; Finsbury Park—Waltham Cross, 10d., instead of 8d. ; Edgware Road—Sudbury, 8d., instead of 6d. Workmen's fares, single fare for return journey. The fares on the omnibuses serving the same districts will be revised on the same scale.

Stopping Places.—Several alterations in stopping places for tramcars and omnibuses at Greenwich, Battersea, Herne Hill, &c., were made on June 16th, upon the recommendation of the Advisory Committee on London Traffic.

Preston.—Additional Plant.—The Tramways Committee has authorised the engineer to obtain tenders for the supply of additional plant at the power station, in view of the increase in the service.

Railless Cars.—Mr. A. H. Wilkinson, Bradford, in a paper at the annual meeting of the Municipal Tramways Association (managers' section), at Birmingham, last week, said he had been favourably impressed with the performances of railless electric vehicles, and could see a brighter future in store for them. Up to the present they had been considered as an auxiliary or adjunct to the main tramway service, but under existing conditions a considerable extension of railless electric transportation appeared very probable.—*Financier.*

West Riding.—Wages Award.—The award which has been made by the Joint Industrial Council to the tramway industry affects the towns in the West Riding area as follows :—Group 1 (3s. per week increase): Leeds, Sheffield, Bradford, Hull and Huddersfield ; Group 2 (2s. per week) : Halifax, Doncaster, York and Barnsley ; Group 3 (1s. per week) : Wakefield, York, Keighley, Rotherham, Mexboro' and Swinton, Dewsbury and Ossett. The award is retrospective from March 29th last, and is in addition to the award of 6s. per week made by the National Council.

Weston-super-Mare.—Time Extension.—The Electric Supply Co., Ltd., has applied to the Ministry of Transport for an extension of time until August 6th, 1922, for completing the tramways under the Order of 1900.

TELEGRAPH AND TELEPHONE NOTES.

Ecuador.—New Wireless Stations. — A wireless station has been erected at Quito by the Société Française Radio Electrique on account of the Government of Ecuador, and similar stations are also being erected at Guayaquil and Esmeraldas. These stations are of 10 kw.

A Presidential Decree was published in the "Registro Oficial" of March 13th, prohibiting all private parties from importing and establishing wireless apparatus in the Republic.—*Board of Trade Journal.*

Finland.—Telephone Extension.—The South Finland Inter-Urban Telephone Co. proposes to extend its network of lines over another 1,000 km., which will involve an expenditure of F.Mk.3 mill. With this end in view, the capital will be increased from F.Mk.5 to 7 mill.

French Colonies.—New Wireless Stations.—The *J. de Marine Marchande* (May 20th) gives an account of the wireless telegraphy stations in course of construction in the French Colonies.

In 1917 it was decided that the military colonial wireless system should include powerful stations at Saida, in Southern Algeria, Bamako, in French West Africa, Brazzaville, in French Equatorial Africa, Antananarivo, in Madagascar, and Saigon, in Cochin China. The construction of the four latter stations has reached the following stages :—

Bamako : The buildings are nearly finished ; a great deal of the material is already to hand or in place, and the electrical fittings will be forwarded in June.

Brazzaville : The buildings are started, the yards having been opened in December, 1919 ; the plans for the establishment of a hydro-electrical works are drawn up.

Antananarivo : A site for the station has been definitely fixed ; a contract for the supply of electrical energy has been drawn up ; the electrical fittings will arrive at the end of the year.

Saigon : The buildings are nearly finished ; the contract for the supply of electrical energy is signed ; the material will be delivered at the beginning of 1921.

These four large stations, planned for military purposes, will be transferred, when finished, to the Administration of the Postes, Télégraphes et Téléphones. Smaller stations, established by the colonies themselves, and intended for communication in West Africa between neighbouring colonies or between certain centres in the same colony, will be at Port-Etienne, Dakar and Rufisque in the Senegal, Monrovia in Liberia, Conakry in Guinea, Tabou on the Ivory Coast, Bamako—a small temporary station—and Kabara. —*Economic Review.*

Telephone Service.—Deficit.—The Postmaster-General announces that a deficit of £1,750,000 is expected as a result of working for 1919-20. This allows for the payment of interest on capital to the extent of £880,000.

Select Committee.—The Government has decided to ask the House of Commons to appoint a Select Committee to examine the present charges made to the public for the use of the telephone service and to report in what respect these charges require revision, in order to place the service on a remunerative basis. The proposal is that the Committee should consist of Sir Edward Coates, Sir Harry Brittain, Mr. Archdale, Sir Hamilton Benn, Mr. Briant, Mr. Tyson Wilson, Mr. John Robertson, Mr. Carr, and Mr. Purchase.—*The Times.*

Wireless Operators' Strike.—Developments. — *The Times* states that the Association of Wireless Telegraphists has announced its agreement to negotiate on the wages question, but will not advise the men to resume work while negotiations are in progress. The suspension of the order that vessels of 1,600 tons and above must have wireless installations and operators, has resulted in one or two cases in the refusal of crews to sail, causing inconvenience to passengers. The Joint Seafarers' Council has not "recognised" the strike, and other seamen are, therefore, "permitting" the employment of non-Union operators.

CONTRACTS OPEN AND CLOSED.

(The date given in parentheses at the end of the paragraph indicates the issue of the Electrical Review, *in which the "Official Notice" appeared.*

OPEN.

Australia.—Sydney.—August 4th. N.S.W. Government Railways and Tramways. Two 1,000-kw. sub-station units. Chief Electrical Engineer, 61, Hunter Street, Sydney.

August 3rd. Department of Public Works. Turbines and generators for the Barren Jack hydro-electric development scheme. Department of Public Works, Sydney.

N.S.W.—Postmaster-General's Department. August 2nd and 5th. Aluminium sheet, brass rod, &c., scheduled 769 ; platinum wire, gold and silver wire, scheduled 768. (June 11th.)

Western Australia. — Postmaster-General's Department. August 3rd. 326 accumulators, schedule 668. (June 11th.)

Digitized by Google

Belgium.—June 26th. Municipal authorities of Bierset (Province of Liége). Tenders for the concession for supply of electrical energy for lighting and power purposes in the town.

Colne.—Electricity Department. Steam and water piping. (June 11th.)

Darlington.—July 16th. Electricity Department. One 5,000-KW. turbo-alternator and surface-condensing plant. (See this issue.)

Dartford.—June 26th. Electricity undertaking. Rotary converter, transformers, switchgear, &c., L.T. twin cable-feeder, pillar and feeder-panel. (June 11th.)

Edinburgh.—July 13th. Corporation. Electric lighting installations of houses at Gorgie. The Town Clerk.

Glasgow.—July 6th. Tramways Department. One 10,000-KW. steam turbo-alternator, with condensing plant. (June 18th.)

Huddersfield.—Electricians' work in girls' high school, Greenhead. H. Sutcliffe, Borough Architect, 1, Peel Street.

Hull.—July 12th. Electricity Department. One three-motor electrically-operated overhead travelling crane. (See this issue.)

Hoylake and West Kirby.—Coal for a year, for the Urban District Council Electricity Works. Electrical Engineer, Carr Lane, Hoylake.

Middlesbrough. — Corporation. Electric lamps and general stores. Town Clerk.

New Zealand.—AUCKLAND.—September 1st. Harbour Board. For the supply of electric capstans and spares. Messrs. W. & A. McArthur, Ltd., 18-19, Silk Street, Cripplegate, London.

Newport.—June 26th. Electricity Department. Turbo-alternating plant, surface-condensing plant, boilers, economisers, draught plant, steel flue and stack, &c. (June 4th.)

Nuneaton. — June 30th. Electricity Department. 1,000-KW., D.C., geared turbo-alternator, surface-condensing plant and pipework. (June 4th.)

Southampton. — July 3rd. Electricity Department. E.H.T. and H.T. switchgear and D.C. control panel. (June 4th.)

Swindon.—June 26th. Electricity Department. 2,000 yards 3-in. four-way stoneware conduits, light steel poles for overhead lines. (June 11th.)

Warrington. — June 29th. Electricity Department. Truck type ash elevator and hopper. (June 11th.)
July 13th. Electricity and Tramways Committee. Two 6,000-KW. turbo-alternators. (June 18th.)

CLOSED.

Belgium.—The municipal authorities of Horion-Hozemont (Province of Liége) recently invited tenders for the concession for the supply of electrical energy for lighting and power purposes in the town. Not a single offer was received.

Burnley.—The Electricity Committee recommends that the contract for the extensions, at the electricity works, be placed with the English Electric Co., Ltd., the total amount of their tender being £107,400.

Mansfield.—Town Council :—
Cables.—Western Electric Co., £9,888.

Southend-on-Sea.—Town Council :—
600 tubes and 300 bends for condenser.—Ledward & Beckett, £4,575.

Swansea.—Corporation. Accepted :—
British Thomson-Houston Co., Ltd.—Turbo-alternator, complete with condenser, £45,660.

Worcester.—Town Council :—
Messrs. Ward.—Electric bells for police cells, £13; electric fan, £49.

FORTHCOMING EVENTS.

Institution of Electrical Engineers. — Wednesday, June 30th. At the Institution of Mechanical Engineers, Storey's Gate, S.W. At 6 p.m. Paper on "Overhead and Live Rail Conductor Systems," by Sir Philip Dawson.
Thursday, July 1st. At the Natural History Museum, Cromwell Road, South Kensington. From 8 p.m. to 11 p.m. Annual conversazione.

Junior Institution of Engineers.—Wednesday, June 30th. At the Café Monico, Piccadilly Circus. 6.30 p.m. for 7 p.m. Dinner to celebrate 36th anniversary.

Tramways and Light Railways Association. — Friday, July 2nd. At Caxton Hall, Westminster, S.W. At 2.30 p.m. Annual congress. At 7.30 p.m. at the Connaught Rooms: Annual dinner.

NOTES.

The I.M.E.A. Meeting.—Continuing the report of the I.M.E.A. Convention, appearing on page 803, the proceedings were resumed on Wednesday morning. The paper by Mr. I. V. Robinson, Wh.Sc., of the B.E.A.M.A., on "Power Station Design in Relation to Thermal Efficiency," was discussed by Messrs. Carnegie, Selvey, Ferranti, Wilkinson, Swallow, Ayton, Lea, and Hunter. Mr. Robinson replied. In the afternoon an excursion to Bolton Abbey took place, also a golf handicap. Mr. Robinson's paper was contributed as the result of an invitation to the B.E.A.M.A. to give the views of manufacturers. Copies of the specifications and tests agreed between the B.E.A.M.A. and the Association were circulated at the meeting.

Industrial Research.—The Department of Scientific and Industrial Research has approved the Research Association for the British Motor Cycle and Cycle Car Industry. The Secretary of the Committee engaged in the establishment of this Association is Major H. R. Watling, "The Towers," Warwick Road, Coventry.

Vulcanised Rubber.—A new vulcanising process has been invented by Mr. S. J. Peachey, of the Manchester College of Technology. It is stated that instead of the usual high temperatures, the new method employs sulphuretted hydrogen and sulphur dioxide at ordinary temperatures. The process will enable a large class of materials to be treated, which could not be used previously on account of the high temperature involved.

Electricity on South African Farms.—None can doubt the complete present supremacy of the oil engine as a power motor on South African farms, withthe wind motor—invariably of foreign manufacture owing to the strange indifference of British makers—a good second. Nevertheless, there are signs that these will soon be faced with a growing competition from small and self-contained electrical plant. Attention is just now being vigorously drawn to the waste of water power in the numerous districts where it is available, and useful attempts are being made to educate the agriculturist as to the possibilities open in this direction. The common impression has hitherto been that a greater and more forceful flow is required than can be continuously relied upon from the average small stream, and the farmer has yet to learn how small and irregular a flow will give a sufficient horse-power to work a plant capable of driving big farm and dairy machines, and also lighting a homestead. Little or no conception exists of the high peak loads obtainable by the use of the storage battery on a low, but more or less continuous, rate of feed. As information on this subject spreads, we foresee a widely-extended demand for small electricity-generating plant in the farming districts of every part of South Africa.

The subject is one which may well engage the practical attention of machinery importing firms, which should be assured of the sympathetic co operation and support of Home manufacturers of the type of plant referred to. The South African farmer was never before so prosperous or in such a good position to spend money on new ideas and developments. All that is needed is a certain amount of propaganda, both by advertising and personal advice, and he will see the important economies and facilities he can effect by utilising the power now generally running to waste. With a stream 10 ft. wide, from 2 ft. to 4 ft. deep, and with about 5 ft. head, the farmer has a free supply of something like 20 H.P., but the trouble is that in few cases does he know this. The opportunity open to machinery firms strikes us as an extremely valuable one, the more so because the commercial opportunities are not limited to the handling of small dynamos and the necessary material, but the door is opened to a new and highly-profitable business in lighting fittings and such domestic conveniences as electric fans, irons, washing machines, and cooking and heating apparatus. Such plants are not unknown in South Africa. Isolated cases exist where enterprising farmers have had them in successful operation for some years. Such cases are certain to multiply, and the commercial opportunities involved will be recognised and fostered by wide-awake firms. In fact, one such house in British East Africa, holding an American agency, has been making a big push lately with electric motors adapted for agricultural purposes, and, we believe, with considerable success. South Africa should provide a still larger field if similar propaganda were pursued in districts offering the necessary water-power facilities, and, in spite of popular misconceptions, it should be realised that there are few which do not.—*B. and S.A. Export Gazette.*

U.S.A. Production of Electric Power and Fuel Consumption.—Data collected and compiled by the Committee on Division of Power Resources, United States Geological Survey, giving the production of electric power and consumption of fuel by public utility plant in the United States for the month of January, 1920, show an increase of approximately 15 per cent. over the figure for the same month in 1919. The figures for January are based on returns received from about 2,800 power plant of 100-KW. capacity or more engaged in public service, including central stations, electric railways and certain other plant which contribute to the public supply. The capacity of plant submitting reports of operations is about 90 per cent. of the capacity of all plant. The average daily production of electricity during January was 124,300,000 KW.-hours, 33 per cent. of which was produced by water power. The total production of electricity by public-utility plant during 1919 was 40·3 billion KW.-hours, 14·76 billion KW.-hours, or 36·6 per cent. by water power, and 25·54 billion KW.-hours,

Digitized by Google

or 63·4 per cent. by fuels. The mean daily output for 1919 was 110·4 million KW.-hours. The mean daily production for January, 1919, was about 108 million KW.-hours; the mean for January, 1920, was 124·3 million KW.-hours. The value for January, 1919, is estimated. The fuel consumption for the year was as follows:—35 million short tons of coal, 11·05 million barrels of oil, and 21·7 million M. cb. ft. of gas. Converting the oil and gas consumed to coal, the equivalent coal for all fuels consumed during 1919 would be 38·347 million tons. With 25·540 billion KW.-hours, produced by fuels in 1919, an average of practically 3 lb. of coal was required per KW.-hour of electricity produced. On this basis it would have required the consumption of 22,140,000 tons to have generated the KW.-hours produced by water power. The estimated production of bituminous coal in 1919 is 458,063,000 short tons. The amount of coal used by electric public utility plant during 1919 was 7·6 per cent. of the total produced.—*Power.*

Charges for Electricity Supply and Wages of Employes.—The following is a copy of a letter addressed to the secretaries of the Home Counties (No. 9 area) Joint Industrial Council for the Electricity Supply Industry, by the Ministry of Transport:—

COPY.

Ministry of Transport,
Secretarial and Legal Department,
6, Whitehall Gardens, S.W. 1.
June 14th, 1920.

GENTLEMEN,

I am directed by the Minister of Transport to refer to Mr. Webb's letter of the 13th ult., and to the copy of the resolution passed by the Home Counties Council on May 12th, 1920, and also to the conference which Sir John Snell had with a deputation from the Industrial Council on the 19th ult.

The Minister has decided that companies seeking an increase in their maximum rates of charge may now make application to him under section 32 of the Electric Lighting (Clauses) Act, 1899, instead of under the Statutory Undertakings (Temporary Increase of Charges) Act, 1918. This will enable all companies with very few exceptions to make application should that course be necessary. The few exceptions are those companies whose orders were granted to local authorities prior to the passing of the 1899 Clauses Act, and subsequently transferred to the companies.

Such companies and local authorities to whom Section 32 of the Act of 1899 does not apply may make application under the Statutory Undertakings (Temporary Increase of Charges) Act, 1918.

The Commissioners will conduct any inquiries that may be necessary, and they will be always willing to hear any representations which the Industrial Council for the district may desire to make, and the Industrial Council for the district will be notified when any application for an increase of charges is made.

With regard to the second point raised by the deputation, I am to say that the Minister has no power to allocate to any particular purpose any part of the sum produced by the sanctioned increase of maximum charge, but representatives of the Industrial Council can attend any inquiry and be heard thereat.

As regards the third point raised by the deputation, I am to state that the Minister is advised that he cannot restrict the grant of an increase only to undertakers who agree to carry out the recommendations of the Industrial Council.

I am, Gentlemen,
Your obedient servant,
(Signed) R. FRANCIS DUNNELL.

The Joint Secretaries,
Home Counties (No. 9 Area) Joint Industrial Council
for the Electricity Supply Industry.

The Costs of Gas Fittings.—The electrical engineer, with characteristic modesty, and a lively remembrance of the time when new houses were fitted for gas with a mixture of small iron and compo pipes held up for the most part by the plaster, is apt to assume that his wiring estimates are still much in advance of the expenditure called for by his competitors. Only a few years ago small houses were wired in carcass for 8s. to 10s. a point, without fittings, and gas could be run for half that amount. To-day, however, it would appear that high cost of installation and of apparatus is a more serious difficulty to the gas engineer than to ourselves, checking the popular wiring schemes and radically altering the relation between the cost of gas apparatus and the revenue to be derived from its use. A correspondent of the *Gas Journal* recently complained that a speaker had given a figure of £1 per point as the present cost of simple gas installation work, including inverted pendants, burners, outlets for fires, cooker, &c., at the same time stating that the lowest tender known to him for electric wiring without fittings was 25s. per point; whereas the correspondent considered that it could not be done with material up over 100 per cent.; wages of gas fitter 1s. 9d. per hour; wages of gas fitter mate 1s. per hour. The results were given of two houses piped in carcass to determine the costs for 600, as follows:—

Houses: 3 bedrooms, parlour, living room, scullery, bathroom, usual offices.

Points: 10 lighting, 1 cooker, 1 hot water, 4 fires; total, 16.

Net cost without establishment charges, supervision, use of tools or waste, £12 6s. per house.

FITTINGS.	£	s.	d.
1 2-light pendant		14	6
2 Burners at 5s. 4d.		10	8
8 1-light pendants at 5s. 6d.	2	4	0
8 Burners at 4s. 8d.	1	17	4
10 Mantles at 6d.		5	0
10 Patteresses at 6d., labour, &c.		5	0
	£5	16	6

or a total of over £18 actual net cost for a house with 16 points, only the lighting points being completed with fittings. It would appear that after providing the cooker, water heater, and fires, an expenditure approaching £50 per house might be anticipated.

The Fiat Motor-car Works.—When the Italian automobile industry is under consideration, Italy's lack of coal is often cited as one of the handicaps which will prevent the industry attaining the same development as that of other nations more favourably situated in this respect, but Italy has been so favoured by nature in the matter of water power that coal can almost be dispensed with. There is proof of this in the Fiat motor works, which, whilst being one of the largest in Europe, are also completely electrified, the whole of the electrcity being obtained from water power in the Alps. At the present time no coal whatsoever is used for driving machinery. For power and light the big works of the Fiat Company consume 15,000 KW. daily, out of a total consumption of 50,000 KW. for the whole of the city of Turin. When the new steel works and the forges were laid out, they were designed to be operated entirely by electricity secured from water power; the electric furnaces, in particular, are very fine. The essential features of these furnaces are the subject of a Fiat patent, and excellent results are obtained. It was in 1917, soon after the Fiat Company had bought up the Piemontaise steel works and forges, that the problem was tackled of securing sufficient hydraulic power and designing such a plant that no coal whatsoever would be required in the big Turin factory. Control was obtained of the Mont Cenis Hydraulic Power Co., which, by reason of its topographical and geological conditions, offered good possibilities for obtaining electricity. The plant existing at that time on the Cenischia River was able to supply 65,000,000 KW.-hours, of which 38,000,000 were available in summer and 27,000,000 during the winter months. This quantity will be considerably increased in the near future, for extensive works are being carried out on the Cenischia River. In addition to this, by increasing the size of the natural lake on the top of the Mont Cenis, the power available will be increased to 200,000,000 KW.-hours, of which a large portion will be available during the winter months. When these extensions have been completed, the whole of the electricity produced by the Mont Cenis Electric Power Co. will be reserved for the Fiat motor works at Turin.

Electro-deposition of Iron.—In a paper recently read before the Institution of Automobile Engineers, Mr. B. H. Thomas gave an interesting account of the progress of repairing or building up worn motor parts by means of electrically deposited iron. Ball race housings, stub axles, and the various other parts that, subject to continuous wear, become slack must, under ordinary circumstances, either be allowed to run on to the detriment of the engine in general or on the other hand must be replaced—a costly alternative. In such cases the only satisfactory remedy is the deposition of copper or iron, and it has been found possible to coat with a layer 2 mm. thick any cylindrical wrought iron or steel surface. Properly done this layer cannot be chipped off with a chisel, and when carbonised and hardened the dividing line, shown by micro-photographs, entirely disappears. The surface can be filed or ground and given a high finish. At the Third Heavy Repair Shop, described by the writer, 6,000 parts were rendered serviceable by this method in less than two years, and several examples of the various types of work are given in the paper. The plant consisted of two depositing benches with 24 depositing vats each and a large vat for simple repetition work; machine tools for finishing off repairs; two electrolytic cleaning vats; a set of accumulators coupled in groups for 2, 4, 8 and 12 volts; three ¼ H.P. motors for rocking anodes, besides other necessary smaller appliances. The method of working is detailed by Mr. Thomas. The importance of properly cleaning the material is emphasised by the fact that it is put through seven stages, including two electrolytic baths. Any portion of the work to be left as it stands is then stopped off by means of wax or a similar composition. The bath that gave the most satisfactory results was composed of 75 grammes of ferrous ammonium sulphate to 1 litre of water, with a current density of 1 amp. per 30 sq. cm. The work is suspended in the vat from a standard fixed to the bench, and in order to ensure a uniform deposit the anode is moved about the work by means of a small motor. The best anode proved to be that made up of 16 S.W.G. Swedish iron wire wound into the form of a cylinder and thoroughly annealed. The temperature of the solution should be kept above 68 deg. F., and it is desirable to decant and settle it every three days or so to remove oxides of foreign matter which cause roughness in the deposited metal.

The Cracking of H.T. Insulators.—A writer in *Elektrotechnik und Maschinenbau*, discussing this question, points out that cracking in petticoat H.T. insulators is nearly always caused by the cement used in cementing the different parts together (he is, of course, speaking of built-up insulators). Most ordinary cements become very hard with time, and having a different thermal expansion to the porcelain used, they cause the latter to become mechanically stressed, and so cause cracking and breaking when the insulators are heated up. A number of firms use an elastic compound between the cement and the porcelain, but here also the same trouble is experienced with the lapse of time, as the elastic medium also oxidises and hardens. The remedy suggested by this article is to add to the cement (only the best Portland cement should be used) materials having a lower thermal expansion than the cement, so that the thermal expansion of the compound is reduced to approximately the same value as that of the porcelain. A compound of this type, termed "Teleo" cement, has been patented by the Porzellanfabrik Freibergi. S., and has given very satisfactory results in use. It has also a higher mechanical strength than pure cement.

E.P.E.A. Bonus of £30.—We understand that a situation of serious concern to the inhabitants of Derby, Nottingham, and Leicester was recently created by the Councils in these boroughs on account of their not agreeing to pay the above bonus in accordance with the recommendation of the National Joint Board of Employers and members of staff (Electricity Supply Industry). The members concerned, supported by the E.P.E.A., had intimated their intention of withdrawing their services on Friday last, if the Councils did not reconsider their decision and agree to pay the bonus as recommended. We are glad to state that the Corporations have since reconsidered the matter and have decided to pay the bonus to the technical staffs, as from January 1st, 1920.

Appointments Vacant.—Armature winder, for the Oldham Corporation Tramways; foreman (Rs. 500 per week), for the Ammunition Power House, Kerkee, India; meter superintendent (105s.), for the Loughborough Corporation Electricity Department; mechanical and electrical engineer, for the Yorkshire Electrical Power Co.; resident electrical engineer (£450) for the Borough of Wrexham Electricity Department; mains and meter assistant for Alloa Town Council Electricity Department. See our advertisement pages to-day.

INSTITUTION NOTES.

Institution of Electrical Engineers.—There was a good attendance of members on June 16th, when Sir Dugald Clerk, K.B.E., &c., read his "Note on the Thermal Efficiency of the Generation and Use of Gas and Electricity." The subsequent discussion, which will appear in a later issue of the ELECTRICAL REVIEW, raised points of great importance. Among the speakers were Messrs. Merz Highfield, Patchell and Wordingham, Colonel Crompton, and Profs. Cobb and Smithells.

STUDENTS' SECTION.—The London Students' Section of the Institution is to visit Scotland this summer from July 24th to 31st. An attractive programme has been arranged, which will include social functions and visits to power stations, works, and other places of interest at Glasgow and Clydebank.

Institution of Civil Engineers.—A conversazione is to be held at the Institution, Great George Street, S.W., on Tuesday, July 6th, from 8.30 p.m. to 11 p.m.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW *posted as to their movements.*

MR. OSWALD G. COOK, late assistant electrical engineer at H.M. power station, Ripon, has been appointed a director of Messrs. Arthur Cook, Ltd., hauling contractors, Leeds.

The Council of the Royal Society of Arts has awarded medals for the following papers read during the session 1919-20:—MR. SYDNEY PRESTON, C.I.E., "English Canals and Inland Waterways"; SIR JAMES CURRIE, K.B.E., C.M.G., "Industrial Training."

MR. A. E. FIRTH, of the Camp power station at Ripon, has been appointed shift engineer at the York electricity works.

MR. J. ALLAN WILSON has resigned his position as branch manager of Messrs. Johnson & Phillips's Glasgow office, as from June 30th.

The Highways Committee of the London County Council recommends that MR. J. R. WALKER, assistant power-station engineer in the tramways department, be appointed inspecting engineer, at a salary of £440 a year, plus war bonus of 20 per cent., plus £120, making £648.

The marriage took place at Tunbridge Wells, on June 14th, of MR. FRANK ABBOTT, of the staff of the General Electric Co., Ltd., and Miss B. K. Maxwell, daughter of the late Mr. W. Maxwell, of London and Chicago. From his colleagues, Mr. Abbott received a silver coffee service.

Ayr Town Council has granted the electrical engineer a bonus of £150, and the tramway manager a bonus of £135, into which all war bonuses are merged.

MR. W. C. MALLINS, general manager of the Liverpool Corporation tramways, was presented on his retirement with a silver rose bowl, salver, and vases, at a luncheon given by the chairman of the Tramways Committee (Councillor F. C. Wilson), at the London and North-Western Hotel, Liverpool. Warm tributes were paid to his work as tramway manager.

Kilmarnock Town Council has appointed MR. J. H. MENZIES, of Dundee, as tramway manager.

Obituary.—MR. CECIL TREHERNE, who was killed by lightning on June 12th, was an apprentice to electrical engineering with the British Westinghouse Co., at Manchester, and was about to enter Manchester University to take an engineering degree. He was 19 years of age.

MR. T. GOODYEAR.—The death has taken place of Mr. Thomas Goodyear, who was for over 24 years electrical engineer to the late Lord Nunburnholme, at Warter Priory (Yorks.). He was 63 years of age.

MR. JOHN COOPER.—We regret to record the death of Mr. John Cooper, accountant, who was in the employ of the Edison Swan Electric Co., Ltd., for 30 years.

Will.—Mr. H. P. SMALLPEICE, chairman of the Guildford Electricity Supply Co., Ltd., left £138,265 gross and £114,424 net personalty.

NEW COMPANIES REGISTERED.

Greenling Electric Supplies, Ltd. (168,255).—Private company. Registered June 14th. Capital, £5,000 in £1 shares (4,000 participating preferred). To carry on the business of electrical, mechanical, motor and general engineers, manufacturers of and dealers in transformers, radiators, dynamos, motors, &c. The subscribers (each with one share) are: W. H. Roslington, 15, Duke's Avenue, Chiswick, W.4, merchant; H. W. Humphries, 23, King Street, Cheapside, E.C., C.A. The first directors are: W. H. Roslington (governing director) and others to be appointed by him. Solicitor: E. J. B. Hobrow, 9, Ironmonger Lane, E.C.

Garner, Holt & Co., Ltd. (168,355).—Private company. Registered June 17th. Capital, £5,000 in £1 shares. To take over the business of an electrical engineer and constructor carried on by G. Garner at 2, Grange Terrace, Wilmslow Road, Rusholme, Manchester, as "Garner, Yates & Co." The permanent directors are: G. Garner, 2, Grange Terrace, Wilmslow Road, Rusholme, Manchester, electrical engineer; A. O. Holt, 2, Grange Terrace, Wilmslow Road, Rusholme, Manchester, electrical engineer. Solicitor: S. Bishop, 23, Fountain Street, Manchester.

Northern Radiators, Ltd. (168,201).—Private company. Registered June 11th. Capital, £5,000 in £1 shares. To carry on the business of radiator manufacturers, motor, electrical and general engineers, &c. The subscribers (each with one share) are: E. C. Q. Henriques, 477, Bury New Road, Manchester, engineer; K. Howell, 88, Stockport Road, Marple, clerk. The subscribers are to appoint the first directors. Qualification, £100. Secretary: E. C. Q. Henriques. Registered office: Sheepscar Street, Leeds.

Industrial Electroplant, Ltd. (168,192).—Private company. Registered June 11th. Capital, £2,000 in £1 shares. To carry on the business of manufacturers of and dealers in electric and galvanic machinery, motor cars, motor and other cycles, aircraft, range finders, steering gear, gyroscopes, dynamos, cables, switchgear, &c. The subscribers (each with one share) are: F. C. Austin, Thorncroft, Warlingham, Surrey; H. A. Rawlin, 179, St. James' Road, S.E.1. The first directors are: F. Pooley, E. C. Austin, W. L. Wreford, F. Creedy and H. St. Hill Mawdsley. Registered office: 34, Broadway, Westminster, S.W.

Sinclair, Paget & Co., Ltd. (168,209).—Private company. Registered June 11th. Capital, £2,000 in £1 shares. To take over the business of electricians, electrical engineers, &c., carried on by G. F. A. Paul at 8, New Inn Yard, Shoreditch, E.1. The first directors are: W. P. St. John, 151, Fore Street, Edmonton, N.18, accountant; G. F. A. Paul, 32, Falmer Road, Enfield, electrical engineer; L. Lambert, 21, Aldebert Terrace, Clapham, S.W.8, accountant. Secretary: L. Lambert. Registered office: 8, New Inn Yard, Shoreditch, E.1.

Fred Price & Co. (1920), Ltd. (168,229).—Private company. Registered June 12th. Capital, £50,000 in £1 shares. To carry on the business of electrical engineers and contractors, mechanical engineers, &c. The subscribers (each with one share) are: R. Lane, 3-4, Duke Street, Cardiff; F. Price, 9, Gold Street, Cardiff; A. W. Horton, 29-31, St. Mary Street, Cardiff; C. W. King, Pentre Gwylim, Llanishen. The first directors are: Sir Edward Nicholl, Sir Wm. Diamond, R. Lane and C. W. King. Secretary: T. C. Evans. Solicitors: Forsdike, Buchanan and Giles, Cardiff. Registered office: Institute Lane, Park Place, Cardiff.

Bougie Pognon, Ltd. (168,249).—Private company. Registered June 14th. Capital, £100 in £1 shares. To acquire and turn to account the patent and trade mark relating to the Pognon sparking plugs. The subscribers (each with one share) are: A. Peters, 4, Mount Road, Wimbledon Park, S.W.19; A. Keston, Westgrove, 339, Amhurst Road, Stoke Newington, N.16, clerk. The first directors are to be appointed by the subscribers. Solicitor: A. Baker, Lennox House, Norfolk Street, Strand, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Accessories Manufacturing Co., Ltd. (Old Co.).—H. A. McCann, of 8, Queen Street, E.C.4, ceases to act as receiver or manager on June 8th, 1920.

Penrith Electric Supply Co., Ltd.—Satisfaction in full on April 29th, 1920, of mortgage dated December 5th, 1918, securing all moneys due or to become due from the company to bankers.

Kent-Mitchell, Ltd.—Satisfaction to the extent of £1,000 on February 20th, 1920, of debentures dated July 11th, 1919, securing £3,000.

Llanrwst Electricity Supply Co., Ltd.—W. J. Parry, of Caetmor Chambers, Bethesda, Carnarvon, as receiver and manager by order of Court dated May 21st, 1920.

Digitized by Google

P. E. Baker, Ltd.—Particulars of £10,000 debentures created May 19th, 1920, whole amount being now issued, charged on the company's undertaking and property, present and future, including uncalled capital.

Honiton & District Electric Supply Co., Ltd.—£500 debentures dated May 25th, 1920, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: C. Harding, Burwood, Honiton, and others.

Llangollen & District Electric Light & Power Co., Ltd.—Debentures, and as collateral security, a mortgage, both dated May 13th, 1920, to secure £1,000, charged on company's undertaking and property, present and future, and lease of portion of Deel Mills, Llangollen, with powers therein granted to install dynamos and generators, &c. Holders: E. F. Jones, Llangollen, Denbigh.

W. Saunders, Ltd.—Mortgage dated May 20th, 1920, securing £2,200, charged on 24, 26, and 28, Crouch Street, Colchester. Holders: Miss F. Fitchett, Halstead; W. J. Hankin, 3, Winchester Street, Basingstoke; and F. V. Hankin, Ash Cottage, Clarence Road, Fleet, Hants.

Lancashire Dynamo & Motor Co., Ltd. (61,447).—Return dated December 31st, 1919. Capital, £250,000 in £1 shares (200,000 ordinary and 50,000 preferred), 150,000 ordinary and 48,800 preferred shares taken up. £198,800 paid. Mortgages and charges, £75,000.

CITY NOTES.

Lancashire Power Construction Co., Ltd.

As a result of the Parliamentary Co.'s operations for the year 1919 that company has, after paying debenture interest and putting £15,000 to reserve, declared a dividend of 7 per cent. upon its shares, all of which are held by this company. This will produce £35,660, plus £4,500 interest on the debenture held by this company, plus interest, &c., received £1,317, making £41,477. Debenture interest payable, general expenses, &c., absorb £17,219, leaving £24,258, plus £8,441 brought forward. Dividends of 6 per cent., tax free, on the cumulative convertible first preference shares, 7 per cent. on the 7 per cent. cumulative participating preference shares, and 6 per cent. on the ordinary shares, are to be paid, leaving £9,648 to be carried forward. To enable the extension of the generating station and mains of the Parliamentary Co. to be proceeded with, the company in December last made an issue of 400,000 6 per cent. cumulative convertible first preference shares of £1 each. The following figures indicate the development of the Parliamentary Co.'s business during the year:—

	1918.	1919.
Units generated	49,581,893	50,671,536
Maximum load in KW. ...	14,000	18,600
H.P. connected	35,500	39,000
Receipts	£136,745	£173,338
Expenditure	£88,731	£119,960
Profit on trading	£48,014	£53,378

Owing to the change from war to peace conditions, and especially to the reduction in working hours in practically all industries, the Parliamentary Co.'s output has not quite maintained the normal rate of expansion, but in spite of many difficulties the trading result has improved, and the Parliamentary Co. has been able to increase its dividend to this company from 6 to 7 per cent. New contracts entered into during the year, which are now maturing, will have the effect of approximately doubling the company's output as soon as the plant on order is in commission. In addition inquiries have been received considerably in excess of the company's capacity to supply, even when the present extensions are completed. These inquiries are receiving the careful consideration of the board. The continued high price of coal has brought home to power users in every industry the great advantages of central electric power supply. The extensions at the power station, although somewhat behindhand, are now making good progress, and it is hoped that the first of the two 10,000 KW. sets on order will be operating in October, and the second about four months later; labour difficulties, and particularly the moulders' strike, are responsible for the delay in the delivery of the new plant.

Delhi Electric Tramways and Lighting Co., Ltd.

Mr. A. W. Tait, C.B.E., in the course of his speech at the annual meeting, said that the accounts were the most satisfactory since the formation of the company. The position had been strengthened, and the first dividend on the ordinary shares was recommended; the preference shareholders began to get some return in respect of their participating right. They had received considerable assistance to these ends from the profit obtained on remittances to this country (£7,127), an abnormal circumstance, which they could not expect to be repeated to the same extent in the current year. The satisfactory feature of the accounts was the increase in the revenue from both branches of the undertaking. This would have been greater but for the complete boycott of the cars which took place in April, 1919. The net revenue increased by 13 per cent. It was inadvisable to increase the tramway fares, but they were considering slight increases in the lighting and power rates. There had been a slight fall in the cost per unit generated due to an improvement in the freight charges on oil fuel. They were making arrangements to cope with the demand which was expected during the coming winter. There would be an exceptional demand during the visit of the Prince of Wales. Despite the difficulties of obtaining electrical materials of all kinds, 195 consumers were added, against 117 in the previous year. As they had been able to obtain better supplies of materials the new consumers this year showed a further substantial increase. They had selected a type of car which was at present before the municipal authorities for approval. Rolling stock was costly, and there was difficulty in obtaining delivery and accommodation to India, so they might not be able to supplement their rolling stock to any material extent for some time. It was too early to give a reliable estimate of the prospects for the current year, but the returns so far to hand showed that if conditions remained normal they might hope for as good a result as that now submitted so far as the net revenue of the combined undertakings was concerned—leaving out of account the question of exchange. The general manager, Mr. Griffin, was returning to this country for a rest owing to the state of his health. It was improbable that he would be able to return to India for any extended period, and they would have to consider the question of a successor at an early date.

Greenwood and Batley, Ltd.

Col. O. C. Armstrong, D.S.O., presiding at the annual meeting on 15th inst., said that regarding future prospects they need have no anxiety as to orders; they were in the fortunate position of being able to pick and choose their orders, though under existing conditions this was not always an infallible indication of results. The many factors which might intervene between the acceptance and the completion of a contract were at present abnormally indeterminate, and these in turn were aggravated by the crushing effect of prospective taxation. It was confidently anticipated that within eighteen months of the actual conclusion of the war they would all be in a position to reorganise and develop to their fullest extent the industrial powers of this country. Everyone accepted that industry would have to bear its full and direct share in the taxation necessary to liquidate the vast debt that had been incurred, since, carried to its ultimate conclusion, industry, directly or indirectly, in one form or another, would eventually have to find by far the greater part of the money required for the repayment of the war debt. It was, however, generally and justifiably assumed that in course of time a wise and statesmanlike policy would be initiated which would adjust the burden of taxation in such a manner that it would leave the most important factor in this country, the manufacturing industry, the freest possible use of all its powers of development both in the home as well as in foreign markets. So far from this being the case we are apparently to have an extension of the E.P.D. in an aggravated form—an inequitable and deleterious form of taxation admissible at best as a temporary expedient under war conditions, where the Government practically consumed or controlled the entire output of our factories, and mass production of standard articles was more or less universal. The orders already booked were sufficient to keep all the various departments in the works fully employed for the next twelve months, and, given freedom from labour troubles and loyal co-operation of the men, he thought they could look ahead, in so far as the immediate future was concerned, without any cause for anxiety. A very fair proporiton of the orders are for export, and they found many of their old customers from abroad were again asking them to supply their needs.

Callender's Cable and Construction Co., Ltd.

Sir J. Fortescue Flannery, M.P., presided on June 17th at the Hall of the Institute of Journalists over the annual meeting. He said the results were extremely satisfactory, and when it was remembered that they were achieved in the face of unusual difficulties, they were all the more gratifying. The war had made things difficult for the company, but they had had one steady customer in the Government, who had taken the greater part of their output to the great advantage of both the Admiralty and the War Office. As a result of the suspension of hostilities the Government stopped its war orders within 24 hours, and left on the company's hands large quantities of practically manufactured materials, and a factory which had been built to meet its special requirements. Their original factories, as they had been converted again to meet the special requirements of the Government, were to a large extent in a condition unsuitable for commercial work. The problem left to the company, therefore, was to obtain orders sufficient to fill the works, rearrange the factories to make such work profitable, and at the same time in order to keep their promise to re-engage and re-employ over 800 men. These briefly were the conditions under which they began in 1919, and it was testimony to the inherent strength of the company that first its world-wide agencies, secondly, its sales organisation, and last, but not least, the skill and grit of its management, led by Sir Tom Callender, enabled it to secure the orders, deliver the goods, and obtain the profit which was shown in the accounts. The profit was made between January 1st and December 31st, 1919, and so went to the credit of the whole year, but a large part of the year had elapsed before the changes required by the altered conditions of manufacture were completed, and although the factories were turning out cables in large quantities during the whole of 1919, obviously they could not do so efficiently, and consequently profitably until the changes

Digitized by Google

in equipment and organisation were completed. The profit made was, therefore, earned after these changes had been made, and consequently during a portion only of the year under review. The present year was handicapped by no such difficulties, and they expected corresponding improvements in the results. Attention was drawn in the report to the re-arrangement of the factory routine, owing to the working week having been reduced to 47 hours, *i.e.*, by over 10 per cent. The volume of orders recorded was colossal, and quite beyond the capacity of the factories at the present time working for 47 hours a week only, and it was clear that the fullest and most complete employment of the plant must be obtained to achieve the delivery to time of the large contracts for cable which were placed in their hands. Negotiations were opened with the men's unions, and the whole situation explained, reviewed, and discussed, and, after prolonged and difficult negotiations, a scheme of rotary shifts for the cable shops was formulated and agreed, so that the cable works could, to all intents and purposes, keep up a continuous process of manufacture. Such an arrangement enabled them to deal with the extraordinary volume of orders received, and to a limited extent effect some improvement in the cost of manufacture. In this connection, however, the higher rates of pay and the lower efficiency of night work had to be set off against some reduction in general charges per ton of cable manufactured following, as such reduction should follow, upon continuous operation of their plant. All this augured well for the company's future, and forecasted even better results than those shown in the accounts. The volume of orders received after the cessation of hostilities had been prodigious, large contracts had been secured, and others were apparently coming their way, the output of the work was continuously increasing, and, moreover, a new factory had been erected at the Erith works to manufacture super-tension cable for 33,000 to 60,000 volts. Until comparatively recently voltages higher than 11,000 volts were not employed in this country. Now that the supply and application of electricity was increasing so enormously, huge stations were built to distribute current over large areas, higher pressures were employed, and the demand for super-tension cables was already urgent, and was obviously bound to develop. Their employment, however, was not restricted to this country. In every part of the world where electricity was developing the same demand was arising, and as they intended to obtain their share of the orders, they had designed and built a factory especially to manufacture efficiently this class of cable. The factory was now complete, and would commence operations immediately. The prospects of the company as they found them to-day were never more hopeful. The books were full of orders, works were operating efficiently, and the new factory was ready. The network of agents throughout the country and abroad poured into the headquarters a steady stream of inquiries and orders, and the difficulty was not to obtain work, but how to avoid "biting off more than we can chew." The directors intended to seize the opportunity now before them to drive ahead the enterprise for which they were responsible, along the path of even more successful progress. To do so, however, financial resources beyond those already possessed by the company were necessary; and, in a few days' time, the board would appeal to the public to provide them with further funds to develop this successful business towards an even greater financial return. The general terms of the issue were known to them. They were 400,000 7½ per cent. "B" preference shares of £1 each at par, and 100,000 ordinary shares of £1 each at 22s. per share—terms attractive enough, it seemed to them, in themselves to ensure the same great success as occurred in their issue of 1918, which was subscribed nine times over. Supported, however, by the results and the favourable prospects which they had indicated, the new issue should induce shareholders to take a still greater share in the successful enterprise they owned. Touching on the accounts, the chairman said that the balance to the credit of profit and loss account was £161,000, as compared with £134,000 a year ago. After provision for interest on debenture stock, dividend on preference shares, and depreciation, and adding the balance brought from 1918, there was an available total of £198,000, as compared with £184,000 a year ago. They were carrying to special reserve for war taxation £33,000, and after payment of a dividend for the year of 15 per cent. on the ordinary shares, they were carrying forward £105,000. Referring to the reserve for war taxation, he said that the excess profits duty at 60 per cent. was a terrible impost on industry; it must tend to check enterprise, and must cripple industry to a considerable extent. That crippling process affected every company, and this company, of course, did not escape. It was to be hoped that the discussions which were now going on might enable the Government to see their way to some reduction of this very serious taxation.

Sir T. O. Callender (managing director), in seconding the motion, said that 1919 has admittedly been a year of great effort and very hard work, in view of the change of circumstances under which the company had had to operate, and he wished to acknowledge the great help he had received from all the members of the staff during this trying time. In every direction they had endeavoured to push the interests of the company. They had opened up new connections, although they had very large ones already existing before the war, and an interesting item he might mention in this connection was that in the somewhat unlikely country of Ireland they had succeeded in opening up a small but satisfactory business account. They had pushed ahead in South America, where they had opened their own offices on the West Coast with what he hoped would be very satisfactory results. They had widely extended their field of operations in India, and he was confident there would be much business to the good of the company there. The new factory for the manufacture of super-tension cable would relieve the strain on the existing workshops to a considerable extent, and give them an entirely new field of operations. He hoped that before the present month closed they would be actually making this cable in the new shops, and he was sure the results would in every way justify the considerable expenditure incurred. There was still room for improvement in their output. He desired to say, however, that the relations which prevail between the company and their men—especially in their cable shops—were friendly and wholesome, and by the working of the Whitley Council they got into very close touch with each other without the necessity of disputes which had been very unfortunate in some trades, though not in their own, in the past. From all this, and from his knowledge of what was being done, he saw ahead ample work for the company for some time to come, and unless some great disaster occurred to stop all industry throughout the world, he felt sure that the electrical cable manufacturing of which this company stood at the very head, would find during the next three or four years, at any rate, ample scope for all that it could do.

United River Plate Telephone Co., Ltd.

Sir Frederick Green, K.B.E., presided at the annual meeting, last week. He said that the net results, though somewhat less than those of 1918, were decidedly satisfactory considering the position of the world's business everywhere. The earnings in Argentina and London amounted to £976,168, an increase of 7½ per cent. But, on the other hand, maintenance and other expenses of management in Argentina and London increased by 24 per cent., resulting in a profit of £212,092, a decrease of £80,407 as compared with 1918, or 27½ per cent. Negotiations were in progress for obtaining permission to increase their rates, and they had reason to hope that their request might soon be granted. As regards Argentina, the increase in working expenses amounted to £127,097, of which 50½ per cent. was represented by increased operators' wages, 19¼ per cent. by increased cost of plant maintenance, and the balance, 30¼ per cent., by increased cost of administration, taxation, and sundry other items of management. They had to set against this increased expenditure an increase of £66,151 in earnings, making the net decrease for the year in Argentina £60,946. The London expenditure, including income tax, amounted to £105,167—a considerable increase over 1918, but one which was almost entirely due to increased income tax. The addition to the plant account was £148,236, and to real estate £53,733. The latter item was principally due to payments on account of a new building in the city of Buenos Ayres now nearing completion, which would eventually house two 10,000-line exchanges, as well as provide accommodation for a number of the staff. Stocks of material stood at £207,464, nearly double the figure for 1918, and were largely due to heavy shipments during the latter part of 1919 for the purpose of capital extensions. Higher prices, too, played their part in the increased value of this asset. The shortage of materials still prevented them from doing as much renewal work as they desired. At the present moment the waiting list in the city of Buenos Ayres numbered considerably over 5,000, which it would be impossible to reduce to any extent until the additional switchboards (some of which were now in course of erection) were completed. These new switchboards, however, with the exception of one, were merely additions to existing exchanges. To provide the further telephone facilities which were urgently needed, but which during the war years they could not supply, it had been necessary for the company to prepare schemes for altogether new exchanges in other parts of the capital. Accordingly, it had to be decided whether the present Central Battery manual system should be continued for these new exchanges, or whether they should adopt the automatic system which they had had in use for some years in Cordoba and Rosario. Until recently there were difficulties in connection with the introduction of an automatic system into a city where telephone service was already being given by manually-operated exchanges, but these difficulties had now been overcome, and so, after careful consideration, they came to the decision to adopt the automatic system, and had therefore ordered one of the Strowger type, similar, in the main, to that in use at Cordoba and Rosario. It was being manufactured in England, and it was hoped delivery would be made during the early part of next year. This decision to adopt the automatic system for Buenos Ayres would not mean any alteration in the numbers of the present operating staff, as the exchanges in question were entirely new ones; but it should reduce the number of operators necessary for future developments. The Argentine Government had suspended the regulations which since 1912 had seriously retarded telephonic development, and they were now free to proceed with important works which, had it not been for these regulations, would have been completed long ago. Unfortunately, however, the obtaining of the necessary material to-day was very difficult, and this would prevent them from making the rapid progress they desired. These new works, together with the continued expansion of the company's business, would naturally mean a considerable

Digitized by Google

expenditure, and it would be necessary to provide further capital. Though there was no need to make a new issue of shares forthwith, they were asking for sanction to an increased share capital, so that, probably next year, they would be in a position to make an issue. The increase of capital would be from £2,000,000 to £2,500,000.

Marconi International Marine Communication Co., Ltd.

Mr. Godfrey Isaacs, presiding at the annual meeting, on June 18th, said that the year had been a somewhat difficult one in consequenec of the dismantling of a great many ships following the cessation of war and for other reasons. In regard to the statement that was frequently made that their charges were far too high, the public did not understand that they received only 2d. per word of the 10½d. charged; 6½d. went to the Post Office and 2d. to the shipowners. Last year he told them it was probable that an additional source of revenue to the company would arise from the use of the direction finder on board ships. This apparatus had been further improved, and was now becoming a really valuable device in assisting navigation, and would become a serious factor in the protection of life at sea. It had been installed on a number of ships, and they looked forward to it being largely employed. The speaker referred to the strike of wireless operators and the negotiations that had taken place prior to the strike. He said that the demands would cost the company £500,000 per annum, and they could not be conceded without reference to the shipowners.

Marconi's Wireless Telegraph Co., Ltd.

The report for 1919 shows a credit balance of £1,220,740 plus £463,787 brought forward, making £1,684,526. Dividends of 22 per cent. on the preference shares and 25 per cent. on the ordinary, also a bonus of 5s. per share, without deduction of income tax, on the old ordinary and the preference shares will leave £955,202 to be carried forward. The report says:—"There having been no settlement with any of the Government Departments in respect of any of the company's claims arising out of the war or for services rendered during the war, no sum in respect of any of these claims figures in the year's accounts. In consequence of unfavourable rates of exchange which obtained at the end of the year, considerable sums of money have been allowed to remain abroad on deposit or invested in foreign Government securities. A sum approximating £58,000 has been debited to profit and loss account, calculating the rate of exchange on December 31st as though the money had been brought home at that date and the loss incurred. The loss, however, has not been actually incurred, and when in the course of time exchanges improve, as no doubt they will do, the sums written off will figure in a future balance sheet as a profit. Further, a sum of £56,000 has been written off, representing depreciation in investments in British and foreign Government securities. Meeting: June 29th.

Anglo-Argentine Tramways Co., Ltd.

The gross receipts for 1919 were £3,296,957, less expenditure £2,578,516, leaving £718,441, plus interest, &c., £39,521, and £83,043 brought forward, making £841,005. Deduct: Annuity to City of Buenos Ayres Tramways Co. (1904), Ltd., £70,660; debenture interest and sinking funds, £587,821; sinking fund for redemption of preference and ordinary stocks, £7,014. The balance to net revenue was £175,510. The directors recommend a dividend of 5½ per cent. on the cumulative first preference shares, being the arrears for the year to June 30th, 1918, less income tax. This absorbs £123,200, and leaves £52,309 to be carried forward. Traffic receipts increased 6.52 per cent. This would have been considerably augmented but for the interruption of services caused by strikes. Passengers carried 370,734,985, being 21,448,647 in excess of 1918, an increase equal to 6.14 per cent. The operating expenses show an increase of £198,178, due to extra cost of all materials and higher wages, a special expenditure during the strikes of £35,737, and a further addition of £54,670 to renewals reserve. The abnormal price of fuel continued to act adversely upon the cost of working, but the second half of the year showed a slight improvement. After protracted negotiations and full investigation by the municipality, the justice of the company's claim for a revision of tariffs was recognised, and an ordinance was promulgated authorising an increase from 10 to 12 cents to take effect as from April 10th this year. The directors record their appreciation of the manner in which the negotiations were conducted by Mr. Pedriali. Sir George Touche, Bart., has been elected chairman of the company in place of the late Mr. J. B. Concanon. Baron L. Janssen and Count C. Cicogna, who joined the board in 1908, have retired. The vacancies on the board were filled by the election of Monsieur Maurice Despret, President of the Société Financière de Transports et d'Entreprises Industrielles, Brussels, Sir Philip Lloyd-Greame, K.B.E., M.P., and Major J. E. Dunning, D.S.O. Mr. Joseph Pedriali, the general manager in Buenos Ayres since 1909, has also been elected to the board. Lengthy extracts from the report by the general manager accompany the statement. Among other matters covered therein are the conditions under which the ordinance relating to the increased tariff was adopted. There are to be as from April 10th, minimum wages of $4 and $4.50 respectively for labourers and all employés; an 8-hours' working day; an increase of 10 per cent. on all wages over the minimum; contribution of 8 per cent. on wages by company towards pension funds. The increased tariff is for three years, at the end of which it is to be revised. Any extra profits after allowing 8 per cent. on full capital actually invested, to go to the municipality. 30 km. of new track to be constructed by the company within three years; arbitration to be provided in case of labour disputes. Although the new obligations are very heavy, it is anticipated that the new tariff, combined with greatly increased traffic and decreased expense in cost of electricity, will have a favourable effect upon the finances of the company during the present year. In regard to prospects, Mr. Pedriali says:—

> The year 1919 gave proof of how rapidly this country can recover from a critical situation, when it is aided by good harvests, which are the backbone of all business here. When writing my report for 1918, at this time last year, the outlook was not brilliant owing principally to the very grave state of affairs existing as regards Labour, but the professional agitator was side-tracked, with the result that confidence was gradually re-established. We are at the present moment experiencing increases in receipts that are greater than we have had before. It would be practically impossible for this rate of increase to continue during the entire year, but I have no doubt that we shall continue to have big traffics. The shortage of cars which we are now beginning to experience is responsible to a great extent for the very high earnings per car kilometre run, and this will continue through the year.

Prospectuses.—*Callender's Cable & Construction Co., Ltd.*—The list is to close on or before June 26th (to-morrow) in an issue of 400,000 7½ per cent. "B" cumulative preference shares of £1 each at par, and 100,000 ordinary shares of £1 each at 22s. per share. The proceeds of the issue are required for erecting additional workshops at Erith, providing further working capital to cope with the increased turnover of the company and its subsidiary, the Anchor Cable Co. The report of the annual meeting of the company appears in this issue of the REVIEW.

A. Reyrolle & Co., Ltd.—The list of applications for the 160,000 ordinary shares was closed on Saturday last, the amount being over-subscribed.

Stock Exchange Notices.—The Committee has ordered the undermentioned to be officially quoted:—

Marconi International Marine Communication Co., Ltd.—440 shares of £1 each, fully paid (Nos. 1,192,287 to 1,192,726).

Mather & Platt, Ltd.—450,000 ordinary shares of £1 each, fully paid (Nos. 600,001 to 1,050,000).

Dealings in the undermentioned have been specially allowed by the Committee under Temporary Regulation 4 (3):—

Aster Engineering Co. (1913), Ltd.—100,000 eight per cent. cumulative participating preference shares of £1 each, 5s. paid, Nos. 1 to 100,000.

Keith (James) and Blackman Co., Ltd.—40,000 new ordinary shares of £1 each, fully paid, Nos. 160,001 to 200,000; and 80,000 ordinary shares of £1 each, fully paid, Nos. 80,001 to 160,000.

South Wales Electrical Power Distribution Co.—The report for 1919 states that units sold show an increase of 8,534,082. After payment of all expenses, the credit balance of the past year's working was £25,627, which with £2,670 to the credit of suspense account, makes £28,297. Deducting interest on prior lien debenture stock and original debenture stock, and making provision for depreciation of new plant, there remains a balance of £676 to be carried forward.—*Financial Times.*

Eastern Telegraph Co., Ltd.—Dividend at the rate of 3⅓ per cent. per annum, less income tax, on the preference stock for the quarter ended June 30th, and a first quarterly interim dividend of 2½ per cent. on the ordinary stock, free of income tax, in respect of profits for the year ending December 31st, 1920.

Electro-Bleach & By-Products, Ltd.—Profit for 1919 £34,637, plus £394 brought forward. Total dividend on the ordinary shares 14 per cent. for the year. £5,000 to reserve; £4,277 carried forward.

Petters, Ltd.—Ordinary share dividend at the rate of 10 per cent. per annum, free of tax, for the year ended March, 1920. To reserve £8,000; written off expenses of issue of additional capital £5,645; carried forward £20,219.

W. & T. Avery, Ltd.—Further dividend of 10 per cent., making 15 per cent. for the year ended March. To reserve, £20,000; carry forward, £23,003.

Waygood-Otis, Ltd.—Dividend 7½ per cent. on the ordinary shares for the year ended March, 1920. Carry forward, £14,446.

Imperial Tramways Co., Ltd.—Dividend on the ordinary shares 4 per cent., less income tax, £5,600; carried forward £966.

Eastern Extension, Australasia & China Telegraph Co., Ltd.—Interim dividend for the three months ended March 31st last of 5s. per share, free of income tax.

British Electric Traction Co., Ltd.—Net profit for year ended March, 1920, £211,316, against £213,324. Dividend 4 per cent. on the ordinary stock. Carried forward £150,422, as against £130,952 brought in.

Direct Spanish Telegraph Co., Ltd.—Dividend on the ordinary 7 per cent. and a bonus of 3 per cent.; to reserve £5,000; carried forward, subject to excess profits duty £20,328.

Digitized by Google

J. G. White & Co., Ltd.—Dividend on ordinary shares for year ended February, 1920, 7 per cent., less tax. To reserve £30,000; carried forward £15,286.

International Light & Power Co.—Dividend 1½ per cent., less British income tax, on preference shares for the quarter.

Ransomes, Sims & Jefferies, Ltd.—Dividend on the ordinary shares 5 per cent. per annum; carried forward £36,354.

STOCKS AND SHARES.

TUESDAY EVENING.

WITH the approach of the end of the first half-year, the Stock Exchange does not look for any particular increase in the volume of business, and it cannot be said that the House is disappointed. So far as the money market is concerned, New South Wales has broken fresh ground by offering 6½ per cent. stock at 100. This is the highest rate to be paid by such a borrower for a long time past, and cannot fail to have its effect upon investment securities of all kinds. The industrial markets, however, are fairly well maintained, owing to the lurking hope that the 60 per cent. Excess Profits Duty may not be imposed after all, although, seeing how far away we are from the Budget, the more cautious observers are inclined to think that the 60 per cent. will have to stand in respect of the current financial year, and that it will not be lowered until next April.

Something of a feature is the way in which Edison Swan shares have risen from 23s. 9d. to 26s. 3d. Various rumours are afloat to account for the improvement. Of two authorities who were consulted in regard to the rise, one said that there is an amalgamation scheme in the air, while the second one stoutly denied the existence of any such thing. That well-informed people have been buying is, however, indisputable, and a good deal of interest attaches as to what may be the upshot of the present advance. Other electrical manufacturing shares have hardly moved. General Electrics and Siemens, which are being closely watched, remain at 28s. 6d. (for the new shares) and 26s. respectively. Callenders new issue of preference and ordinary is out, and the ordinary shares are being offered at 22s.—not 24s. as it was originally reported that the issue price would be. The prospectus will certainly appeal to those who are connected with the industry, and in ordinary times when investors are ready to take good stock, there would be no doubt in prophesying a signal success for the issue. Sharp recovery has occurred in Home Railway stocks, in the course of which most of the steam issues have gone up from 10s. to 50s. per cent. Up to the present, however, the Undergrounds have made little advance upon their improvement of a week ago. As before indicated, however, it will require but a little increase in fares for the Underground Electric Railways of London to find all the difference between loss and profit, and, when this aspect becomes more generally recognised, the company's 6 per cent. income bonds will not remain at their present price of 59½ for long.

The American Marconi Company has notified that a further and final extension has been made to June 30th as the last day upon which certificates in the company can be received in New York for exchange into the shares of the Radio Corporation of America. It may be recalled that holders of American Marconi will receive one new ordinary and one new preferred in exchange for one American Marconi share. Moreover, the old certificates will be returned to the proprietor, to be held in case there may be any residue of assets left over in respect of matters at present in suspense. When a market starts in the new shares, it is likely that there will be active dealings in them, but further delay has occurred in obtaining permission to start transactions. The parent shares, after dipping to 3 9/16, recovered to 3 11/16. The new shares and the preference, both at 3¼, show little change on the week. Marines remain at 38s. 9d. In the cable market, the Eastern group continues to be somewhat heavy. In reply to a good many inquiries on the subject, it may be as well to point out that there is comparatively little difference, relatively speaking, between the old and the new issues of the four principal companies, though, of course, the new shares, standing at lower-looking prices, appear to be rather more attractive. The Eastern Company has declared its usual quarterly dividend of 2½ per cent., and the Eastern Extension 5s. a share. Globe preference hardened to 8¾. The company's report shows an increase of £36,000, at £264,000, in the net revenue for the year just ended.

The Mexican list is decidedly harder. Advices have been received to the effect that the Mexican Railway Company has been officially handed back to its proprietors. This gave a fillip to all Mexican issues, and most of the Government railway and utility descriptions are substantially better on the week. Business, however, is very quiet, and the improvements are the result more of sentiment than orders. Competent experts in the Stock Exchange declare that the present Mexican administration gives more substantial hopes for settlement of the country than they have seen for several years past, and it is claimed that the present governors are proceeding upon businesslike and sensible lines in the direction of restoring order in Mexico. In the circumstanes, it is not surprising to find Mexican Light and Power first bonds 3½ up at 46, while the seconds have risen to 27½ and the preferred to 21½. Pachuca bonds at 36 are 3 to the good. Mexico Tramway bonds of both classes are 3 higher. Elsewhere, British Columbia preferred and deferred are again noticeably better, there being a good deal of quiet buying of the semi-investment order. Brazilian Tractions have fallen to 47, this being due partly to financial weakness in Paris.

In the electrical supply market, Charing Cross and Kensingtons are both lower, but City of Londons hardened up a little to 24s. 4½d. The British Electric Traction report had no effect upon the price of the stocks. Some people hoped for rather better figures to be shown, but the dividend, as already mentioned, has been raised from 3 per cent. to 4 per cent., and the price of the ordinary is left at 35 middle, the 6 per cent. cumulative participating preference being 62½. The company's 5 per cent. first debenture changed hands on Monday at 67, and the 4½ per cent. second debenture stock is quoted 57½ middle. London United Tramways 4 per cent. debenture stock can be bought at 37. Armament shares are still dull. An issue of short-term notes bearing interest at 6½ per cent. is expected from the Armstrong Company, at par. Several engineering and similar issues have spurted sharply during the past few days. Babcock & Wilcox, however, remain at 2⅝. Metropolitan-Vickers preference eased off to 2½. Rubber shares are quiet, the steadiness of the raw material being put forward as the reason why the principal shares vary so little in price from day to day. Business throughout the Stock Exchange is far from active, and the tone may best be described as mixed.

POWER FACTOR FROM THE BUSINESS MAN'S POINT OF VIEW.

[SOME COMMENTS FROM A CORRESPONDENT.]

A SIMPLE explanation of a subject may contain incomplete statements, but it ought not to include any that are misleading or open to question with regard to their correctness. There are so many parts of Mr. Turnbull's article on Power Factor in the ELECTRICAL REVIEW for June 4th, 1920, that seem to be both incorrect and misleading that some comment on them is necessary. Supply companies are indeed desirous of charging for the units they deliver on a sliding scale based on power factor, but surely the difficulty is rather the lack of a meter which will register adequately according to such a scale than the impossibility of making the consumer pay for something he does not understand. We all pay for things that we neither understand nor ever think of trying to understand; we are doing so now for services alleged to be rendered in connection with cheese and coal and clothes and many other things beginning with "c," besides several that do not begin with "c." Why is wattless current any more "elusive" than any other sort of current? And does any consumer actually "understand" what he is paying for, even in the simplest case? If wattless current is explained so that it is "elusive," it is not necessarily the fault of the consumer or of the current.

For wattless current, in spite of what Mr. Turnbull suggests, has a useful function. The analogy of the bank is almost altogether fallacious. The £30 that is bandied about is of no use either to the bank or to the customer, but the "oscillating current," to use Mr. Turnbull's good and illuminating phrase, is of so much use to the motor that it would not be a motor at all without it. It is, in fact, its magnetising current, and is, therefore, absolutely essential to its working. So it is not correct to write of a motor drawing more current from the mains than it requires. It draws all the time just what it needs, neither more nor less. It is perfectly true that, other things being equal, an alternating current motor will take more current from the mains, the lower its power factor is, but the whole problem is one of compromise, and is solved by answering the question whether it is cheaper to put copper in the mains and elsewhere to accommodate the larger current, or to provide a more expensive motor which will work with less current? And the fact that induction motors without power factor correction are so largely used seems to show that that is, on the whole, the cheapest practice in the case of alternating current supply. But if certain consumers are utilising an undue share of the mains and plant by having motors with an abnormally low power factor, they should be asked to pay something towards the cost of the plant that they use more than their neighbours. Even then, it may be cheaper for them to do so than to improve their power factor.

There is apparently some confusion between horse power and current in parts of the article. An "ordinary measuring instrument," presumably an ammeter, would show a greater current than would be taken at unity power factor, but what "ordinary measuring instrument" will show a consumption of 130 H.P. in a circuit using only 100 H.P.? If it does, its place is in the repair shop or on the scrap heap. An indicator diagram taken from the engine driving the generator would not show it, except that a little extra power is used to supply the losses due to the additional current. The article describes a motor which takes 130 H.P. from the mains, and returns 30 H.P. to the mains as an "oscillating power." But it is not correct to say that the motor takes 130 H.P.; its continuous demand from the mains is for just enough power to keep it doing its required work. The reference is, no doubt, to a motor which, if it had a 100 per cent. power factor, would take a certain current, say, 100 amperes, but actually takes 130 amperes, because its power factor is less than 100 per cent. Mr. Turnbull seems to suggest at several points that 30 amperes is the value of the "oscillating current" in such a case; it is, however, really 83.1 amperes.

It is perfectly true that means can be used to prevent the "oscillating currents" in the supply mains; but "oscillating currents" must be provided somewhere, to act as magnetising currents, and if they are not in the supply mains they must be elsewhere. Here is the crux of the whole matter: Mr. Turnbull says that while these correcting devices "cost money, they bring about a great saving in the cost of supply, which is naturally beneficial to users of electric motors." But no: it is not "naturally" beneficial. It is beneficial only if the cost of the improvement is less than the cost of doing without it. Had these correcting devices been as cheap as Mr. Turnbull suggests, would not supply companies have provided them to counteract the baleful effects of these horrid motors? And is there not at least a case for examination, in view of the fact that the supply companies have not made a general provision of them, whether the additional plant and mains that are required to supply current to "imperfect" motors are not cheaper than smaller plant and "perfect" motors? Of course, if the consumer is going to pay for the improvement the supply company will no doubt be able to make a joyful noise and say, "Behold the cheapness of our power!" But if I were to say to Mr. Turnbull, "Here is some excellent coffee. It costs but one penny a pound, but you will never taste coffee as good as this anywhere except here. Only, you must provide a solid gold cup to drink it from, as otherwise it will poison you." I believe Mr. Turnbull, being human, would prefer the old-fashioned coffee in the old-fashioned cup, and think it good enough; and he would be right. So let him tell the business man the whole story, lest the business man some day, with foaming mouth, turn and rend him, and his last state be worse than his first.

Even if a system had a 50 per cent. power factor, the cost of plant would not be doubled on account of the doubled current. The prime mover would be practically the same size, and an alternator does not double its price when its K.V.A. output is doubled; the estimate is, therefore, hopelessly fallacious. It is unfortunate to use the word "efficient" as it is used at the end of the article, because "efficiency" in connection with a motor has a special technical meaning that is wholly apart from the idea of power factor. But, even admitting that the "efficient" motor results in cheap energy, I do not want cheap energy unless I can use it cheaply; and I do not find any help in the article towards a decision as to the total cost to me of the energy I am going to use. In fact, I think Mr. Turnbull's method would leave the consumer in as dense a fog, though possibly a different kind of fog, as any of the alternative technical explanations he rejects as useless.

And now, as fools rush in where angels fear to tread, I have my own suggestion to make. Were I the business man, without expert knowledge, to whom Mr. Turnbull was explaining things, I should be very content if he just said this to me: "It pays us, as a supply company, to use what is known as alternating current. Motors which use this current demand rather a large amount of it, but the current they take really represents less power than it would do if it were put into certain other kinds of apparatus, and the amount required by your motor of 100 H.P. on our system depends on the design of the motor. If we put in an ordinary meter, that meter will register, and you will pay for, just the power you actually use, and the amount of your bill will be practically the same, therefore, however your motor be designed in respect of its demand for additional current, so long as we decide to charge you

Digitized by Google

exactly on the indication of your meter. I can prove this to you experimentally, if you doubt it, but I am sure you will take my word for it as an expert. Only remember this: Although the meter will register according to the real power you take, and not according to the additional current I have told you of, we have to provide means to carry the additional current, and so we have to lay out more capital, and you, as a business man, know what that implies; we must have more revenue because of it. Now, the motor that demands less additional current is more expensive to buy than the motor that demands more; if, therefore, you like to put in the more expensive motor, and so really allow us to increase the capacity of our plant without increasing its size, we shall ask you to pay us less per unit than your neighbour, whose motor requires more current for the same power, even though his meter registers the same as yours, because he has used more of our plant in doing the same work. The total cost to you, allowing for the interest on your additional outlay, will be about the same, but you will be helping us, and I am sure you will be glad to do that." Then I, as a plain business man, should say to Mr. Turnbull: "You, too, are evidently a business man, and I understand clearly what you have told me. I am perfectly willing to help you, especially if it is going to cost me nothing." So I should get from him his tariffs, and ask the manufacturers for comparative prices for different designs of motors, on the lines of Mr. Turnbull's explanation; and I should strike a nice balance between debit and credit, and might even feel the richer because of the glow of satisfaction within my bosom that at last this matter was clear to me. So we should all be happy; and blessed above all men would be Mr. Turnbull, who had shed light on my darkness, and yet had never once mentioned power factor in all that he had said.

FRENCH RAILWAY ELECTRIFICATION.

THE French Minister of Public Works formed in November, 1918, in accordance with the upper chamber of Public Works, a committee to examine the propositions submitted by the railway systems of the Paris-Lyons-Mediterranean, the Orleans, and the Midi for the electrification of about 10,000 km. of the lines of their systems. The committee sent a commission of Government and railway engineer specialists to the U.S.A. in order to study American practice. Apart from the general duty of the Mission, consisting of collecting documents on railway electrification and the distribution of electricity at high pressure, its principal duty was to find out, on summing up all the information gained by study of the Swiss and Italian electric railways on one side and the American on the other, if a system of electric traction existed for large railways distinctly superior to all others, and able to be adopted to the exclusion of all others by all the different companies interested for the projected electrification in the centre and South of France.

From the four systems in operation, *i.e.*, single-phase, 3-phase, single-to-3-phase, and H.T., D.C., the 3-phase had already been studied in Italy, where it is largely used, but not to any appreciable extent elsewhere. The single-phase had been equally studied in operation in France on the Midi railway and in Switzerland on the Loetchberg lines, and in construction on the Swiss Federal Railways, which have adopted this system for the gradual electrification of all their systems, and in course of construction, for the Gothard railway. The single-to-3-phase and the H.T., D.C. systems are used mostly in the U.S.A., and so became the principal object of the Mission's work. At the same time the examination of American single-phase installations (25-cycle, while the analogous French installations are 16-cycle) completed the study of monophase installation.

Information gathered in the U.S.A. forms the subject of a detailed report by M. Manduit, secretary of the Mission, and Professor of the Faculty of Science of the University of Nancy, France, of which a translated summary from the *Journal Official de la Republique Francais*, August 13th, 1919, is given in the *General Electric Review*. Briefly, the chief points set out are as under:—

The principal lines equipped with monophase current in America are suburban lines, but the system is applicable to larger lines, and is the same as that of the French Midi, save that the frequency is 25 instead of 16 cycles. The American monophase installations, especially on account of the high frequency adopted, and the employment of motors often not so good as those found on the Midi and in Switzerland, showed an installation less perfect than similar ones in Europe. At the same time the struggle against interference with telephone and telegraph lines has been carried to considerable perfection; also the trolley lines with catenary suspension are remarkably well made. The assembled experience of France, Switzerland, and America points to the conclusion that the monophase system is still far from presenting the solution to a number of problems insufficiently solved in actual practice, notably the production of a motor capable of exerting a heavy torque for a considerable time without rotating in order to be able to start heavy trains on important grades, and of regenerative braking. Furthermore, the system leads to complicated equipment for the protection of neighbouring telephone circuits, which considerably augments the cost of installation. Without this consideration the cost would be distinctly less than similar costs with the 3-phase and H.T., D.C. systems. The expenses of maintenance of the rolling stock are always higher than in the latter two systems, and the motors are less rugged and capable of less overload.

The single-to-3-phase, or split-phase, system is only employed on one line, namely, from Bluefield to Vivian on the Norfolk and Western Railway in the Appalachian mountains in Virginia, U.S.A., for a length of 48 km., with two or three tracks, and numerous curves and grades reaching 20 mm. per metre. The locomotives are flexible and robust, but their operation brings out mechanical and electrical faults which have not been corrected up to the present in an adequate fashion, and on account of which the installation may be considered to be as yet only in the test period. The maintenance expense of the rolling stock is greater than that of other systems. The system, which on first sight appears very interesting, has not yet fulfilled the hopes that were held out at the commencement.

The greater part of the inter-urban lines in the U.S.A. operate at 1,200 volts D.C. with an overhead trolley wire, and many of them are really railways with both passenger and freight traffic, and speeds of 60 to 80 km. P.H. are attained. The equipment for this voltage is now as standard as that for tramways. Equal success has attended the use of 2,400 and 3,000 volts. All members of the Commission were unanimous in considering that the Chicago, Milwaukee, and St. Paul electrification, by far the most important in the world, was at the same time greatly superior to all others on account of the excellence of its technical operation from all points of view.

Three-phase power at 100,000 volts is converted by motor-generators, each of which consists of a synchronous motor and two D.C. generators mounted on the same shaft and coupled electrically in series in such a manner that each produces only 1,500 volts at the commutator. The sub-stations are the most delicate and the most costly part of this traction system, but they only number 14, about one to every 50 km., and they operate excellently, requiring only three men each for continuous operation with capacities of from 4,000 to 6,000 KW. By the use of flash barriers on the commutators and of high-speed circuit breakers in the main line accidents resulting from flash overs have been eliminated. The excellence of the installation of these sub-stations accounts for a good deal of the success obtained by the H.T., D.C. project.

At the relatively low pressure of 3,000 volts on the trolley wire experience shows that with a double trolley wire and a pantograph trolley with a double shoe and quadruple contact a current of 2,000 amperes is easily obtainable at a speed of 80 to 95 km. P.H., and 4,000 amps. at 25 km. P.H., which is more than sufficient for the heaviest trains and the highest powers. The locomotives are very easy to run and operate perfectly, the series D.C. motors being the ideal type for traction purposes. They are capable of regenerative braking, marvellously regulated, which assures the most flexible progress on down grades and occasions an important economy of power, wheel tires, and brake shoes. A single armature winder with an assistant assures the operation of the 336 motors of the 42 locomotives in the service. A single locomotive is sufficient to haul passenger trains of 1,000 American tons, even on grades of 20 mm. per metre. Freight trains of 2,800 American tons are hauled by a single locomotive on grades of 10 mm., the tractive effort being then 32.8 metric tons. In trains hauled by two locomotives, the second machine is placed in the middle of the train and not at the end; in America all freight trains, like the passenger trains, are provided with an automatic air brake on every car. A considerable advantage of the D.C. system is that the interference with telegraph and telephone lines is insignificant. In spite of the losses due to conversion from 3-phase to D.C., the efficiency of the system is good; 27 watt-hours per metric ton km., which corresponds to an over-all efficiency of 50 per cent. from the point of purchase from the producer up to the point of consumption.

With regard to the conclusions come to relative to the choice of an electric traction system, the writer of the report, on account of the remarkable results in America with 3,000-volt D.C., "does not hesitate to formally conclude in favour of the adoption of this system," and he believes it to be "actually the only system suitable for the electrification of heavy traction lines." The D.C. system presents the inconvenience of being a little more expensive in first cost, on account of the rotary sub-stations required, but this is balanced by the fact that frequency changers would have to be employed if the single-phase system were adopted in France.

Digitized by Google

So far as the expense of operation is concerned, the difference would not be great, and would not come into consideration in the choice of the system.

It is possible that with the single-phase system, which at the first glance shows the advantage of lending itself to a large variety of combinations, satisfactory operation may some day be obtained, but it is, without a doubt, a fact that the actual practice is far from being desirable at the present time.

Despite certain advantages obtained in Italy with the 3-phase system, it is the opinion of the Mission that it should be rejected, especially in consequence of the complexity and of the high price of installation and maintenance of the two trolley wires.

WATER POWERS OF BRITISH COLUMBIA.*

THIS is one of the most remarkable of the series of official publications yet issued by the Canadian Commission of Conservation, a series which deserves to be more widely known than is at present the case. It is now just over ten years since the Commission commenced its investigation of the character and extent of the various natural resources of Canada. A preliminary report in 1911 merely made evident the paucity of information concerning the water power resources of Manitoba, Saskatchewan, Alberta, and British Columbia. The deficiency so far as concerned the first-named three provinces was made good by a report published in 1916, and the present volume (which completes the programme undertaken in 1910) is a compendium of data relating to the water power resources of British Columbia. The physical difficulties of investigating streams in this province are immense, and the season available for useful reconnaissance is very short, since the work has to be performed when the streams are neither approaching nor at their floor. The greater credit is consequently due to the engineers responsible for collecting the data presented.

The opening chapters comprise a statement of guiding principles which should govern the conservation and utilisation of water power, and a description of the more important features which should characterise reliable water power data. This information is of quite general applicability, and experience has shown that loss of time and waste of effort have resulted from ignorance or imperfect knowledge of these fundamentals. The abnormal price and short supplies of coal during recent years have aroused widespread interest in water-power possibilities. In so far as the latter are technically and commercially sound propositions, this awakening of interest is all to the good, but the idea is still too prevalent that wherever there is running water there is boundless energy to be had at next to no cost. Mistakes of this nature are by no means confined to the general public; for instance, during ten or twelve years preceding 1915, eighteen large hydroelectric plant in the U.S.A.—totalling over 600,000 developed horse-power, and involving about $125,000,000 investment—proved financially unprofitable. It is stated that most of these failures have resulted from mistakes of engineers, especially in estimating the quantity of water available (the errors ranging from 30 to 200 per cent.), and in estimating the cost of development (some of the projects costing nearly twice the sum estimated). The possibilities of power development from coal must always be considered, both as regards direct competition with hydroelectric energy and as a means of supplementing the latter during periods of low water.

Naturally it is the low water flow which determines the maximum output which can be supplied continuously by a water-power station. Estimates should be based on records extending backwards for as many years as possible, and the normal ratio of flood to minimum flow must be determined. Owing to the vast natural storage capacity of the Great Lakes, the St. Lawrence river has a more uniform flow than any other large river in North America or probably in the world, the ratio of flood to minimum flow being only 2 to 1. On the Winnipeg river, above English river, the ratio is about 6 to 1; on the Ottawa river and on the Pend d'Oreille river (B.C.) it exceeds 15 to 1; on the Delaware river at Port Jervis (N.J.), it is 375 to 1; and there are, of course, many streams draining quite large watersheds which dry up during the summer. The importance of studying records relating to as long a period as possible is illustrated by the fact that the ratio of flood to minimum flow in the Columbia river at Dalles (Oregon) was 28 to 1 average for 37 years, and only 15 to 1 during the five-year period ending 1915. Obviously it would be easy to make serious mistakes even by the conservative application of data collected during a period of five years. Similarly a single century-old instance of backflooding may condemn a proposal to dam a stream. Another point which is emphasised in the present report is the importance of making the preliminary installation of dams and other main works with regard to the possible future development of more power than is at first required. Often a partial development unwisely planned has made subsequent full-development impossible save at prohibitive cost. The data and explanations given in this report make it easy for the engineer, and even for the non-technical financier, to determine how much useful information there is available concerning a proposed development, and to check the fundamental figures of flow, head, and storage on which depends the possible success of the scheme. Reliance should be placed only upon actual measurements, and great caution is needed if meteorological records are not available for a period of at least ten or fifteen years.

The voluminous data concerning the principal streams of British Columbia are, naturally, quite unsuitable for treatment in abstract. The province is divided into five main divisions, viz., t heColumbia river and its tributaries; the Fraser river and its tributaries; Vancouver island; the mainland Pacific Coast north of the Fraser (including the Skeena, Nass, and Stikine); and tributaries of the Mackenzie river. For each river and its chief tributaries, tables are presented specifying the watershed, head, and probable horse-power, and giving notes concerning the character of the ground and the probable method of development. In addition, there is a large number of tables of meteorological and hydrometric data and others referring to publications of all sorts bearing on water-power development in this district. In round figures there is from 2 to 3 million 24-hour horse-power available in the province, but this total must be considered in relation to a great number of factors and conditions which are enumerated in the report.

Needless to say, the report is absolutely indispensable to anyone concerned with hydroelectric projects in British Columbia and with the related subjects of domestic and municipal supply, agriculture and irrigation, navigation, fisheries and riparian rights. The report has also a wider function in that its preliminary chapters deal so admirably with general questions of water power legislation and policy, with the importance of maintaining the balance of Nature, and with the fundamental distinctions between water and water power. No pains have been spared to prevent the inexperienced or the unscrupulous promoter from foisting upon the public, projects which are commercially or both technically and commercially unsound. Whilst there are enormous quantities of water power still undeveloped in various parts of the world, it is also a fact that a large percentage of this power cannot be developed economically under conditions existent now, or likely to be existent, within the next century or so. It is desirable that water power be developed fully wherever this is economically possible, but, on the other hand, it must be remembered that "most of the best sites are already developed or held by various interests for future development," and that the residual power available for development with undoubted profit is strictly limited. Water-power rights should, therefore, be granted with circumspection and under proper safeguards. The dissemination of generalities concerning enormous amounts of potential water power is too often part of a plan to make easy the acquisition, by interested parties, of the most coveted privileges.

* "Water Powers of British Columbia." By A. V. White and C. J. Vick. 644 pp, 46 plates, 3 maps. Commission of Conservation, Ottawa, Canada. (1919.)

HYDROELECTRIC POWER TRANSMISSION FROM SWITZERLAND TO FRANCE.

IN the *Revue Générale de l'Electricité* for May 1st an account is given of a scheme which was carried out in 1918-19 to enable the Compagnie Lorraine d'Electricité to receive a supply of energy from the power station of the Société Motor de Baden, at Goesgen, on the river Aar. The distance is 185 km. (115 miles), and the pressure adopted was 110,000 volts, though provisionally the service is being carried on at 70,000 volts. The project was formulated under the pressure of war requirements at the beginning of 1918, by the Compagnie Générale d'Electricité, at the request of the Ministry of Munitions, and took the place of a previous scheme which had become unrealisable owing to the war; the frontier was to be crossed at Delle, near Belfort. The French and Swiss constructors were helped in obtaining the necessary material by the Motive Power Department of the Ministry, which enabled them to secure uniformity and quick delivery. The work was begun in July, 1918, and was completed in one year, the line being put into use on August 10th, 1919. The power to be transmitted was 20,000 H.P., necessitating a pressure of 110,000 volts, in order that with a power factor of 0.8 at Pouxeux, the transformer station of the Lorraine Co., the ohmic losses on the 185-km. line should not exceed 10 per cent., or the pressure drop 15 per cent., and the line was built for that pressure; but in order to supply the 70,000-volt network of the company without delay, the latter voltage was adopted for the time being.

The power station employs a fall of 17 m. (56 ft.) and a flow of 350 m.³ (12,360 cu. ft.) per second; it contains six sets of 7,600 H.P. each, out of eight provided for, and generates at 8,000 volts, 3-phase, 50 cycles per sec.

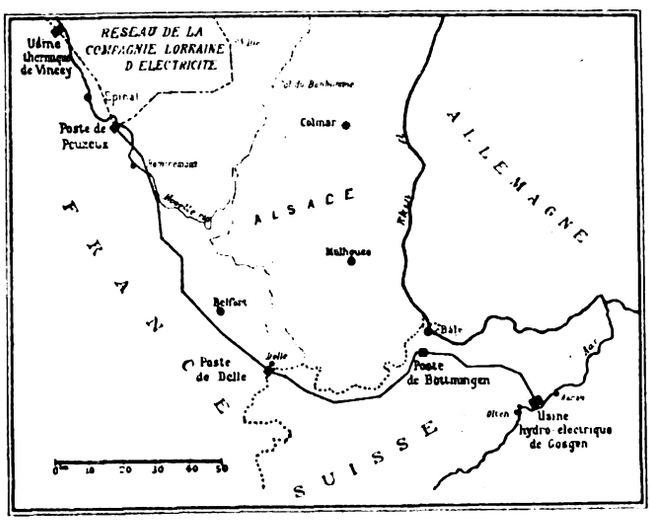
The line traverses mountainous and wooded districts, with about half its length in each country; at the frontier post at Delle the energy is metered. The highest point reached by the line is at Belfahy, in France, 825 m. (2,700 ft.) above sea-level, but it attains nearly the same elevation in Switzer-

Digitized by Google

land. It is carried on steel towers, and consists of three copper cables of 78 mm.² (0.12 sq. in.) cross section, supported by suspension insulators. A steel cable of 40 mm.² (0.062 sq. in.) cross section is suspended above the line and earthed at the masts. On the ground that the insulators are the weak points of a high-pressure line (45 per cent. of line faults are due to them) long spans were adopted, the most economical being found to be 180 to 200 m. (600 to 650 ft.); in some cases it was necessary to use a span of 300 m. (1,000 ft.), and on the Swiss side even upwards of 500 m. (1,600 ft.).

Two types of towers were used, one for straight runs and the other for anchoring and angles. The former has a safety factor of over 3, but at road crossings the span is shortened to give a factor of safety of 5; the weight of this tower is 1,300 kg. (2,866 lb.). The anchor tower weighs 2,500 kg. (5,512 lb.), and in both cases the tower is constructed in three sections bolted together. The height of the towers is 19.7 m. (64.6 ft.), and the lowest conductor is slung at 14 m. (46 ft.), so as to give a clearance of about 7 m. between the lowest point of the span and the ground. All the towers are fixed into concrete foundations. The conductors are suspended at the corners of a triangle measuring 3.25 m. (10.7 ft.) vertically, and 4.5 to 4.75 m. (15 to 15.6 ft.) on the other sides. To avoid possible contact between the cables, the supports of the two on the same side are staggered 500 mm. (20 in.). Each tower is provided with a copper earth-plate 400 by 300 by 2.5 mm. (16 by 12 by 0.1 in.). At railway crossings the cables are supported inside a rectangular lattice frame, with double chains of insulators.

Each chain consists of eight porcelain disk elements as a rule, but a ninth is added at anchor or angle towers; each disk is 250 mm. (9.84 in.) in diameter and weighs 3.6 kg. (8 lb.). The complete chain is 1.3 m. (4.26 ft.) in length. The breaking strain is 4.200 kg. (9,260 lb.), and brush discharge commences (over one element) at 50 kv.; sparking-over



Map showing the Route of the Line.

takes place dry at 70 kv., wet at 47 kv., and piercing under oil at 90 kv. With six elements, wet, sparking-over commences at 173 kv., and a complete chain of eight elements withstands over 350 kv. dry.

The copper cables have a resistivity of 1.78 microhms per cm. at 20 deg. C., and a breaking-stress of 36 kg./mm.² (51,000 lb. per sq. in.). The working stress does not exceed 8 kg./mm.² (11,400 lb. per sq. in.). The Schlick coupling sleeve is used for joints.

Anchor towers are provided at intervals of 1,000 to 1,200 m. Clearance avenues have been cut through the woods, so that a tree cannot fall on the line.

The line on French territory required 850 tons of steel in 542 towers, &c., of which 434 were of the straight-run type; 200 tons of copper, 29 tons of steel cable, 19,000 insulator elements, and 1,200 tons of cement. In the early stages the line was built by the labour of Kabyles and Moroccans, until demobilisation took place.

Sectioning stations are provided at four points, dividing the line into sections of about 20 km. (12 miles). At the receiving station, Pouxeux, electrolytic lightning arresters are installed in the open air. At the connecting station, at Delle, provision is made for putting in parallel the water-power station at Goesgen and the steam-power station of the Lorraine Co. at Vincey, for breaking the circuit, and for measuring the energy transmitted. The lines first pass through reactance coils combined with horn arresters, with three spark gaps, and a resistance of 10,000 ohms per phase. These are mounted on an external terminal derrick. Inside the station, on the upper floor are reactance coils, isolating switches and cut-outs for the instrument transformers. On the ground floor are the circuit-breakers, and instrument transformers.

Telephonic communication is provided at all terminal and sectionising stations.

It is interesting to note that parallel running between the steam station at Vincey and the plant at Goesgen, 230 km. apart, is effected without any difficulty.

AUTOMATIC TRAIN CONTROL.

An initial installation of automatic train control has recently been completed on the main line of the C.R.I. & P. Railway between Blue Island and Joliet, Ill., U.S.A., 21 miles of double track in dense passenger and freight traffic territory. The apparatus was designed and manufactured by the Regan Safety Devices Co. (Inc.), of New York and Chicago.

According to the *Railway Review*, the control system consists of two elements; the locomotive and tender equipment includes a shoe mechanism, speed controller, electro-pneumatic valve, relay, battery, and release switch. The roadside apparatus consists of a ramp located by the side of the track, battery, and relay, connecting the existing signal system.

The system embraces automatic speed control, as well as automatic stop features. It is of the intermittent electrical contact type, but arranged to carry continuous speed control through caution territory. In other words, having been actuated to provide speed control, it operates to restrict the speed of the train to a predetermined rate until conditions again necessitate unlimited speed or the train to stop, as the case may be, depending upon the position of the next signal. The speed controller is rigidly bolted to the end of the axle of the pony truck wheels and is contained in a dust-proof housing. It consists of a centrifugal governor arranged to open and close a circuit at any predetermined speed, which is set depending upon the class of traffic to which the locomotive is assigned. Connection is made to the controlling circuit through a stationary junction box to which is connected a flexible conduit; a ball bearing is provided to reduce friction to a practicable degree and to permit free movement of the condulet.

The electro-pneumatic valve, located at a point convenient for connection to the air brake system, operates in response to an electro magnet, and controls the brake pipe pressure and the reservoir supply to the engineman's brake valve. When the magnet is de-energised, the valve reduces the brake pipe pressure to ensure a service application of the brakes; at the same time it restricts the reservoir supply, so that the brakes cannot be released by the engineman's brake valve. The brake pipe pressure may, however, be still further reduced by the engineman in the same manner as with the conductor's emergency valve.

The shoe mechanism consists of a stem, a circuit controller and a cylinder housed in a substantial steel case which is rigidly bolted to the arch bar of the tender truck or to the trailer truck of the locomotive, as the case may be. The shoe is held in position and in contact while moving over a ramp by means of brake pipe pressure in the stem cylinder, to which the brake pipe is connected. The stem is cored, so that should it be broken, a service application of the brakes would result. The shoe circuit controller operates to substitute, in a normally closed circuit, energy from the roadside battery for that from the storage battery carried on the locomotive, also to transmit current of the proper characteristic from the roadside battery to actuate the locomotive apparatus and control the train consistent with the indication displayed by the block signal.

The storage battery is of the portable lead type and consists of five cells of 80 ampere-hours capacity, operating through resistance.

The relay is of a 3-position type connected into the circuit so as to repeat the position of the signal by means of electric currents of the several characteristics as may be transmitted by the roadside and locomotive apparatus.

The ramp is made up of angle iron, with a copper insert, suitably mounted upon cast iron supports which are rigidly bolted to the standard cross ties, a wood block separating the ramp iron from the support castings. This ramp is patented and very different from any ramp used elsewhere. It is 120 ft. long, and is located approximately 160 ft. in front of each signal. The ramp and the track are so connected with the signal system as to cause the signal to assume the stop position in case, for any reason, the ramp circuit is de-energised.

The signal system with which this train control system is operated is of the 3-position, D.C., upper quadrant, bottom-post mechanism, semaphore type operated by polarised line circuits. The relays and terminals for the ramp circuits are housed in the signal case or in a special relay box bolted thereto. Connection from the mechanism to the ramp is made through conduits.

In the operation of this system an application of the brakes is made by the automatic control apparatus when any of the following conditions exist: (*a*) When a train passes a signal in the caution position at an excessive speed. (*b*) Whenever a train exceeds a predetermined speed while running in a caution block. (*c*) At a stop signal, or when a block is occupied.

When an application of the brakes is made by the automatic control apparatus, release may be made with the system in service only:—

1. By automatic release, as in caution block territory, when the speed is below a predetermined point.

2. By automatic release, as when passing from caution block territory to a clear block.

3. By the engineman operating the release switch to pass a stop signal.

Digitized by Google

In the third case the train may then proceed, but only under automatic speed control, until the next block signal is encountered, when, if the block be clear, unlimited speed will be automatically restored.

No part of the automatic train control system is located in the engine cab, its operation being entirely independent of the engineman. It does not in any way interfere with the control or operation of the train by the enginemen so long as he obeys signal indications. It is intended to operate if, for any reason, the engineman fails.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY *cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

The Glory of the Day's Work.

Will you kindly allow me to say how very much I appreciate the article by "Femina" in your issue of June 11th, 1920, on "The Glory of the Day's Work."

If the sentiments therein expressed were firmly implanted in the hearts of everyone taking any part in the industrial life of our nation, and if one and all could realise the value of a day's work conscientiously accomplished, both to themselves and the community at large, most of our labour troubles would vanish, and a spirit of contentment with "our daily round and common task," would prevail.

I consider the article to be of great value in view of the present unrest prevailing.

Jay Gee.

The Electro-deposition of Iron.

My attention has been called to the article on the electro-deposition of iron appearing in your paper.

I should like to point out that the process originated in my works here. Some undersized gauges for tail shafts for the Admiralty were built up here, with very satisfactory results. This was communicated to the Air Board, with the result that a number of officials visited my works at Sunbury, and the process was taken up by them and developed for a variety of purposes during the war.

Sherard Cowper-Coles.

Sunbury-on-Thames.

Single-phase Meters on Three-phase, Three-wire Systems.

With reference to the article in the REVIEW of June 11th re "Single-phase Meters on Three-phase, Three-wire Systems," Mr. Solomon states a fact which ought to be well known to all qualified engineers who have to deal with measurement of A.C. power. He points out that the proper method is to use two single-phase meters connected on the two-wattmeter principle, or a three-phase two-element meter. He omits to mention the fact that three-phase power in a balanced three-phase three-wire circuit can be measured by creating an artificial neutral point by means of a star resistance and the use of a single-phase meter having a constant of 3.

If E is the star voltage and I the current in the corresponding meter element, the single-phase meter will read $E I \cos \phi$.

The total power will be $3 E I \cos \phi$.

Hence if the meter is geared so that the dial reads three times the power actually measured, the total three-phase power will be registered.

A Technical University.

Your editorial comment on the recent meeting for the formation of a technical university in London calls for some reply.

I will say little with reference to your views on the meaning and function of a university, except that these views are slowly dying out, but the point that I do wish to raise is in what manner the University of London fulfils your ideal. Where in this University "itself" is "*the polish which is imparted by constant association with one's fellows in the atmosphere inherent to a university*"? It may be found in some of the recognised schools of which the Imperial College is one group.

The degrees of London have been maintained at the highest standard, and are everywhere accepted as second to none, yet however highly one values the London degree, one cannot but remember that it may only represent a series of examinations without the solid background of a college training. In my early days, we at the Royal College of Science were taught, I think wrongly, to undervalue these diplomas, and some of us only regarded the University as a store for serving out degrees.

The present need is to provide a technical degree on a par with the bachelor, master, and doctor's degrees of the ordinary universities and known by these names and abbreviations, so that the ordinary commercial man and the man about town can understand something of the training of the holder without having to carefully obtain information of the relative merits of the A.R.C.Sc., A.K.C., B.Sc., &c. In provincial centres, as far as I know, the modern universities fulfil the needs of the times, but in London the case is wholly different, for here we have a large group of colleges combined for the purpose of technical education, more powerful than the University, and yet without the special privileges of a university.

Now, sir, having shown that the University of London (*fait accompli*) does not fulfil your own ideals as a university, I hope you will give the Imperial College of Science your influential support in its claim for a charter.

F. Peake Sexton.

Westminster.

[We refer to this subject in our leading columns.—EDS. ELEC. REV.]

What is the Contractor Doing?

I have read with great interest the article which, under the above heading, appeared in your issue of June 4th, and from many years' experience can fully endorse the remarks of your contributor.

"Electra," in his reply last week, agrees that there is every prospect of a great boom in electric cooking, but prefers to wait until the manufacturer has created the demand before doing anything himself to foster it.

This sums up the situation exactly, both are waiting for each other, with the result that much profitable business is lost. Have neither of them heard of "Co-operation"?

If this can be accomplished there will then be no need for further articles like the above, and I venture to suggest that their various associations could do much good by putting this subject on their agenda for discussion.

In the meantime the manufacturer can greatly help matters forward by providing the contractor with attractive showcards and non-technical pamphlets. He needs these to make sales as much as a miner does his pickaxe to obtain gold.

The contractor for his part must carry stocks, for it is most essential he should be in the position to satisfy his customer immediately, otherwise the opportunity may be lost.

With only these two things accomplished, sales will flow faster, but it still needs the high explosive of organised publicity to create the mighty volume, and this, in my opinion, can only be done by the co-operative efforts of the various associations.

What have they to say on the matter?

A. G. Blake.

June 21st, 1920.

Your articles headed "What is the Contractor Doing," and the subsequent correspondence interests us very greatly.

We feel that the contractor has, in the past, developed the wiring and engineering side of the business only, for the reason that the necessity of electric labour-saving appliances in the home was not apparent in view of the fact that domestic labour was plentiful and inexpensive. *Now* conditions have changed—domestic help is scarce and costly—those fortunate enough to secure any, must do as our American cousins have done in necessity, viz., purchase electric labour-saving appliances to retain the help—those less fortunate must have similar appliances to get along without it. In view of this "double market" which is crying out for appliances to aid domestic conditions, we are absolutely confident that the contractors will not fail to reorganise and develop the *commercial sales side* of their business, even more energetically than their friends in the States, who a few years ago, utilised their shop windows as more or less "rubbish dumps," but are now second to none as merchandising display windows. We, as manufacturers realise that without co-operation nothing worth while can be accomplished; hence our reason for having representatives continually in America keeping up with the times, and profiting by what has already been done. Now we have ready some of our co-operative sales help for the contractors' use, which will enable them to make good window shows of labour-saving appliances which will appeal to the womenfolk of this country.

It may interest your readers to know that we have complete window display material, showcards, life-size cutouts; also we are willing to loan electros to assist their local advertising, and supply advertising folders for distribution. This is only the beginning of what we intend to do to assist our contractor friends in their task of building up a sales organisation, which most certainly is necessary to them if they are to do their part in supplying the existing demands. The electrical contractor is as shrewd a business man as there is, and will most certainly profit by the unexpected opportunity which has arisen, and he *will do his share* and thoroughly.

Non-Union Labour and Supply Undertakings.

On behalf of the Rochdale Branch of the E.T.U., I am pleased to note that District Council, No. 10 Area (Greater London), is taking the same standpoint as we did on March 1st, 1920, and may say that it has been a great advantage to our membership, since our members on the supply staff refused to connect any job or installation done by plumbers and non-unionists. As noted in another part of your valuable journal, the Rochdale supply undertaking has established a record in lighting consumers during the year, and placed £5,000 to relieve the rates. We hope every E.T.U. branch will adopt this stand, which will guarantee quality and workmanship to consumers.

H. Turner,
Secretary.

Rochdale.

Technical Works.

Referring to the article of Mr. Purday, which appeared in your issue of April 30th, pressure of business at that time caused that particular issue to be put aside for later consideration; if not too late, I would like to make a few comments.

I fully appreciate Mr. Purday's feeling in the matter, having myself helped to get out technical work.

Generally speaking, when searching through technical books for any special information, one obtains, say, one ounce of hard fact out of 4 or 5 lb. of extraneous matter, which causes the cost to be considerable.

There are several books which, although very valuable in themselves, are too expensive to purchase for the small amount of special information in each.

Some works also which come out annually should be re-edited, and if before they were issued, the editor or compiler of such books would communicate with engineers (dealing practically with the various subjects) he would often obtain valuable assistance.

I know of one book which I sent for, and after some difficulty I found one paragraph dealing with the particular subject in which I was interested. This paragraph was incorrect and out of date.

There are very few books dealing specifically with one subject or branch of engineering, probably because the demand for them would not be satisfactory. Even when such a book is compiled, it is very advisable to carefully consider every page before issuing a new edition, as during the past five or six years there have been many changes.

For instance, in 1914, a technical book dealing with a certain speciality was issued, and a surplus stock of matter printed (but not bound up) ready to make up another edition in the following year, but in 1919, when a new issue was imperative, the surplus sheets were found to be very troublesome, owing to altered conditions, and it was necessary, for the time being, to insert a supplement; it now means an entire revision, and practically a new book.

Mr. Purday's suggestion that the date should always be inserted is very necessary. I adopted the plan of printing the year of issue on the cover.

I enclose copy of the technical book referred to, which perhaps you will forward to Mr. Purday.

Fred Bland.

Sheffield.

Government Waste.

In the Press at the present moment public attention is being directed to a series of articles under the above heading. While these are drawing forth criticisms from all quarters it would be entirely misleading for the public to consider that such wilful waste takes place in all Government departments, regarding the wages of their employés.

Some time ago an article in the REVIEW drew attention to the fact that certain individuals employed by the War Department in their power stations had not received any benefit under the E.P.E.A. Award No. 9,281. However, after more than 12 months' delay, these individuals were put in receipt of the above.

It would be interesting to know whether the Minister of Labour is aware of his sanction of an additional £30 per annum to be added to the above award. Up to the present it is a minus quantity, as far as the W.D. stations are concerned.

The same article also made reference to the workers now coming under the Whitley Council scheme.

The previous increases of 5s., 3s. and 3s., granted to these men has in practically all other concerns been paid, but not so to the workers of the War Department, as will be seen from the following.

Some weeks ago a conference was held between delegates of a certain union and a representative of the War Office to settle the question of wages. However, after the representative was informed that certain parts of the district had recognised the claim, the conference closed, the only result being a waste of time on both sides, as nothing is forthcoming.

It is argued that the party which approves and sanctions these awards cannot take the lead, therefore, the humble employés must sit tight and "wait and see" if there is anything left after the squandering is finished. The upset and discontent in various central stations between employer and employed cannot be wondered at when the very thing we are striving to conquer in this country at the present time is being put into practice by these Government departments.

But there is an end to everything, the inevitable clash is bound to come sooner or later, and the Government, as in the majority of cases, must be considered as the ringleaders of the present dissatisfaction amongst workers.

Otozel.

Distribution Mains for new Housing Schemes.

The article in your issue of the 18th inst., by Mr. Wilson, mains superintendent of Maidstone, is most valuable and timely.

The very arrangement of the new colonies, giving as it does more space between the houses and more irregular outline than the stereotyped form of street, increases the cost of service work, and consideration of this distribution problem to small properties is urgently required.

Some years ago an opportunity arose for providing electricity supply to a new and comparatively large estate of small villas, built, however, on comparatively old-fashioned lines; that is to say, in rows, and with small gardens.

In this case the supply was distributed in the form of single-phase A.C., and the method adopted—which proved inexpensive and satisfactory—was to lay down each side of each road one lead-covered armoured cable consisting of four cores, two outers and one neutral for balanced three-wire single-phase supply, and in addition one switch wire for public lighting.

This cable was not looped into the houses, services being put on in the old-fashioned manner with "T" joints.

The public lamps were also connected in the same way, but through the switch wire so that a large number could be turned "on" and "off" in groups from a central point.

At the junctions of roads a public lamp was fitted, the post having a special and enlarged base containing simple link gear to which the various cables at that point were brought, constituting in fact a small feeder pillar.

This arrangement worked very well, permitting services to be put on from time to time with minimum expense, made sectionising and testing easy, and provided for an inexpensive form of street lighting control.

The provision of a small switch wire in the main cable was probably not new, but is certainly worthy of attention even if public lighting is not immediately required, as the extra cost is very small. There are perhaps manufacturing difficulties in including the small switch wire in a cable of which the other cores are relatively large, but for the requirements of the ordinary housing colony, runs of ¼ to ½ mile from transformer kiosks, and work of that kind, the method offers many advantages.

The British Electrical Development Association, Inc.

London, W.C. 2.
June 21st, 1920.

Situations Vacant.

With reference to the correspondence appearing in the ELERTRICAL REVIEW with regard to the use of box numbers by advertisers, I think that it will interest your readers to consider the question from the advertiser's point of view.

I wish first of all to state that I am not an employer, but an employé (also a trade unionist) engaged by a large firm of engineers. Amongst my duties for my principals I have to engage assistants for various positions.

During the past years, having read many letters in the ELECTRICAL REVIEW on the much-debated subject of using box numbers by advertisers, I sided with the views expressed by your many correspondents, that this system of advertising vacant positions was a pernicious one. I therefore determined when advertising to use my firm's name and address; but after a few trials I had to revert to the box number again, as the results obtained by giving a name and address can hardly be credited. In reply to an advertisement, I have received at times hundreds of applications for a job, and then the trouble commences. Customers and friends will telephone or write asking that their friend Mr. So-and-So should be given the appointment, rarely discriminating whether the man's qualifications are suitable or not. I am not exaggerating when I state it is the rule rather than the exception to get a large number of these appeals, and in addition, although an advertisement may distinctly state that application is to be made by letter only, applicants from near and far will persistently call, resulting in a great loss of time to themselves and the advertisers. Now, most of the firms that use a box number are manufacturers, and from the above facts one can easily realise it would not be good policy on their part to risk the goodwill of various customers and their friends by creating disappointment.

Again, on the question of "state salary," I am afraid that this is primarily attributable to certain applicants, who, when applying for a position, and where a definite salary is offered, endeavour to secure the job by offering to take it at a lower

Digitized by Google

figure. I am sorry to state that in my experience I have had such offers. Needless to state, with any reputable firm these applications find their way to the waste-paper basket. However, in these days, there should not be any trouble in the question of "state salary," as every staff engineer should join either the E.P.E.A. or the S.T.E., whose officials will assist them in every way on this particular point. My view is, that where an applicant replies to an advertisement under a box number he is fairly sure of a square deal, since his application is considered on his merits alone.

Resident Engineer.

[This correspondence is now closed.—EDS. ELEC. REV.]

Staff Salaries and Conditions of Service.

In the ELECTRICAL REVIEW of June 4th appeared a leading article headed "Situations Vacant," which, after commenting pithily on some of the practices of certain employers, issued an invitation to the Society of Technical Engineers to abandon its secretive attitude. In the same week's issue of *The Electrician* there appeared two leaderettes referring to the recently-made agreement between the employers and staffs of the electrical supply industry. The latter of these two articles sounded a note of warning about the dangers of standardisation of salaries.

During the last few months such comments, usually brief, and directed towards one particular section of the general problem, have become increasingly common, but so far no general résumé of the whole subject covered by the title above has appeared in any of the technical papers concerned.

I think we are justified in assuming from the evidence that the engineer, both electrical and mechanical, long-suffering though he may be, is at last becoming vocal under the pressure of conditions which, bad as they have been during the last two decades, are fast becoming almost intolerable.

There is a deal of confused thinking about the subject, and it will be my attempt in this article to focus attention upon what appear to be the fundamental points requiring consideration.

I think that the following summary will meet with the agreement of all concerned:—

1. That in relation to other professions and businesses demanding the same degree of education, training and sense of responsibility, the electrical engineer was very poorly paid even before the war, and his conditions of service were often unnecessarily harsh.

2. That advances of salary, especially in the higher grades, during the last five years, have been totally disproportionate to the increase in cost of maintenance of a home and family, and conditions of service have deteriorated rather than improved.

3. That only by raising the remuneration and improving the conditions of service of the *average* man shall we obtain a contented staff fitted to give its whole mind to its special task of increasing the efficiency of the joint action of Capital and Labour.

4. That whatever the defects and dangers of association may be it is an incontrovertible fact that association with other individuals and groups is usually necessary before any improvement in the conditions of the general mass of those affected can be secured.

5. That failing the central station staffs, which are represented by the E.P.E.A., no section of the industry has a staff association which is of the slightest use to it.

It may be said that the S.T.E. represents other sections of the industry, but it is at least doubtful whether this is really the case or not. In the opinions of many engineers who have watched the operations of this concern, both from the inside and the outside, it seems clear that as at present constituted and directed, this society is likely to be of very little use. I would go further, and would say that personally I have come to the conclusion that the symptoms indicate that it has fallen a victim to an infantile form of that most insidious of all association diseases, namely, paralysis.

In evidence of this, I call attention to the apparent abandonment by its Council of all attempts to adequately control the actions of its paid servants, and its failure to publicly proclaim a definite policy and secure the help of the technical journals and friendly employers.

The Society's public, or rather semi-public utterances, are chiefly noticeable for their contradictory character, and the fact that they never by any chance indicate that there is any real guiding principle or inspiration behind its efforts. At one of the propaganda meetings which I attended, the speakers, almost without exception, voiced adherence to a policy which it is complimentary to describe as wholly opportunist and unworthy of any association with any real idea of its own dignity or that of its members.

I fear that at present the S.T.E. is not merely useless, but is actually dangerous, because it is still occupying the time of men who might more usefully help a real and progressive association, and it is at the same time making enemies even amongst those employers who sympathise with the legitimate aims and objects of the profession as a whole.

In this connection it must not be forgotten that whilst many employers show that they fully appreciate the position, they, after all, are in the minority, and are restricted from giving full effect to their views by the force of competition, and occasionally by the operations of their various employers' associations.

The central station staffs agreement referred to above, should be welcomed by all electrical men, for the reason that if salaries and conditions can be improved in this branch, bound down as it is by limitations on its charges for services rendered, &c., these improved salaries will eventually form the base for further improvement in the other branches of the industry which are not so bound.

It may be argued that this will further increase the cost of manufacture, and contribute to the much talked of forthcoming "slump," but it does not seem to be generally realised that the increases of "staff" pay in electrical manufacturing industries have had only a microscopic effect upon the total cost of production.

The Electrician, in the article referred to above, drew attention to the dangers of standardising salaries, but surely this danger only exists if an attempt is made to bind down members of the association not to take more than the basic salary. I cannot, in the published reports referring to the agreement in question, find any indication that this stupid policy of the workmen's trade unions has even been contemplated. Provided that there is no such limitation it is obvious that the man above the average will still be able to command a higher salary than the basic rate, but whereas, if the normal rate were £500 he would have to consider himself well paid at £750, he would probably have no difficulty in obtaining £1,100 to £1,200 if the basic rate became, say, £800 to £900, and so on throughout all the grades.

I contend that wha tis required is a real live association governed and directed by men of reasonable but determined character, who could earn and maintain the respect of the employers' representatives, and who would be able to command the allegiance of their fellow employés. They must be men to whom principle means more than opportunism, and to whom secrecy as regards policy and negotiations is abhorrent.

Further, I think that the efforts of all men who have the interests of the industry at heart should be directed towards making both employés, staff, and what is usually called Labour, realise that the technical and management staffs in the engineering industry (and for that matter in all industries) are, and must remain, a *third party* in industry.

They cannot exist without Capital on the one hand, and Labour on the other; but nevertheless it is true that neither Labour nor Capital can produce anything without them except where the capitalists themselves possess both the necessary ability and time to direct their own businesses. Such cases are becoming more rare every year, although many cases of partial direction still exist.

The staffs cannot ally themselves entirely with Capital because they are after all in the position of workers, and they cannot ally themselves definitely with Labour, because they must stand as representatives or judges between Capital and Labour.

They cannot serve the best interests of either Capital or Labour unless they are impartial and free to form and voice independent opinions, and they cannot be impartial if they are members of an association controlled by either Labour or Capital. Nor, being sufficiently conscious of their own strength and requirements, need they take up any such false position.

Garton Le Roet.

June 20th, 1920.

[We regret that pressure upon our space compels us to hold over several letters until next week.—EDS. ELEC. REV.]

Oversea Transmission.—Mr. Aarstad, chairman of the Norwegion Waterfall Commission, has been asked about the standpoint he had assumed concerning the possible transmission of electrical energy from Norway to Denmark. In reply, he is reported to have stated that the question had been put before the Commission for the expression of an opinion, and they had recommended the dispatch of a friendly reply to Denmark's application for the appointment of a joint committee. There was no doubt, he said, that Norway could give a supply to Denmark, and the committee would have to consider the extent of such transmission, both technically and economically. He apprehended that the power would be very costly on reaching consumers in Denmark.

Electrical Workers and the Military.—Our Dublin correspondent writes: In connection with the decision of Dublin dockers not to handle military munitions or equipment, the North Wall electric crane men last week refused to work the crane for assisting the military in the discharge of stores which had arrived from Southampton by the s.s. *Agnes Duncan*. The military then commandeered the electric power house belonging to the Dublin Port and Docks Board, but the employés there refused to work the plant, and it was intimated that if the military themselves attempted to do so, the entire electric power at the port would be stopped by the men, all the other crane-drivers refusing to work. This would have led to general dislocation. Ultimately the military withdrew from the power house, and the employés resumed work there as usual. Later, the military discharged the cargo of the *Agnes Duncan* with the aid of the ship's steam winches and derricks.
